TRE

TREACLE. See MELASSES.

TREACLE-Beer. See SPRUCE.

TREACLE-Mustard. See CLYPEOLA.

TREASON, a general appellation, made use of by the law, to denote not only offences against the king and government, but also that accumulation of guilt which arises whenever a superior reposes a confidence in a subject or inferior, between whom and himself there subsists a natural, a civil, or even a spiritual relation; and the inferior so abuses that confidence, so forgets the obligations of duty, subjection and allegiance, as to destroy the life of any such superior or lord. Hence treason is of two kinds, *high* and *petty*.

High-Treason, or Treason Paramount (which is equivalent to the *crimen læse majestatis* of the Romans, as Glanvil denominates it also in our English law), is an offence committed against the security of the king or kingdom, whether by imagination, word, or deed. In order to prevent the inconveniences which arose in England from a multitude of constructive treasons, the statute 25 Edw. III. c. 2. was made; which defines what offences only for the future should be held to be treason; and this statute comprehends all kinds of high-treason under seven distinct branches.

“1. When a man doth compass or imagine the death of our lord the king, of our lady his queen, or of their eldest son and heir.” Under this description it is held that a queen-regnant (such as Queen Elizabeth and Queen Anne) is within the words of the act, being invested with royal power, and intitled to the allegiance of her subject: but the husband of such a queen is not comprised within these words; and therefore no treason can be committed against him.

Let us next see what is a *compassing* or *imagining* the death of the king, &c. These are synonymous terms: the word *compass* signifying the purpose or design of the mind or will; and not, as in common speech, the carrying such design to effect. And therefore an accidental stroke, which may mortally wound the sovereign, *per infortunium*, without any traitorous intent, is no treason: as was the case of Sir Walter Tyrrel, who, by the command of King William Rufus, shooting at a hart, the arrow glanced against a tree, and killed the king upon the spot. But as this compassing or imagination is an act of the mind, it cannot possibly fall under any judicial cognizance, unless it be demonstrated by some open or overt act. The statute expressly requires, that the accused “be

TRE

thereof upon sufficient proof attained of some open act by men of his own condition.” Thus, to provide weapons or ammunition for the purpose of killing the king, is held to be a palpable overt act of treason in imagining his death. To conspire to imprison the king by force, and move towards it by assembling company, is an overt act of compassing the king’s death; for all force, used to the person of the king, in its consequence may tend to his death, and is a strong presumption of something worse intended than the present force, by such as have so far thrown off their bounden duty to their sovereign: it being an old observation, that there is generally but a short interval between the prisons and the graves of princes. It seems clearly to be agreed, that by the common law and the statute of Edw. III. words spoken amount only to a high misdemeanor, and no treason. For they may be spoken in heat, without any intention; or be mistaken, perverted, or misremembered by the hearers; their meaning depends always on their connection with other words and things; they may signify differently even according to the tone of voice with which they are delivered; and sometimes silence itself is more expressive than any discourse. As therefore there can be nothing more equivocal and ambiguous than words, it would indeed be unreasonable to make them amount to high treason. And accordingly, in 4 Car. I. on a reference to all the judges, concerning some very atrocious words spoken by one Pyne, they certified to the king, “that though the words were as wicked as might be, yet they were no treason; for unless it be by some particular statute, no words will be treason.” If the words be set down in writing, it argues more deliberate intention; and it has been held, that writing is an overt act of treason; for *scribere est agere*. But even in this case the bare words are not the treason, but the deliberate act of writing them.

2. The second species of treason is, “if a man do violate the king’s companion, or the king’s eldest daughter unmarried, or the wife of the king’s eldest son and heir.” By the king’s companion is meant his wife; and by violation is understood carnal knowledge, as well without force as with it; and this is high treason in both parties if both be consenting; as some of the wives of Henry VIII. by fatal experience evinced.

3. The third species of treason is, “if a man do levy war against our lord the king in his realm.” And this may be done

by taking arms, not only to dethrone the king, but under pretence to reform religion, or the laws, or to remove evil counsellors, or other grievances whether real or pretended. For the law does not, neither can it, permit any private man, or set of men, to interfere forcibly in matters of such importance; especially as it has established a sufficient power for these purposes in the high court of parliament: neither does the constitution justify any private or particular resistance for private or particular grievances; though, in cases of national oppression, the nation has very justifiably risen as one man, to vindicate the original contract subsisting between the king and his people.

4. "If a man be adherent to the king's enemies in his realm, giving to them aid and comfort in the realm or elsewhere," he is also declared guilty of high-treason. This must likewise be proved by some overt act; as by giving them intelligence, by lending them provisions, by selling them arms, by treacherously surrendering a fortress, or the like.

5. "If a man counterfeit the king's great or privy seal," this is also high-treason. But if a man takes wax bearing the impression of the great seal off from one patent and fixes it to another, this is held to be only an abuse of the seal, and not a counterfeiting of it: as was the case of a certain chaplain, who in such a manner framed a dispensation for non-residence. But the knavish artifice of a lawyer much exceeded this of the divine. One of the clerks in chancery glued together two pieces of parchment; on the uppermost of which he wrote a patent, to which he regularly obtained the great seal, the label going through both the skins. He then dissolved the cement, and taking off the written patent, on the blank skin, wrote a fresh patent of a different import from the former, and published it as true. This was held no counterfeiting of the great seal, but only a great misprison; and Sir Edward Coke mentions it with some indignation that the party was living at that day.

6. The sixth species of treason under this statute is, "if a man counterfeit the king's money; and if a man bring false money into the realm counterfeit to the money of England, knowing the money to be false, to merchandise and make payment withal." As to the first branch, counterfeiting the king's money; this is treason, whether the false money be uttered in payment or not. Also if the king's own minters alter the standard or alloy established by law, it is treason. But gold and silver money are only held to be within this statute. With regard likewise to the second branch, importing foreign counterfeit money in order to utter it here; it is held that uttering it, without importing it, is not within the statute.

7. The last species of treason ascertained by this statute is, "if a man slay the chancellor, treasurer, or the king's justices of the one bench or the other, justices in eyre, or justices of assize, and all other justices assigned to hear and determine, being in their places doing their offices." These high magistrates, as they represent the king's majesty during the execution of their offices, are therefore for the time equally regarded by the law. But this statute extends only to the actual killing of them; and not to wounding, or a bare attempt to kill them. It extends also only to the officers therein specified; and therefore the barons of the exchequer, as such, are not within the protection of this act; but the lord keeper or commissioners of the great seal now seem to be within it, by virtue of the statutes 5 Eliz. c. 18. and 1 Will. and M. c. 21.

The new treasons, created since the statute 1 M. c. 1. and not comprehended under the description of statute 25 Edw. III. may be comprised under three heads. The first species relates to Papists; the second to falsifying the coin or other royal signatures, as falsely forging the sign manual, privy signet,

or privy seal, which shall be deemed high-treason (1. M. stat. ii. c. 6.) The third new species of high-treason is such as was created for the security of the Protestant succession in the house of Hanover. For this purpose, after the act of settlement was made, it was enacted by statute 13 and 14 W. III. c. 3. that the pretended prince of Wales, assuming the title of King James III. should be attainted of high-treason; and it was made high-treason for any of the king's subjects to hold correspondence with him or any person employed by him, or to remit money for his use. And by 17 Geo. II. c. 39. it is enacted, that if any of the sons of the Pretender shall land or attempt to land in this kingdom, or be found in the kingdom or any of its dominions, he shall be adjudged attainted of high-treason; and corresponding with them, or remitting money to their use, is made high-treason. By 1 Ann. stat. 2. c. 17. the offence of hindering the next in succession from succeeding to the crown is high-treason: and by 6 Ann. c. 7. if any person shall maliciously, advicely, and directly, by writing or printing, maintain, that any other person hath any right to the crown of this realm, otherwise than according to the act of settlement; or that the kings of this realm with the authority of parliament are not able to make laws to bind the crown and its descent; such person shall be guilty of high-treason.

The punishment of high-treason in general is very solemn and terrible. 1. That the offender be drawn to the gallows, and not be carried or walk; though usually (by connivance, at length ripened by humanity into law) a sledge or hurdle is allowed, to preserve the offender from the extreme torment of being dragged on the ground or pavement. 2. That he be hanged by the neck, and then cut down alive. 3. That his entrails be taken out, and burned while he is yet alive. 4. That his head be cut off. 5. That his body be divided into four parts. 6. That his head and quarters be at the king's disposal.

The king may, and often doth, discharge all the punishment except beheading, especially where any of noble blood are attainted. For beheading being part of the judgment, that may be executed, though all the rest be omitted by the king's command. But where beheading is no part of the judgment, as in murder or other felonies, it hath been said that the king cannot change the judgment, although at the request of the party, from one species of death to another.

In the case of poisoning, which is a treason of a different complexion from the rest, the punishment is milder for male offenders; being only to be drawn and hanged by the neck till dead. But in treasons of every kind the punishment of women is the same, and different from that of men. For as the natural modesty of the sex forbids the exposing and publicly mangling their bodies, their sentence (which is to the full as terrible to sense as the other) is to be drawn to the gallows, and there to be burned alive.

For the consequences of this judgment, see *ATTAINDER, FORFEITURE, and CORRUPTION of Blood*.

Petty or Petit Treason, according to the statute 25 Edward III. c. 2. may happen three ways: by a servant killing his master, a wife her husband, or an ecclesiastical person (either secular or regular) his superior, to whom he owes faith and obedience. A servant who kills his master whom he has left, upon a grudge conceived against him during his service, is guilty of petty treason: for the traitorous intention was hatched while the relation subsisted between them, and this is only an execution of that intention. So if a wife be divorced *a mensæ et thoro*, still the *vinculum matrimonii* subsists; and if she kills such divorced husband, she is a traitress. And a clergyman is understood to owe canonical obedience to the

Bishop who ordained him, to him in whose diocese he is benefited, and also to the metropolitan of such suffragan or diocesan bishop; and therefore to kill any of these is petit treason. As to the rest, whatever has been said with respect to wilful MURDER, is also applicable to the crime of petit treason, which is no other than murder in its most odious degree; except that the trial shall be as in cases of high treason, before the improvements therein made by the statutes of William III. But a person indicted of petit treason may be acquitted thereof, and found guilty of manslaughter or murder; and in such case it should seem that two witnesses are not necessary, as in cases of petit treason they are. Which crime is also distinguished from murder in its punishment.

The punishment of petit treason in a man, is to be drawn and hanged, and in a woman to be drawn and burned: the idea of which latter punishment seems to have been handed down to us from the laws of the ancient Druids, which condemned a woman to be burned for murdering her husband; and it is now the usual punishment for all sorts of treasons committed by those of the female sex. Persons guilty of petit treason were first debarred the benefit of clergy by statute 12 Henry VII. c. 7. which has since been extended to their aiders, abettors, and counsellors, by statutes 23 Henry VIII. c. 1. and 4 & 5 P. and M. c. 4.

TREASURE, in general, denotes a store or stock of money in reserve.

TREASURE-TROVE, in law, derived from the French word *trouver*, "to find," called in Latin *thesaurus inventus*, is where any money or coin, gold, silver, plate, or bullion, is found hidden in the earth or other private place, the owner thereof being unknown; in which case the treasure belongs to the king: but if he that hid it be known, or afterwards found out, the owner and not the king is intitled to it.

TREASURER, an officer to whom the treasure of a prince or corporation is committed to be kept and duly disposed of, in payment of officers and other expences. See TREASURY. Of these there is a great variety. His majesty of Great Britain, in quality of elector of Brunswick, is arch-treasurer of the Roman empire. In England, the principal officers under this denomination are, the lord high-treasurer, the treasurer of the household, treasurer of the navy, of the king's chamber, &c.

The lord high-treasurer of Great Britain, or first commissioner of the treasury, when in commission, has under his charge and government all the king's revenue which is kept in the exchequer. He holds his place during the king's pleasure; being instituted by the delivery of a white staff to him. He has the check of all the officers employed in collecting the customs and royal revenues: and in his gift and disposition are all the offices of the customs in the several ports of the kingdom; escheators in every county are nominated by him; he also makes leases of the lands belonging to the crown.

The office of lord-treasurer is now in commission. The number of lords commissioners is five; one of whom is the first lord, whose annual salary was formerly 283l. but is now 4000l.; and who, unless he be a peer, is also chancellor of the exchequer, and prime minister in the government of this country; the other lords commissioners have an annual salary of 1000l. each.

TREASURER of the Household, is an officer who, in the absence of the lord-treasurer, has power, with the comptroller and other officers of the Green-Cloth and the steward of the Marshalsea, to hear and determine treasons, felonies, and other crimes committed within the king's palace. See HOUSEHOLD. There is also a treasurer belonging to the establishment of her majesty's household, &c.

TREASURER of the Navy, is an officer who receives money out of the exchequer, by warrant from the lord high-treasurer, or the lords commissioners executing that place; and pays all charges of the navy, by warrant from the principal officers of the navy.

TREASURER of the County, he that keeps the county stock. There are two of them in each county, chosen by the major part of the justices of the peace, &c. at their general quarter session; under previous security given for the money entrusted with them, and the faithful execution of the trusts reposed in them.

TREASURY, the place wherein the revenues of a prince are received, preserved, and disbursed. In England the treasury is a part of the exchequer; by some called the *lower exchequer*. The officers of his majesty's treasury, or the lower exchequer, are the lords commissioners, one of whom is chancellor, two joint secretaries, private secretary to the first lord, two chamberlains, an auditor, four tellers, a clerk of the pells, officers of the receipt, a tally-cutter, &c. See each officer under his proper article, CHANCELLOR, TELLER, TALLY, &c.

Lords of the TREASURY. In lieu of one single director and administrator of his majesty's revenues under the title of *lord high-treasurer*, it is at present thought proper to put that office in commission, i. e. to appoint several persons to discharge it with equal authority, under the title of *lords commissioners of the treasury*.

TREBLE, in music, the highest or most acute of the four parts in symphony, or that which is heard the clearest and shrillest in a concert.

TREBUCHET, TREBUCKET, *Tribuch* (*Terbichetum*), a tumbrel or cucking-stool. Also a great engine to cast stones to batter walls.

TREE, a large vegetable rising with one woody stem to a considerable height. Trees may be divided into two classes, *timber and fruit trees*; the first including all those trees which are used in machinery, ship-building, &c. or, in general, for purposes of utility; and the second comprehending those trees valued only, or chiefly, for their fruit. It is not necessary to form a third class to include trees used for fuel, as timber is used for this purpose where it is abundant; and where it is not abundant, the branches of the timber trees, or such of them as are dwarfish, unhealthy, or too small for mechanical purposes, are used as fuel.

The anatomy and physiology of trees have already been given under the generic name PLANT and SAP. For an account of their natural history, see NATURAL HISTORY.

Certain trees, it is well known, are natives of particular districts; but many of them have been transplanted from their native soil, and now flourish luxuriantly in distant countries, so that it becomes a matter of very considerable difficulty to ascertain their original soil. The following rules are given for this purpose by the Honourable Daines Barrington.

1. They must grow in large masses, and cover considerable tracts of ground, the woods not ending abruptly, by a change to other trees, except the situation and strata become totally different. 2. They must grow kindly in copses, and shoot from the stool, so as to continue for ever, if not very carefully grubbed up. 3. The feed must ripen kindly; nature never plants, but where a succession in the greatest profusion will continue. Lastly, trees that give names to many places are probably indigenous.

The growth of trees is a curious and interesting subject; yet few experiments have been made to determine what the additions are which a tree receives annually in different periods of its age. The only observations which we have seen

on this subject worth repeating were made by the ingenious Mr. Barker, to whom the Philosophical Transactions are much indebted for papers containing an accurate register of the weather, which he has kept for many years. He has drawn up a table to point out the growth of three kinds of trees, oaks, ashes, and elms; which may be seen in the Philosophical Transactions for 1788. We shall give his conclusions.

"I find (says he) the growth of oak and ash to be nearly the same. I have some of both sorts planted at the same time, and in the same hedges, of which the oaks are the largest; but there is no certain rule as to that. The common growth of an oak or an ash is about an inch in girth in a year; some thriving ones will grow an-inch and a half; the unthriving ones not so much. Great trees grow more timber in a year than small ones; for if the annual growth be an inch, a coat of one-sixth of an inch is laid on all round, and the timber added to the body every year is its length multiplied into the thickness of the coat, and into the girth, and therefore the thicker the tree is, the more timber is added."

We will present our readers with a table, showing the growth of seventeen kinds of trees for two years. The trees grew at Cavenham in Suffolk.

No.		July 1785.		July 1786.		July 1787.	
		P. In.	F. In.	P. In.	F. In.	P. In.	F. In.

17	Lime	—	1 8½	—	1 10½	—	2 0

Trees sometimes attain a very great size: this must depend in a great measure on the richness of soil, but no less on the degree of heat. Indeed heat is so essential to the growth of trees, that as we go from the place within the polar circles where vegetation begins, and advance to the equator, we find the trees increase in size. Greenland, Iceland, and other places in the same latitude, yield no trees at all; and the shrubs which they produce are dwarfish; whereas, in warm climates, they often grow to an immense size. Mr. Marshall saw spruce and silver firs in the dock-yard in Venice above forty yards long, and one of thirty-nine yards was eighteen inches diameter at the small end. He was informed that they came from Switzerland.

The largest tree in Europe, mentioned by travellers, is the chestnut tree on mount Etna, already described under the article ETNA. It is a certain fact that trees acquire a very great size in volcanic countries. Beside the multitude of fine groves in the neighbourhood of Albano in Italy, there are many detached oaks twenty feet in circumference, and many elms of the same size, especially in the romantic way to Eastello, called the *Galleria*. In travelling by the side of the lake of Boffena, the road leads us through an immense number of oaks, spread upon beautiful hills. Where the lava has been sufficiently softened, they are clean and straight, and of a considerable size; but where the lava has not been converted

into soil proper for strong vegetation, they are round-headed, and of less bigness; however, taken all together, they make a magnificent appearance; and the spot itself ought to be ranked among the fine parts of Italy. The same may be observed of the small lake of Vico, encompassed with gentle risings, that are all clothed with forest trees.

Some yews have been found in Britain sixty feet round. Palms in Jamaica attain the height of 200 feet; and some of the pines in Norfolk Island are 280 feet high.

Of all the different kinds known in Europe, oak is best for building; and even when it lies exposed to air and water, there is none equal to it. Fir-timber is the next in degree of goodness for building, especially in England, where they build upon leaves. It differs from oak in this, that it requires not much seasoning, and therefore no great stock is required before hand. Fir is used for flooring, wainscoting, and the ornamental parts of building within doors. Elm is the next in use, especially in England and France: it is very tough and pliable, and therefore easily worked: it does not readily split; and it bears driving of bolts and nails better than any other wood; for which reason it is chiefly used by wheelwrights and coach-makers, for shafts, naves, &c. Beech is also used for many purposes; it is very tough and white when young, and of great strength; but liable to warp very much when exposed to the weather, and to be worm-eaten when used within doors; its greatest use is for planks, bedsteads, chairs, and other household goods. Ash is likewise a very useful wood, but very scarce in most parts of Europe; it serves in buildings, or for any other use, when screened from the weather; handspikes and oars are chiefly made of it. Wild chestnut timber is by many esteemed to be as good as oak, and seems to have been much used in old buildings; but whether these trees are more scarce at present than formerly, or have been found not to answer so well as was imagined, it is certain that this timber is now but little used. Walnut-tree is excellent for the joiner's use, it being of a more curious brown colour than beech, and not so subject to the worms. The poplar, abel, and aspen trees, which are very little different from each other, are much used instead of fir; they look well, and are tougher and harder. See QUERCUS, OAK, PRUNUS, ULMUS, PLATANUS, POPULUS, &c.

The goodness of timber not only depends on the soil and situation in which it stands, but likewise on the season wherein it is felled. In this people disagree very much; some are for having it felled as soon as its fruit is ripe, others in the spring, and many in the autumn. But as the sap and moisture of timber is certainly the cause that it perishes much sooner than it otherwise would do, it seems evident, that timber should be felled when there is the least sap in it, viz. from the time that the leaves begin to fall till the trees begin to bud. This work usually commences about the end of April in England, because the bark then rises most freely; for where a quantity of timber is to be felled, the statute requires it to be done then, for the advantage of tanning. The ancients chiefly regarded the age of the moon in felling their timber; their rule was to fell it in the wane, or four days after the new moon, or sometimes in the last quarter. Pliny advises it to be in the very instant of the change; which happening to be in the last day of the winter solstice, the timber, says he, will be incorruptible.

Timber should likewise be cut when of a proper age; for when it is either too young or too old, it will not be so durable as when cut at a proper age. It is said that oak should not be cut under sixty years old, nor above 200. Timber, however, should be cut in its prime, when almost fully grown, and before it begins to decay; and this will be sooner or later, according to the dryness and moistness of the soil where the

timber grows, as also according to the bigness of the trees; for there are no fixed rules in felling of timber, experience and judgment must direct here as in most other cases.

Great attention is necessary in the seasoning of timber. Some advise the planks of timber to be laid for a few days in some pool or running stream, in order to extract the sap, and afterwards to dry them in the sun or air. By this means, it is said, they will be prevented from either chopping, casting, or cleaving; but against shrinking there is no remedy. Some again are for burying them in the earth, others in a heat; and some for scorching and seasoning them in fire, especially piles, posts, &c. which are to stand in water or earth. The Venetians first found out the method of seasoning by fire; which is done after this manner: they put the piece to be seasoned into a strong and violent flame; in this they continually turn it round by means of an engine, and take it out when it is every-where covered with a black coaly crust; the internal part of the wood is thereby so hardened, that neither earth nor water can damage it for a long time afterwards.

Dr. Plott says, it is found by long experience, that the trunk or body of the trees, when barked in the spring, and left standing naked all the summer exposed to the sun and wind, are so dried and hardened, that the sappy part in a manner becomes as firm and durable as the heart itself. This is confirmed by M. Buffon, who, in 1738, presented to the Royal Academy of Sciences at Paris a memoir, intitled, "An easy method of increasing the solidity, strength, and duration of timber;" for which purpose he observes, "nothing more is necessary than to strip the tree entirely of its bark during the season of the rising of the sap, and to leave it to dry completely before it be to cut down."

By many experiments, particularly described in that essay, it appears, that the tree should not be felled till the third year after it has been stripped of the bark; that it is then perfectly dry, and the sap become almost as strong as the rest of the timber, and stronger than the heart of any other oak tree which has not been so stripped; and the whole of the timber stronger, heavier, and harder; from which he thinks it fair to conclude, that it is also more durable. "It would no longer (he adds) be necessary, if this method were practised, to cut off the sap; the whole of the tree might be used as timber; one of forty years' growth would serve all the purposes for which one of sixty years is now required; and this practice would have the double advantage of increasing the quantity, as well as the strength and solidity, of the timber."

The navy board, in answer to the inquiries of the commissioners of the land revenue, in May 1789, informed them, they had then standing some trees stripped of their bark two years before, in order to try the experiment of building one half of a sloop of war with that timber, and the other half with timber felled and stripped in the common way. This very judicious mode of making the experiment, if it be properly executed, will undoubtedly go far to ascertain the effects of this practice. We are sorry that we are not able to inform our readers what was the result of the experiment.

After the planks of timber have been well seasoned and fixed in their places, care is to be taken to defend or preserve them; to which the smearing them with linseed oil, tar, or the like oleaginous matter, contributes much. The ancients, particularly Hesiod and Virgil, advise the smoke-drying of all instruments made of wood, by hanging them up in the chimneys where wood-fires are used. The Dutch preserve their gates, portcullises, drawbridges, sluices, &c. by coating them over with a mixture of pitch and tar, whereon they strew small pieces of cockle and other shells, beaten almost to powder, and mixed with sea-sand, which incrusts and arms them

wonderfully against all assaults of wind and weather. When timber is felled before the sap is perfectly at rest, it is very subject to worms; but to prevent and cure this, Mr. Evelyn recommends the following remedy as the most approved: put common sulphur into a cucurbit, with as much aquafortis as will cover it three fingers deep; distil it to dryness, which is performed by two or three rectifications. Lay the sulphur that remains at bottom, being of a blackish or sand-red colour, on a marble; or put it in a glass, and it will dissolve into an oil; with this oil anoint the timber which is infected with worms. This, he says, will not only prevent worms, but preserve all kinds of woods, and many other things, as ropes, nets, and masts, from putrefaction, either in water, air, or snow.

An experiment to determine the comparative durability of different kinds of timber, when exposed to the weather, was made by a nobleman in Norfolk; of which an account is given by Sir Thomas Beever in the *Annals of Agriculture*, vol. vi. This nobleman, in the year 1774, ordered three posts, forming two sides of a quadrangle, to be fixed in the earth on a rising ground in his park. Into these posts were mortised planks, an inch and an half thick, cut out of trees from thirty to forty-five years growth. These, after standing ten years, were examined, and found in the following state and condition.

The cedar was perfectly sound; larch, the heart sound, but the sap quite decayed; spruce fir, sound; silver fir, in decay; Scotch fir, much decayed; pinaster, quite rotten; chestnut, perfectly sound; abele, sound; beech, sound; walnut, in decay; sycamore, much decayed; larch, quite rotten. Sir Thomas Beever justly remarks, that the trees ought to have been of the same age; and Mr. Arthur Young adds, they ought to have been cut out of the same plantation.

The immense quantity of timber consumed of late years in ship-building and other purposes has diminished in a very great degree the quantity produced in this country. On this account, many gentlemen who with well to their country, alarmed with the fear of a scarcity, have strongly recommended it to government to pay some attention to the cultivation and preservation of timber.

It has been proposed to appropriate such part of the crown-lands as are fit for the purpose solely for producing timber for the navy. This appears a very proper scheme in speculation; but it has been objected, that for government to attempt the farming of forests would be really to establish groups of officers to pocket salaries for doing what, it is well known, will never be done at all. But to this objection we reply, that such an agreement might be made with the inspectors of forests, as to make it their own interest to cultivate trees with as much care as possible. Their salary might be fixed very low, and raised in proportion to the number of trees which they could furnish of such a size in a certain number of years. After all, we must acknowledge, that we must depend greatly on Russia, Sweden, Norway, and America, for supplying us with timber; and while these countries take our manufactures in exchange, we have no reason to complain. Still, however, we ought surely not to neglect the cultivation of what is of so much importance to our existence as a nation, for it may often be impossible in time of war to obtain timber from foreign countries.

The following is the method proposed by Mr. William Forsyth for curing injuries and defects in trees; for which a reward was given to him by his majesty, on condition that he should make it public. It is equally applicable to forest as to fruit-trees.

Take one bushel of fresh cow-dung, half a bushel of lime rubbish of old buildings (that from the ceilings of rooms is

preferable); half a bushel of wood-ashes; and a sixteenth part of a bushel of pit or river sand. The three last articles are to be sifted fine before they are mixed; then work them well together with a spade, and afterwards with a wooden beater, until the stuff is very smooth, like fine plaster used for the ceilings of rooms. The composition being thus made, care must be taken to prepare the tree properly for its application by cutting away all the dead, decayed, and injured parts, till you come to the fresh sound wood, leaving the surface of the wood very smooth, and rounding off the edges of the bark with a draw-knife, or other instrument perfectly smooth, which must be particularly attended to. Then lay on the plaster about one-eighth of an inch thick all over the part where the wood or bark has been so cut away, finishing off the edges as thin as possible. Then take a quantity of dry powder of wood-ashes, mixed with a sixth part of the same quantity of the ashes of burnt bones; put it into a tin box, with holes in the top, and shake the powder on the surface of the plaster, till the whole is covered over with it, letting it remain for half an hour to absorb the moisture; then apply more powder, rubbing it on gently with the hand, and repeating the application of the power, till the whole plaster becomes a dry smooth surface.

All trees cut down near the ground should have the surface made quite smooth, rounding it off in a small degree, as before mentioned; and the dry powder directed to be used afterwards should have an equal quantity of powder of alabaster mixed with it, in order the better to resist the dripping of trees and heavy rains. If any of the composition be left for a future occasion, it should be kept in a tub or other vessel, and urine of any kind poured on it, so as to cover the surface; otherwise the atmosphere will greatly hurt the efficacy of the application. Where lime-rubbish or old buildings cannot be easily got, take powdered chalk, or common lime, after having been slaked a month at least. As the growth of the tree will gradually affect the plaster, by raising up its edges next the bark, care should be taken, where that happens, to rub it over with the finger when occasion may require (which is best done when moistened by rain), that the plaster may be kept whole, to prevent the air and wet from penetrating into the wound.

By this process, some old worn-out pear trees, that bore only a few small, hard fruit, of a kernelly texture, were made to produce pears of the best quality and finest flavour the second summer after the operation; and in four or five years they bore such plenteous crops, as a young healthy tree would not have produced in four times that period.

By this process, too, some large ancient elms, in a most decayed state, having all their upper parts broken, and a small portion only of the bark remaining, shot out stems from their tops, above thirty feet in length, in fix or seven years from the first application of the composition.

Thus may valuable fruits be renovated; and forest trees, which are useful or ornamental from their particular situation, be preserved in a flourishing state. But what is far more interesting, a perfect cure has been made, and sound timber produced, in oak trees, which had received very considerable damage from blows, bruises, cutting of deep letters, the rubbing off the bark by the ends of rollers, or wheels of caris, or from the breaking of branches by storms.

TREFOIL, in botany. See TRIFOLIUM.

TREMELLA, in botany: a genus of plants belonging to the class of *cryptogamia*, and natural order of *algæ*. It is a gelatinous membranous substance; the parts of the fructification scarcely visible. There are 11 species; of which five are indigenous; the noxious, lichened, verrucosa, hemispherica, and purpurea. 1. The *myces*, or jelly rain tremella, is found

in pastures and by the sides of gravel-walks in gardens after rains; not uncommon in spring, summer, and autumn. It is a membranaceous, pellucid, and gelatinous substance, without any visible root; of a yellowish dull green colour; assuming various forms, either round, angular, plaited or folded together irregularly, like the intestines, or a pocket-handkerchief, an inch or two or more in diameter: soft to the touch when moist; but thin, membranaceous, and brittle, when dry; and of a black fulvous colour.—The ancient alchemists called this vegetable the *flowers of heaven*, and imagined that from it they would procure the universal menstruum: but all their researches ended in discovering that by distillation it yielded some phlegm, volatile salt, and empyreumatic oil. It has been extolled in wounds, ulcers, &c. but no regard is ever paid to it by judicious practitioners. Dr. Darwin says, he has been well informed that this tremella is a mucilage voided by herons after they have eaten frogs!! 2. The *lichenoides*, or transparent tremella, is erect, plane, margin curled, lacinated, and brown. It grows on heaths and in woods, &c. 3. *Verrucosa*, or warty tremella, is tubercular, solid, wrinkled, roundish, and resembling a bladder; it is of a blackish yellow. It grows on stones in rivulets. 4. *Hemispherica*, or sea tremella, is scattered among conservæ, fuci, &c. 5. *Purpurea*, or purple tremella, is globular, sessile, solitary, and smooth. It grows on ditch-banks about London.

TRELLIUS (Emmanuel), a Jew by birth, was born at Ferrara in the year 1510. He was so carefully educated as to become a great master of the Hebrew tongue: he was converted to Christianity by the celebrated Peter Martyr. After travelling to Germany and England, he was made professor of Hebrew, first at Heidelberg, and then at Sedan, where he died in 1580. He translated the Hebrew Bible and Syriac Testament into Latin; in the former he was assisted by Junius, who afterwards corrected the second edition in 1587. This work was received by the Protestant churches with great approbation.

TREMOR, an involuntary shaking, chiefly of the hands and head, sometimes of the feet, and sometimes of the tongue and heart.—Tremors arising from a too free use of spirituous liquors require the same treatment as palsies.

TRENCHES, in fortification, are ditches cut by the besiegers, that they may approach the more securely to the place attacked; whence they are also called *lines of approach*.

TRENT, bishopric of, a province of Germany, in the circle of Austria, near the frontiers of Italy, is bounded on the north by Tirol; on the east, by the Feltrino and Bellunese; on the south by Vicentino, the Veronese, Bresciano, and the lake de Garda; and on the west, by the Bresciano and the lake de Garda. The soil is said to be pretty fruitful, and to abound in wine and oil.

TRENT, a city of Germany, and capital of the bishopric of that name, is a very ancient place, and stands in a fertile and pleasant plain, in the midst of the high mountains of the Alps. The river Adige washes its walls, and creeping for some time among the hills, runs swiftly into Italy. Trent has three considerable churches, the principal of which is the cathedral: this is a very regular piece of architecture. The church of St. Maria Major is all of red and white marble; and is remarkable for being the place where the famous council of Trent was held, whose decisions are now the standing rule of the Romish church. E. Long. 11. 5. N. Lat. 46. 10.

TRENT, one of the largest rivers in England, which rises in the Moorland of Staffordshire, and runs south-west by New-castle-under-Line; and afterwards dividing the county in two parts, runs to Burton, then to Nottingham and Newark; and so continuing its course due north to Gainborough on the

confines of Lincolnshire, it joins several rivers, and falls into the Humber.

TRENT (council of), in ecclesiastical history, denotes the council assembled by Paul III. in 1545, and continued by twenty-five sessions till the year 1563, under Julius III. and Pius IV. in order to correct, illustrate, and fix with perspicuity, the doctrine of the church, to restore the vigour of its discipline, and to reform the lives of its ministers. The decrees of this council, together with the creed of Pope Pius IV. contain a summary of the doctrines of the Roman Catholics. These decrees were subscribed by 255 clergy, consisting of four legates, two other cardinals, three patriarchs, twenty-five archbishops, 163 bishops, besides inferior clergy. Of these 150 came from Italy; of course the council was entirely under the influence of the pope. For a more particular account of the council of Trent, see *Mosheim's Church History*, the *Modern Universal History*, vol. XXIII. and *Father Paul's History of the Council of Trent*.

TRENTON. See *New Jersey*.

TREANNING. See *Surgery*.

TRES TABERNÆ (anc. geog.), a place in Latium, lying on the Via Appia, on the left or south side of the river Astura, to the north of the Paludes Pomptinæ. Its ruins are now seen near Cisterna, a village in the Campagna di Roma, twenty-one miles from Rome, whence the Christians went out to meet St. Paul.

TRESPASS, in law, signifies any transgression of the law; under treason, felony, or misprison of either: but it is commonly used for any wrong or damage that is done by any one private person to another, or to the king in his forest.

TRESSLE-TREES, in ship-building, two strong bars of timber fixed horizontally on the opposite sides of the lower main-head, to support the frame of the top and the weight of the top-mast.

TRESSURE, in heraldry, a diminutive of an orle, usually held to be half the breadth thereof.

TRET, in commerce, an allowance made for the waste or the dirt that may be mixed with any commodity; which is commonly four pounds in every 104 pounds weight.

TREVERI, or **TREVIRI** (anc. geog.), an ancient and a powerful people both in horse and foot, according to Cæsar; extending far and wide between the Meuse and the Rhine. Their chief town was called *Trevis*. Now *Triers* or *Trees*.

TREVES, or **TRIERS** (in Latin *Trevere*, *Trevers*, *Treviris*, or *Augusta Trevirorum*), the capital of a German archbishopric of the same name, stands sixty miles west of Mentz, fifty-two south of Cologne, and eighty-two north of Strasbourg. This city vies with most in Europe for antiquity, having been a large and noted town before Augustus settled a colony in it. It was free and imperial till the year 1560, when it was surprised and subjected by its archbishop James III. It stands on the Moselle, over which it has a fair stone bridge. The cathedral is a large building; and near it stands the elector's palace, which not long ago was rebuilt. Here are three collegiate and five parish churches, three colleges of Jesuits, thirteen monasteries and nunneries, an university founded in 1472, a house of the Teutonic order, and another of that of Malta, with some remains of the ancient Roman theatre. Roman coins and medals are often found in the ruins of the old city. In the cathedral they pretend to have our Saviour's coat and St. Peter's staff, to which they ascribe miracles. The private houses here are mean; and the city is neither well fortified nor inhabited. E. Long. 6. 41. N. Lat. 49. 45.

TRIAL, in law, the examination of a cause according to the laws of the land before a proper judge; or it is the man-

ner and order observed in the hearing and determining of causes.—Trials are either *civil* or *criminal*.

I. Civil Trials. The species of trials in civil cases are seven: by *record*; by *inspection*, or examination; by *certificate*; by *witnesses*; by *wager of battel*; by *wager of law*; and by *jury*. The first six are only had in certain special or eccentric cases, where the trial by jury would not be so proper or effectual: (see them explained under their respective titles). The nature of the last, that principal criterion of truth in the law of England, shall be explained in this article.

As trial by jury is esteemed one of the most important privileges which members of society can enjoy, and the bulwark of the British constitution, every man of reflection must be stimulated by the desire of inquiring into its origin and history, as well as to be acquainted with the forms and advantages by which it is accompanied. We will therefore begin with tracing it to its origin. Its institution has been ascribed to our Saxon ancestors by Sir William Blackstone.

“Some authors (says that illustrious lawyer) have endeavoured to trace the original of juries up as high as the Britons themselves, the first inhabitants of our island; but certain it is, that they were in use among the earliest Saxon colonies, their institution being ascribed by Bishop Nicholson to Woden himself, their great legislator and captain. Hence it is, that we may find traces of juries in the laws of all those nations which adopted the feudal system, as in Germany, France, and Italy; who had all of them a tribunal composed of twelve good men and true, *boni homines*, usually the vassals or tenants of the lord, being the equals or peers of the parties litigant: and, as the lord's vassals judged each other in the lord's courts, so the king's vassals, or the lords themselves, judged each other in the king's court. In England we find actual mention of them so early as the laws of King Ethelred, and that not as a new invention. Stiernhook ascribes the invention of the jury, which in the Teutonic language is denominated *nemda*, to Regner king of Sweden and Denmark, who was contemporary with our King Egbert. Just as we are apt to impute the invention of this, and some other pieces of juridical polity, to the superior genius of Alfred the Great; to whom, on account of his having done much, it is usual to attribute every thing: and as the tradition of ancient Greece placed to the account of their own Hercules whatever achievement was performed superior to the ordinary prowess of mankind. Whereas the truth seems to be, that this tribunal was universally established among all the northern nations, and so interwoven in their very constitution, that the earliest accounts of the one give us also some traces of the other.”

This opinion has been controverted with much learning and ingenuity by Dr. Pettingal in his Enquiry into the Use and Practice of Juries among the Greeks and Romans, who deduces the origin of juries from these ancient nations.

He begins with determining the meaning of the word *δικασται* in the Greek, and *judices* in the Roman writers. “The common acceptation of these words (says he), and the idea generally annexed to them, is that of *presidents of courts*, or, as we call them, *judges*; as such they are understood by commentators, and rendered by critics. Dr. Middleton, in his life of Cicero, expressly calls the *judices*, *judges of the bench*: and Archbishop Potter, and in short all modern writers upon the Greek or Roman orators, or authors in general, express *δικασται* and *judices* by such terms as convey the idea of *presidents in courts of justice*. The propriety of this is doubted of, and hath given occasion for this inquiry; in which is shown, from the best Greek and Roman authorities, that neither the *δικασται* of the Greeks, or the *judices* of the Romans, ever signified *presidents in courts of judicature*, or *judges of the bench*; but, on the contrary, they were distinguished from each other,

and the difference of their duty and function was carefully and clearly pointed out by the orators in their pleadings, who were the best authorities in those cases, where the question related to forms of law, and methods of proceeding in judicial affairs and criminal process.

The presidents of the courts in criminal trials at Athens were the nine archons, or chief magistrates, of which whoever presided was called *ἄρχων δικαστικός*, or president of the court. These nine presided in different causes peculiar to each jurisdiction. The archon, properly so called, had belonging to his department, all pupillary and heritable cases; the *βουλευτής* or *rex sacrorum*, the chief priest, all cases where religion was concerned; the polemarchus, or general, the affairs of the army and all military matters; and the six, the *smiths*, the other ordinary suits.

Wherever then the *ἀνδρες δικασταί*, or judicial men, are addressed by the Greek orators in their speeches, they are not to be understood to be the presiding magistrates, but another class of men, who were to enquire into the state of the cause before them, by witnesses and other methods of coming at truth; and after inquiry made and witnesses heard, to report their opinion and verdict to the president, who was to declare it.

The several steps and circumstances attending this judicial proceeding are so similar to the forms observed by our jury, that the learned reader, for such I must suppose him, cannot doubt but that the nature, intent, and proceedings of the *δικαστήριον* among the Greeks were the same with the English jury; namely, for the protection of the lower people from the power and oppression of the great, by administering equal law and justice to all ranks; and therefore when the Greek orators directed their speeches to the *ἀνδρες δικασταί*, as we see in Demosthenes, *Æschines*, and *Lyfias*, we are to understand it in the same sense as when our lawyers at the bar say, *Genlemen of the jury*.

So likewise among the Romans, the *judices*, in their pleadings at the bar, never signified judges of the bench, or presidents of the court, but a body or order of men, whose office in the courts of judicature was distinct from that of the prætor or *judex questorius*, which answered to our judge of the bench, and was the same with the archon, or *πρωτος δικαστικος*, of the Greeks: whereas the duty of the *judices* consisted in being impanelled, as we call it, challenged, and sworn to try uprightly the case before them; and when they had agreed upon their opinion or verdict, to deliver it to the president who was to pronounce it. This kind of judicial process was first introduced into the Athenian polity by Solon, and thence copied into the Roman republic, as probable means of procuring just judgment, and protecting the lower people from the oppression or arbitrary decisions of their superiors.

When the Romans were settled in Britain as a province, they carried with them their *jura* and *instituta*, their laws and customs, which was a practice essential to all colonies; hence the Britons, and other countries of Germany and Gaul, learned from them the Roman laws and customs; and upon the irruption of the northern nations into the southern kingdoms of Europe, the laws and institutions of the Romans remained, when the power that introduced them was withdrawn; and Montefquieu tells us, that under the first race of kings in France, about the fifth century, the Romans that remained, and the Burgundians their new masters, lived together under the same Roman laws and police, and particularly the same forms of judicature. How reasonable then is it to conclude, that in the Roman courts of judicature continued among the Burgundians, the form of a jury remained in the same state it was used at Rome. It is certain, Montefquieu, speaking of those times, mentions the *paires* or *hommes de fief*, homagers or peers, which in the same chapter he calls *juges*, judges or

jurymen; so that we hence see how at that time the *hommes de fief*, or "men of the fief," were called *peers*, and those *peers* were *juges* or *jurymen*. These were the same as are called in the laws of the confessor *peers de la tenure*, the "peers of the tenures, or homagers," out of whom the jury of peers were chosen, to try a matter in dispute between the lord and his tenant, or any other point of controversy in the manor. So likewise in all other parts of Europe, where the Roman colonies had been, the Goths succeeding them, continued to make use of the same laws and institutions, which they found to be established there by the first conquerors. This is a much more natural way of accounting for the origin of a jury in Europe, than having recourse to the fabulous story of Woden and his savage Scythian companions, as the first introducers of to humane and beneficent an institution.

Trials by jury in civil causes are of two kinds; *extraordinary* and *ordinary*.

2. The first species of extraordinary trial by jury is that of the grand assize, which was instituted by King Henry II. in parliament, by way of alternative offered to the choice of the tenant or defendant in a writ of right, instead of the barbarous and unchristian custom of duelling. For this purpose a writ *de magna assisa eligenda* is directed to the sheriff, to return four knights, who are to elect and choose twelve others to be joined with them; and these all together form the grand assize, or great jury, which is to try the matter of right, and must now consist of sixteen jurors. Another species of extraordinary juries is the jury to try an attain: which is a process commenced against a former jury for bringing a false verdict. See the article *ATTAIN*.

2. With regard to the ordinary trial by jury in civil cases, the most clear and perspicuous way of treating it will be by following the order and course of the proceedings themselves.

When therefore an issue is joined by these words, "And this the said A prays may be inquired of by the country;" or, "And of this he puts himself upon the country, and the said B, does the like," the court awards a writ of *venire facias* upon the roll or record, commanding the sheriff "that he cause to come here, on such a day, twelve free and lawful men, *liberes et legales homines*, of the body of his county, by whom the truth of the matter may be better known, and who are neither of kin to the aforesaid A nor the aforesaid B, to recognize the truth of the issue between the said parties." And such writ is accordingly issued to the sheriff. It is made returnable on the last return of the same term wherein issue is joined, *viz.* hilly or trinity terms; which, from the making up of the issues therein, are usually called *issuable terms*. And he returns the names of the jurors in a panel (a little pane or oblong piece of parchment) annexed to the writ. This jury is not summoned, and therefore not appearing at the day must unavoidably make default. For which reason a compulsive process is now awarded against the jurors, called in the common pleas a writ of *habere corpus juratorum*, and in the King's Bench *disfranchis*, commanding the sheriff to have their bodies, or to distrain them by their lands and goods, that they may appear upon the day appointed. The entry therefore on the roll of record is, "that the jury is respited, through defect of the jurors, till the first day of the next term, then to appear at Westminster; unless before that time, *viz.* on Wednesday the fourth of March, the justices of our lord the king appointed to take assizes in that county shall have come to Oxford, that is, to the place assigned for holding the assizes. Therefore the sheriff is commanded to have their bodies at Westminster on the said first day of next term, or before the said justices of assize, if before that time they come to Oxford, *viz.* on the fourth of March aforesaid." And as the judges are sure to come and open the circuit-commissions

on the day mentioned in the writ, the sheriff returns and summons this jury to appear at the assizes; and there the trial is had before the justices of assize and *nisi prius*: among whom (as hath been said under the article *Assize*) are usually two of the judges of the courts at Westminster, the whole kingdom being divided into six circuits for this purpose. And thus we may observe, that the trial of common assizes, at *nisi prius*, was in its original only a collateral incident to the original business of the justices of assize; though now, by the various revolutions of practice, it is become their principal civil employment; hardly any thing remaining in use of the real assizes but the name.

If the sheriff be not an indifferent person, as if he be a party in the suit, or be related by either blood or affinity to either of the parties, he is not then trusted to return the jury; but the *venue* shall be directed to the coroners, who in this, as in many other instances, are the substitutes of the sheriff to execute process when he is deemed an improper person. If any exception lies to the coroners, the *venue* shall be directed to two clerks of the court, or two persons of the county named by the court, and sworn. And these two, who are called *clerks*, or electors, shall indifferently name the jury, and their return is final; no challenge being allowed to their array.

Let us now pause a while, and observe (with Sir Matthew Hale, Hist. C. L. c. 12), in these first preparatory stages of the trial, how admirably this constitution is adapted and framed for the investigation of truth beyond any other method of trial in the world. For, first, the person returning the jurors is a man of some fortune and consequence; that so he may be not only the less tempted to commit wilful errors, but likewise be responsible for the faults of either himself or his officers: and he is also bound by the obligation of an oath faithfully to execute his duty. Next, as to the time of their return: the panel is returned to the court upon the original *venue*, and the jurors are to be summoned and brought in many weeks afterwards to the trial, whereby the parties may have notice of the jurors, and of their sufficiency or insufficiency, characters, connections, and relations, that so they may be challenged upon just cause; while, at the same time, by means of the compulsory process (of *disfringas*, or *habere corpora*) the cause is not like to be retarded through defect of jurors. Thirdly, as to the place of their appearance: which in causes of weight and consequence is at the bar of the court; but in ordinary cases at the assizes, held in the county where the cause of action arises, and the witnesses and jurors live: a provision most excellently calculated for the saving of expence to the parties. For though the preparation of the causes in point of pleading is transacted at Westminster, whereby the order and uniformity of proceeding is preserved throughout the kingdom, and multiplicity of forms is prevented; yet this is no great charge or trouble, one attorney being able to transact the business of forty clients. But the troublesome and most expensive attendance is that of jurors and witnesses at the trial; which therefore is brought home to them, in the county where most of them inhabit. Fourthly, the persons before whom they are to appear, and before whom the trial is to be held, are the judges of the superior court, if it be a trial at bar; or the judges of assize, delegated from the courts at Westminster by the king, if the trial be held in the country: persons, whose learning and dignity secure their jurisdiction from contempt, and the novelty and very parade of whose appearance have no small influence upon the multitude. The very point of their being strangers in the county is of infinite service, in preventing those factions and parties which would intrude in every cause of moment, were it tried only before persons resident on the spot, as justices of the

peace, and the like. And the better to remove all suspicion of partiality, it was wisely provided by the statutes 4 Edw. III. c. 2. 8 Ric. II. c. 2. and 33 Hen. VIII. c. 24. that no judge of assize should hold pleas in any county wherein he was born or inhabits. And as this constitution prevents party and faction from intermingling in the trial of right, so it keeps both the rule and the administration of the laws uniform. These justices, though thus varied and shifted at every assize, are all sworn to the same laws, have had the same education, have pursued the same studies, converse and consult together, communicate their decisions and resolutions, and preside in those courts which are mutually connected, and their judgments blended together, as they are interchangeably courts of appeal or advice to each other. And hence their administration of justice, and conduct of trials, are consonant and uniform; whereby that confusion and contrariety are avoided, which would naturally arise from a variety of uncommunicating judges, or from any provincial establishment. But let us now return to the assizes.

When the general day of trial is fixed, the plaintiff or his attorney must bring down the record to the assizes, and enter it with the proper officer, in order to its being called on in court.

These steps being taken, and the cause called on in court, the record is then handed to the judge, to peruse and observe the pleadings, and what issues the parties are to maintain and prove, while the jury is called and sworn. To this end the sheriff returns his compulsory process, the writ of *habeas corpora*, or *disfringas*, with the panel of jurors annexed, to the judge's officer in court.

The jurors contained in the panel are either special or common jurors. Special juries were originally introduced in trials at bar, when the causes were of too great nicety for the discussion of ordinary freeholders; or where the sheriff was suspected of partiality, though not upon such apparent cause as to warrant an exception to him. He is in such cases, upon motion in court, and a rule granted thereupon, to attend the prothonotary or other proper officer with his freeholder's book; and the officer is to take indifferently forty-eight of the principal freeholders, in the presence of the attorneys on both sides: who are each of them to strike off twelve, and the remaining twenty-four are returned upon the panel. By the statute 3 Geo. II. c. 25. either party is entitled upon motion to have a special jury struck upon the trial of any issue, as well at the assizes as at bar, he paying the extraordinary expence, unless the judge will certify (in pursuance of the statute 24 Geo. II. c. 18.) that the cause required such special jury.

A common jury is one returned by the sheriff according to the directions of the statute 3 Geo. II. c. 25. which appoints, that the sheriff or officer shall not return a separate panel for every separate cause, as formerly; but one and the same panel for every cause to be tried at the same assizes, containing not less than forty-eight, nor more than seventy-two, jurors: and that their names being written on tickets, shall be put into a box of glass; and when each cause is called, twelve of these persons, whose names shall be first drawn out of the box, shall be sworn upon the jury, unless absent, challenged, or excused; or unless a previous view of the messuages, lands, or place in question, shall have been thought necessary by the court; in which case, six or more of the jurors returned, to be agreed on by the parties, or named by a judge or other proper officer of the court, shall be appointed by special writ of *habeas corpora* or *disfringas*, to have the matters in question shown to them by two persons named in the writ; and then such of the jury as have had the view, or so many of them as appear, shall be sworn on the inquest previous to any other jurors. These

acts are well calculated to restrain any suspicion of partiality in the sheriff, or any tampering with the jurors when returned.

As the jurors appear when called, they shall be sworn, unless challenged by either party. See the article CHALLENGE.

If by means of challenges or other cause, a sufficient number of unexceptionable jurors doth not appear at the trial, either party may pray a *tales*.

A *tales* is a supply of such men as are summoned upon the first panel, in order to make up the deficiency. For this purpose a writ of *decem tales, octo tales*, and the like, was wont to be issued to the sheriff at common law, and must be still so done at a trial at bar, if the jurors make default. But at the assizes, or *nisi prius*, by virtue of the statute 35 Hen. VIII. c. 6. and other subsequent statutes, the judge is empowered at the prayer of either party to award a *tales de circumstantibus* of persons present in court, to be joined to the other jurors to try the cause; who are liable, however, to the same challenges as the principal jurors. This is usually done till the legal number of twelve be completed; in which patriarchal and apostolical manner Sir Edward Coke hath discovered abundance of mystery.

When a sufficient number of persons impanelled, or talesmen appear, they are then separately sworn, well and truly to try the issue between the parties, and a true verdict to give according to the evidence; and hence they are denominated "the jury," *jurata*, and "jurors," *sc. juratores*.

The jury are now ready to hear the merits; and to fix their attention the closer to the facts which they are impanelled and sworn to try, the pleadings are opened to them by counsel on that side which holds the affirmative of the question in issue. For the issue is said to lie, and proof is always first required upon that side which affirms the matter in question: in which our law agrees with the civil, *ei incumbit probatio qui dicit, non qui negat; cum per rerum naturam factum negantis probatio nulla sit*. The opening counsel briefly informs them what has been transacted in the court above; the parties, the nature of the action, the declaration, the plea, replication, and other proceedings; and lastly, upon what point the issue is joined, which is there sent down to be determined. Instead of which, formerly the whole record and process of the pleadings were read to them in English by the court, and the matter of issue clearly explained to their capacities. The nature of the case, and the evidence intended to be produced, are next laid before them by counsel also on the same side; and when the evidence is gone through, the advocate on the other side opens the adverse case, and supports it by evidence; and then the party which began is heard by way of reply. See PLEADINGS.

Evidence in the trial by jury is of two kinds; either that which is given in proof, or that which the jury may receive by their own private knowledge. The former, or *proofs* (to which in common speech the name of evidence is usually confined), are either written or parol, that is, by word of mouth. Written proofs, or evidence, are, 1. Records; and 2. Ancient deeds of thirty years' standing, which prove themselves; but, 3. Modern deeds; and, 4. Other writings, must be attested and verified by parol evidence of witnesses. With regard to parol evidence or witnesses; it must first be remembered, that there is a process to bring them in by writ of *habeas ad testificandum*; which commands them, laying aside all pretences and excuses, to appear at the trial on pain of 100 l. to be forfeited to the king; to which the statute 5 Eliz. c. 9. has added a penalty of 10 l. to the party aggrieved, and damages equivalent to the loss sustained by want of his evidence. But no witness, unless his reasonable expences be tendered him, is

bound to appear at all; nor, if he appears, is he bound to give evidence till such charges are actually paid him; except he resides within the bills of mortality, and is summoned to give evidence within the fame. This compulsory process, to bring in unwilling witnesses, and the additional terrors of an attachment in case of disobedience, are of excellent use in the thorough investigation of truth: and, upon the same principle, in the Athenian courts, the witnesses who were summoned to attend the trial had their choice of three things: either to swear to the truth of the fact in question, to deny or abjure it, or else to pay a fine of 1000 drachmas.

All witnesses, of whatever religion or country, that have the use of their reason, are to be received and examined, except such as are infamous, or such as are interested in the event of the cause. All others are competent witnesses; though the jury from other circumstances will judge of their credibility. Infamous persons are such as may be challenged as jurors, *propter delictum*: and therefore never shall be admitted to give evidence to inform that jury, with whom they were too scandalous to associate. Interested witnesses may be examined upon a *voir dire*, if suspected to be secretly concerned in the event; or their interest may be proved in court. Which last is the only method of supporting an objection to the former class; for no man is to be examined to prove his own infamy. And no counsel, attorney, or other person, intrusted with the secrets of the cause by the party himself, shall be compelled, or perhaps allowed, to give evidence of such conversation or matters of privacy as came to his knowledge by virtue of such trust and confidence: but he may be examined as to mere matters of fact, as the execution of a deed or the like, which might have come to his knowledge without being intrusted in the cause.

One witness (if credible) is sufficient evidence to a jury of any single fact: though undoubtedly the concurrence of two or more corroborates the proof. Yet our law considers that there are many transactions to which only one person is privy; and therefore does not always demand the testimony of two. Positive proof is always required, where, from the nature of the case, it appears it might possibly have been had. But, next to positive proof, circumstantial evidence, or the doctrine of presumptions, must take place: for when the fact itself cannot be demonstratively evinced, that which comes nearest to the proof of the fact is the proof of such circumstances which either necessarily or usually attend such facts; and these are called *presumptions*, which are only to be relied upon till the contrary be actually proved.

The oath administered to the witness is not only that what he deposes shall be true, but that he shall also depose the whole truth: so that he is not to conceal any part of what he knows, whether interrogated particularly to that point or not. And all this evidence is to be given in open court, in the presence of the parties, their attorneys, the counsel, and all bystanders; and before the judge and jury: each party having liberty to except to its competency, which exceptions are publicly stated, and by the judge are openly and publicly allowed or disallowed, in the face of the country: which must curb any secret bias or partiality that might arise in his own breast.

When the evidence is gone through on both sides, the judge, in the presence of the parties, the counsel, and all others, sums up the whole to the jury; omitting all superfluous circumstances, observing wherein the main question and principal issue lies, stating what evidence has been given to support it, with such remarks as he thinks necessary for their direction, and giving them his opinion in matters of law arising upon that evidence.

The jury, after the proofs are summed up, unless the case

be very clear; withdraw from the bar to consider of their verdict; and in order to avoid intemperance and causeless delay, are to be kept without meat, drink, fire, or candle, unless by permission of the judge, till they are unanimously agreed. A method of accelerating unanimity not wholly unknown in other constitutions of Europe, and in matters of greater concern. For by the golden bull of the empire, if, after the congress is opened, the electors delay the election of a king of the Romans for thirty days, they shall be fed only with bread and water till the fame is accomplished. But if our juries eat or drink at all, or have any eatables about them, without consent of the court, and before verdict, it is fineable; and if they do so at his charge for whom they afterwards find, it will set aside the verdict. Also, if they speak with either of the parties or their agents after they are gone from the bar, or if they receive any fresh evidence in private, or if, to prevent disputes, they cast lots for whom they shall find, any of these circumstances will entirely vitiate the verdict. And it has been held, that if the jurors do not agree in their verdict before the judges are about to leave the town, though they are not to be threatened or imprisoned, the judges are not bound to wait for them, but may carry them round the circuit from town to town in a cart. This necessity of a total unanimity seems to be peculiar to our own constitution; or at least, in the *nemda* or jury of the ancient Goths, there was required (even in criminal cases) only the consent of the major part; and in case of an equality, the defendant was held to be acquitted.

When they are all unanimously agreed, the jury return back to the bar; and before they deliver their verdict, the plaintiff is bound to appear in court, by himself, attorney, or counsel, in order to answer the amercement to which by the old law he is liable, in case he fails in his suit, as a punishment for his false claim. To be amerced, or a *mercie*, is to be at the king's mercy with regard to the fine to be imposed; *in misericordia domini regis pro falso clamore suo*. The amercement is dispensed, but the form still continues; and if the plaintiff does not appear, no verdict can be given; but the plaintiff is said to be nonsuit, *non sequitur clamorem suum*. Therefore it is usual for a plaintiff, when he or his counsel perceives that he has not given evidence sufficient to maintain his issue, to be voluntarily nonsuited, or withdraw himself: whereupon the crier is ordered to call the plaintiff; and if neither he, nor any body for him, appears, he is nonsuited, the jurors are discharged, the action is at an end, and the defendant shall recover his costs. The reason of this practice is, that a nonsuit is more eligible for the plaintiff than a verdict against him: for after a nonsuit, which is only a default, he may commence the same suit again for the same cause of action; but after a verdict had, and judgment consequent thereupon, he is for ever barred from attacking the defendant upon the same ground of complaint. But in case the plaintiff appears, the jury by their foreman deliver in their verdict.

A verdict, *vere dictum*, is either privy or public. A privy verdict is when the judge hath left or adjourned the court: and the jury, being agreed, in order to be delivered from their confinement, obtain leave to give their verdict privily to the judge out of court: which privy verdict is of no force, unless afterwards affirmed by a public verdict given openly in court; wherein the jury may, if they please, vary from their privy verdict. So that the privy verdict is indeed a mere nullity; and yet it is a dangerous practice, allowing time for the parties to tamper with the jury, and therefore very seldom indulged. But the only effectual and legal verdict is the public verdict: in which they openly declare to have found the issue for the plaintiff, or for the defendant; and if for the plaintiff, they assess the damages also sustained by the plaintiff,

in consequence of the injury upon which the action is brought.

When the jury have delivered in their verdict, and it is recorded in court, they are then discharged; and so ends the trial by jury: a trial which ever has been, and it is hoped ever will be, looked upon as the glory of the English law. It is certainly the most transcendent privilege which any subject can enjoy or wish for, that he cannot be affected either in his property, his liberty, or his person, but by the unanimous consent of twelve of his neighbours and equals. A constitution that we may venture to affirm has, under Providence, secured the just liberties of this nation for a long succession of ages. And therefore a celebrated French writer, who concludes, that because Rome, Sparta, and Carthage, have lost their liberties, therefore those of England in time must perish, should have recollected, that Rome, Sparta, and Carthage, at the time when their liberties were lost, were strangers to the trial by jury.

Great as this eulogium may seem, it is no more than this admirable constitution, when traced to its principles, will be found in sober reason to deserve.

The impartial administration of justice, which secures both our persons and our properties, is the great end of civil society. But if that be entirely entrusted to the magistracy, a select body of men, and those generally selected by the prince or such as enjoy the highest offices in the state, their decisions, in spite of their own natural integrity, will have frequently an involuntary bias towards those of their own rank and dignity: it is not to be expected from human nature, that the few should be always attentive to the interests and good of the many. On the other hand, if the power of judicature were placed at random in the hands of the multitude, their decisions would be wild and capricious, and a new rule of action would be every day established in our courts. It is wisely therefore ordered, that the principles and axioms of law, which are general propositions flowing from abstracted reason, and not accommodated to times or to men, should be deposited in the breasts of the judges, to be occasionally applied to such facts as come properly ascertained before them. For here partiality can have little scope; the law is well known, and is the same for all ranks and degrees: it follows as a regular conclusion from the premises of fact pre-established. But in settling and adjusting a question of fact, when intrusted to any single magistrate, partiality and injustice have an ample field to range in, either by boldly asserting that to be proved which is not so, or more artfully by suppressing some circumstances, stretching and warping others, and distinguishing away the remainder. Here therefore a competent number of sensible and upright jurymen, chosen by lot from among those of the middle rank, will be found the best investigators of truth, and the surest guardians of public justice. For the most powerful individual in the state will be cautious of committing any flagrant invasion of another's right, when he knows that the fact of his oppression must be examined and decided by twelve indifferent men not appointed till the hour of trial; and that when once the fact is ascertained, the law must of course redress it. This therefore preserves in the hands of the people that share which they ought to have in the administration of public justice, and prevents the encroachments of the more powerful and wealthy citizens.

Criminal Trials. The regular and ordinary method of proceeding in the courts of criminal jurisdiction may be distributed under twelve general heads, following each other in a progressive order: *viz.* 1. Arrest; 2. Commitment and bail; 3. Prosecution; 4. Process; 5. Arraignment, and its incidents; 6. Plea, and issue; 7. Trial, and conviction; 8. Clergy; 9. Judgment, and its consequences; 10. Reversal of Judgment.

ment; 11. Reprieve, or pardon; 12. Execution. See ARREST, COMMITMENT, PRESENTMENT, INDICTMENT, INFORMATION, APPEAL, PROCESS *upon an Indictment*, ARRAIGNMENT, and PLEA; in which articles all the forms which precede the trial are described, and are here enumerated in the proper order.

The several methods of trial and conviction of offenders, established by the laws of England, were formerly more numerous than at present, through the superstition of our Saxon ancestors; who, like other northern nations, were extremely addicted to divination; a character which Tacitus observes of the ancient Germans. They therefore invented a considerable number of methods of purgation or trial, to preserve innocence from the danger of false witnesses, and in consequence of a notion that God would always interpose miraculously to vindicate the guilty; as, 1. By ORDEAL; 2. By CORSED; 3. By BATTEL. See those articles.

4. A fourth method is that by the *peers of Great Britain*, in the Court of PARLIAMENT; or the Court of the Lord High STeward, when a peer is capitally indicted; for in case of an appeal, a peer shall be tried by jury. This differs little from the trial *per patriam*, or by jury; except that the peers need not all agree in their verdict; and except also, that no special verdict can be given in the trial of a peer; because the lords of parliament, or the lord high steward (if the trial be had in his court), are judges sufficiently competent of the law that may arise from the fact; but the greater number, consisting of twelve at the least, will conclude and bind the minority.

The trial by jury, or the country, *per patriam*, is also that trial by the peers of every Briton, which, as the great bulwark of his liberties, is secured to him by the great charter: *nullus liber homo capitur, vel imprisonetur, aut exulet, aut aliquo alio modo deſtratur, niſi per legale iudicium patriæ ſuorum, vel per legem terre*.

When therefore a prisoner on his ARRAIGNMENT has pleaded not guilty, and for his trial hath put himself upon the country, which country the jury are, the sheriff of the county must return a panel of jurors, *liberos et legales homines, de vicineto*; that is, freeholders without just exception; and of the *viſne* or neighbourhood; which is interpreted to be of the county where the fact is committed. If the proceedings are before the court of king's bench, there is time allowed between the arraignment and the trial, for a jury to be impanelled by writ of *venire facias* to the sheriff, as in civil causes; and the trial in case of a misdemeanor is had at *niſi prius*, unless it be of such consequence as to merit a trial at bar; which is always invariably had when the prisoner is tried for any capital offence. But, before commissioners of oyer and terminer and gaol-delivery, the sheriff, by virtue of a general precept directed to him beforehand, returns to the court a panel of forty-eight jurors, to try all felons that may be called upon their trial at that session; and therefore it is there usual to try all felons immediately or soon after their arraignment. But it is not customary, nor agreeable to the general course of proceedings, unless by consent of parties, to try persons indicted of smaller misdemeanors at the same court in which they have pleaded not guilty, or traversed the indictment. But they usually give security to the court to appear at the next assizes or session, and then and there to try the traverser, giving notice to the prosecutor of the same.

In cases of high-treason, whereby corruption of blood may ensue (except treason in counterfeiting the king's coin or seals), or imprisonment of such treason, it is enacted by statute 7 W. III. c. 3. first, that no person shall be tried for any such treason, except an attempt to assassinate the king, unless the indictment be found within three years after the offence committed; next, that the prisoner shall have a copy of the in-

dictment (which includes the caption), but not the names of the witnesses, five days at least before the trial, that is, upon the true construction of the act, before his arraignment; for then is his time to take any exceptions thereto, by way of plea or demurrer; thirdly, that he shall also have a copy of the panel of jurors two days before his trial; and, lastly, that he shall have the same compulsive process to bring in his witnesses for him, as was usual to compel their appearance against him. And by statute 7 Ann. c. 21. (which did not take place till after the decease of the late Pretender) all persons indicted for high-treason, or misprisions thereof, shall have not only a copy of the indictment, but a list of all the witnesses to be produced, and of the jurors impanelled, with their professions and places of abode, delivered to him ten days before the trial, and in the presence of two witnesses, the better to prepare him to make his challenges and defence. And no person indicted for felony is, or (as the law stands) ever can be, entitled to such copies before the time of his trial.

When the trial is called on, the jurors are to be sworn as they appear, to the number of twelve, unless they are challenged by the party.

Challenges may here be made, either on the part of the king, or on that of the prisoner; and either to the whole array, or to the separate polls, for the very same reasons that they may be made in civil causes. But in criminal cases, or at least in capital ones, there is, *in favorem vite*, allowed to the prisoner an arbitrary and capricious species of challenge, to a certain number of jurors, without showing any cause at all; which is called a *peremptory challenge*; a provision full of that tenderness and humanity to prisoners for which our English laws are justly famous. This is grounded on two reasons. 1. As every one must be sensible what sudden impressions and unaccountable prejudices we are apt to conceive upon the bare looks and gestures of another; and how necessary it is that a prisoner (when put to defend his life) should have a good opinion of his jury, the want of which might totally disconcert him; the law wills not that he should be tried by any one man against whom he has conceived a prejudice, even without being able to assign a reason for such his dislike. 2. Because, upon challenges for cause shown, if the reason assigned prove insufficient to set aside the juror, perhaps the bare questioning his indifference may sometimes provoke a resentment; to prevent all ill consequences from which, the prisoner is still at liberty, if he pleases, peremptorily to set him aside.

The peremptory challenges of the prisoner must, however, have some reasonable boundary; otherwise he might never be tried. This reasonable boundary is settled by the common law to be the number of thirty-five; that is, one under the number of three full juries.

If by reason of challenges or the default of the jurors, a sufficient number cannot be had of the original panel, a tales may be awarded as in civil causes, till the number of twelve is sworn, "well and truly to try, and true deliverance make, between our sovereign lord the king and the prisoner whom they have in charge; and a true verdict to give, according to their evidence."

When the jury is sworn, if it be a cause of any consequence, the INDICTMENT is usually opened, and the evidence marshalled, examined, and enforced by the counsel for the crown or prosecution. But it is a settled rule at common law, that no counsel shall be allowed a prisoner upon his trial upon the general issue, in any capital crime, unless some point of law shall arise proper to be debated. A rule which (however it may be palliated under cover of that noble declaration of the law, when rightly understood, that the judge shall be counsel for the prisoner; that is, shall see that the proceedings against him are legal and strictly regular) seems to be not at

all of a piece with the rest of the humane treatment of prisoners by the English law. For upon what face of reason can that assistance be denied to save the life of a man, which yet is allowed him in prosecutions for every petty trespass? Nor indeed is it, strictly speaking, a part of our ancient law; for the *Mirror*, having observed the necessity of counsel in civil suits, "who know how to forward and defend the cause by the rules of law, and customs of the realm," immediately afterwards subjoins, "and more necessary are they for defence upon indictments and appeals of felony, than upon other venial causes." And, to say the truth, the judges themselves are so sensible of this defect in our modern practice, that they seldom scruple to allow a prisoner counsel to stand by him at the bar, and to instruct him what questions to ask, or even to ask questions for him, with regard to matters of fact; for as to matters of law arising on the trial, they are entitled to the assistance of counsel. But still this is a matter of too much importance to be left to the good pleasure of any judge, and is worthy the interposition of the legislature; which has shown its inclination to indulge prisoners with this reasonable assistance, by enacting, in statute 7 W. III. c. 3. that persons indicted for such high-treason as works a corruption of the blood or misprison thereof (except treason in counterfeiting the king's coins or seals), may make their full defence by counsel, not exceeding two, to be named by the prisoner, and assigned by the court or judge; and this indulgence, by statute 20 Geo. II. c. 30. is extended to parliamentary impeachments for high-treason, which were excepted in the former act.

When the evidence on both sides is closed, the jury cannot be discharged (unless in cases of evident necessity) till they have given in their *VERDICT*. If they find the prisoner not guilty, he is then for ever quit and discharged of the accusation, except he be appealed of felony within the time limited by law. And upon such his acquittal, or discharge for want of prosecution, he shall be immediately set at large without payment of any fee to the goaler. But if the jury find him guilty, he is then said to be convicted of the crime whereof he stands indicted. See the article *CONVICTION*; and, subsequent thereto, the articles *JUDGMENT*, *ATTAINDER*, *FORFEITURE*, *EXECUTION*; also *Benefit of CLERGY*, *REPRISAL*, *PARDON*.

TRIANDRIA (from *tres* "three," and *andros* "a man or husband"), the name of the third class in Linnæus's sexual system, consisting of plants with hermaphrodite flowers, which have three stamens or male organs.

TRIANGLE, in geometry, a figure of three sides and three angles.

TRIBE, in antiquity, a certain quantity or number of persons, when a division was made of a city or people into quarters or districts.

TRIBRACHYS, in ancient poetry, a foot consisting of three syllables, and these all short; as, *melibius*.

TRIBUNAL, in general, denotes the seat of a judge, called in our courts *bench*.

TRIBUNUS, among the ancient Romans, a magistrate chosen out of the commons, to protect them against the oppressions of the great, and to defend the liberty of the people against the attempts of the senate and consuls. The tribunes of the people were first established in the year of Rome 259. The first design of their creation was to shelter the people from the cruelty of usurers, and to engage them to quit the Aventine mount, whither they had retired in displeasure. Their number at first was but two; but the next year, under the consulship of A. Posthumus Aruncius, and C. Cassius Viscellinus, there were three more added; and this number of five was afterwards increased by L. Trebonius to ten.

Military TRIBUNE, an officer in the Roman army, commander in chief over a body of forces, particularly the division of a legion; much the same with our colonel, or the French *maître de camp*.

TRIBUTARY, one who pays tribute to another, in order to live in peace with him or share in his protection.

TRIBUTE, a tax or impost which one prince or state is obliged to pay to another as a token of dependence, or in virtue of a treaty, and as a purchase of peace.

TRICES, in anatomy. See *ANATOMY*, *Table of the MUSCLES*.

TRICHECUS, **WALRUS**, a genus of aquatic animals belonging to the class of *mammalia*, and order of *bruta*. This genus has no fore-teeth, when full grown: has two great tusks in the upper jaw, which point downwards: has grinders on each side in both jaws, which are composed of furrowed bones. The body is oblong; the lips are doubled; and the hind legs are stretched backwards, and, as it were, bound together, forming a kind of tail fitted for swimming. There are three species; the *rosmarus*, *dugon*, and *manatus*.

1. The *rosmarus*, morse, or sea-horse, has a round head; small mouth; very thick lips, covered above and below with pellucid bristles as thick as a straw; small fiery eyes; two small orifices instead of ears; short neck; body thick in the middle, tapering towards the tail; skin thick, wrinkled, with short brownish hairs thinly dispersed; legs short, five toes on each, all connected by webs, and small nails on each: the hind feet are very broad; each leg loosely articulated; the hind legs generally extended on a line with the body: the tail is very short; penis long: length of the animal from nose to tail sometimes 18 feet, and 10 or 12 round in the thickest part: the teeth have been sometimes found of the weight of 30lb. each. Teeth of this size are only found on the coast of the Icy Sea, where the animals are seldom molested, and have time to attain their full growth. See *Plate 2*.

They inhabit the coast of Spitzbergen, Nova Zembla, Hudson's Bay, and the gulph of St. Lawrence; and the Icy Sea, as far as Cape Tchuktschi. They are gregarious; in some places appearing in herds of hundreds. They are shy animals, and avoid places which are much haunted by mankind; but are very fierce. If wounded in the water, they attempt to sink the boat, either by rising under it, or by striking their great teeth into the sides; they roar very loud, and will follow the boat till it gets out of sight. Numbers of them are often seen sleeping on an island of ice; if awaked, they fling themselves with great impetuosity into the sea; at which time it is dangerous to approach the ice, lest they should tumble into the boat and overset it. They do not go upon land till the coast is clear of ice. At particular times they land in amazing numbers: the moment the first gets on shore, so as to lie dry, it will not stir till another comes and forces it forward by beating it with its great teeth; this is served in the same manner by the next; and so in succession till the whole is landed; continuing tumbling over one another, and forcing the foremost, for the sake of quiet, to remove farther up.

They are killed for the sake of their oil, one walrus producing about half a tun. The knowledge of this chase is of great antiquity; Other the Norwegian, about the year 890, made a report of it to King Alfred, having, as he says, made the voyage beyond Norway, for the more commodious of *fish*ing of *horse-whales*, which have in their teeth bones of great price and excellency, whereof he brought some at his return into the king. In fact, it was in the northern world, in early times, the substitute to ivory, being very white and very hard. Their skins, Other says, were good to cut into cables. M. de Buffon says, he has seen braces for coaches made of the skin, which were both strong and elastic.

They bring one, or at most two, young at a time: they feed on sea herbs and fish; also on shells, which they dig out of the sand with their teeth: they are said also to make use of their teeth to ascend rocks or pieces of ice, fastening them to the cracks; and drawing their bodies up by that means. Besides mankind, they seem to have no other enemy than the white bear, with whom they have terrible combats; but generally come off victorious, by means of their great teeth.

In Captain Cook's Voyages we have the following affecting account of their parental attachment to their young. "On the approach of the boats towards the ice, they took their young ones under their fins, and attempted to escape with them into the sea. Some, whose cubs were killed or wounded, and left floating upon the surface of the water, rose again, and carried them down, sometimes just as our men were on the point of taking them into the boat; and could be traced bearing them to a considerable distance through the water, which was stained with their blood. They were afterwards observed bringing them, at intervals, above the surface, as if for air, and again plunging under it, with a horrid bellowing. The female, in particular, whose young one had been killed, and taken into the boat, became so furious, that she even struck her two tusks through the bottom of the cutter."

2. The *dugon*, or Indian walrus, is distinguished by the tusks which extend out of the mouth from the upper jaw being placed near each other. It inhabits the seas lying between the Cape of Good Hope and the Philippine islands. This animal, so far as can be known, resembles the morse very much; the head is, however, more lengthened and narrower; the nostrils are large, and placed higher; like the former species, there are no tusks in the under jaw, but those in the upper jaw, as has been already observed, are placed near each other, bent outwards, and resemble cutting teeth, only that they are near six inches long; there are four grinders on each side in the upper jaw, and three in the lower; these last are distant from the tusks, and are broader than those of the morse: the female has two teats on the breast: the chin has a bristly beard; the ears are short; the feet broad; and the legs so short that the belly trails on the ground. When full grown, the animal is six ells in length; the male being rather larger than the female, which has breasts like a woman: it feeds on a green sea moss or weed, which grows near the shore. The figure, manners, and history, of this animal, are very imperfectly known; but we are informed that its flesh eats like beef.

3. *Manatus*, fish-tailed walrus, or sea-cow, has no tusks, and no hind feet. Of this species there are two varieties; the australis, or lamantin, and the borealis or whale-tailed manati. The lamantin inhabits the African and American seas, particularly near the mouths of rivers, which they frequently enter, seldom going far from the shore. The lamantin varies in size from eight to seventeen feet long, is six or seven in circumference, and from 500 to 800 pounds weight: the skin is of a dark or black ash colour; there are nine square-shaped grinders on each side in each jaw, which are covered with a glassy crust of enamel; the back bone has 50 joints or vertebrae: it is a thick clumsy animal, having no properly distinct neck, as the body continues almost of an equal thickness to the head. The female has two teats placed near the arm-pits. This animal never comes on shore, but frequents the mouths of large rivers, browsing on the grass which grows close to the water. There seems to be two varieties, differing considerably in size. The larger frequents the seas near the mouths of large rivers; and the smaller is found higher up the same rivers, and in inland fresh water lakes, but never goes to the sea.

We are told that this animal is often tamed by the native inhabitants of America, and that it delights in music; hence,

according to some authors, it is probably the delphinus or dolphin of the ancients: and some believe, that what has been written concerning mermaids and sirens must be referred to this animal. It has a voracious appetite, and is perpetually eating: it is monogamous, or lives in families of one male, one female, a half grown and a very small young one; copulates in the spring, the female at first flying in various playful circles, and then throwing herself on her back to receive the male: when pasturing on the aquatic plants, the back is often above water: and, as the skin is full of a species of louse, numbers of sea fowls perch on them, to pick out the insects. They bellow like bulls: their sight is very weak, but their hearing extremely acute; the fore-feet are palmated and fin-shaped, almost like those of a sea-turtle; and instead of hind-feet they have a horizontal tail; they have no external ears; the nostrils are distinct, and at a distance from each other; the females have two teats about the breast; the upper lip is full of sharp, prickly, rigid bristles. This animal has great affinity to the whale and seal tribes. The flesh is very good eating.

The whale-tailed manati inhabits the north-west coast of America, the north-east of Asia, and the islands which lie between these two coasts. This animal very often enters the mouths of the rivers; is sometimes 23 feet long, and weighs 8000 pounds; the skin, while wet, is of a brown colour, but becomes black when dry. Instead of grinders, this species has, on each side of each jaw, a large rugged bone. The backbone has 65 vertebrae or joints: the body is very clumsy, and much deformed; its circumference at the shoulders is 12 feet, at the belly 20, and near the tail only four; the neck is near seven feet round, and the head only 3 1/2 inches.

They live perpetually in the water, and frequent the edges of the shores; and in calm weather swim in groves near the mouths of rivers: in the time of flood they come so near the land, that a person may stroke them with his hand: if hurt, they swim out to sea; but presently return again. The females oblige the young to swim before them, while the other old ones furround, and as it were guard them on all sides. The affection between the male and female is very great: for if the is attacked, he will defend her to the utmost; and if she is killed, will follow her corpse to the very shore, and swim for some days near the place it has been landed at. They copulate in the spring, in the same manner as the human kind, especially in calm weather, towards the evening. The female swims gently about; the male pursues; till, tired with wantoning, she flings herself on her back, and admits his embraces. Steller thinks they go with young about a year; it is certain that they bring but one young one at a time, which they suckle by two teats placed between the breasts. They are vastly voracious and gluttonous; and feed not only on the fuci that grow in the sea, but such as are flung on the edges of the shore. When they are filled, they fall asleep on their backs. During their meals, they are so intent on their food, that any one may go among them and choose which he likes best. Peter Martyr gives an instance of one that lived in a lake of Hispaniola for 25 years, and was so tame as to come to the edge of the shore on being called; and would even perform the part of a ferry, and carry several people at a time on its back to the opposite shore.—Their back and their sides are generally above water.

They continue in the Kamtschatkan and American seas the whole year; but in winter are very lean, so that you may count their ribs. They are taken by harpoons fastened to a strong cord; and after they are struck, it requires the united force of 30 men to draw them on shore. Sometimes when they are transfixed, they will lay hold of the rocks with their paws, and stick so fast as to leave the skin behind before they

can be forced off. When a manati is struck, its companions swim to its assistance; some will attempt to overturn the boat by getting under it; others will press down the rope, in order to break it; and others will strike at the harpoons with their tails, with a view of getting it out, in which they often succeed. They have not any voice; but make a noise by hard breathing like the snorting of a horse.

The skin is very thick, black, and full of inequalities, like the bark of oak, and so hard as scarce to be cut with an axe, and has no hair on it: beneath the hair is a thick blubber, which tastes like oil of almonds. The flesh is coarser than beef, and will not soon putrify. The young ones taste like veal. The skin is used for shoes, and for covering the sides of boats.

TRICHOMANES, in botany a genus of plants belonging to the class of *cryptogamia*, and order of *filices*. The parts of fructification are solitary, and terminated by a style like a bristle, on the very edge of the leaf. There are thirteen species; of which two are natives of Britain, the *pidiferum* and *tunbrigense*. 1. *Pidiferum*, or cup-trichomanes, has sub-bipinnated leaves, the pinnæ being alternate, close-lobed, and linear. It is found among stones in wet grounds in England. 2. *Tunbrigense*, or Tunbridge trichomanes, has pinnated leaves, the pinnæ being oblong, dichotomous, decurrent, and dentated. It is found in the fissures of moist rocks in Wales, and in many rocky places in Scotland.

TRICOCCÆ (τέρις "three," and κόκκος "a grain"), the name of the 38th order in Linnaeus's Fragments of a Natural Method, consisting of plants with a single three-cornered capsule, having three cells, or internal divisions, each containing a single seed. See **BOTANY**.

TRICOSANTHES, in botany a genus of plants belonging to the class of *monacia*, and order of *syngenesia*; and in the natural system ranging under the 34th order, *Cucurbitaceæ*. There are four species; only one of which is cultivated in the British gardens, the *anguria* or snake-gourd, which is a native of China, an annual, and of the cucumber tribe.

TRIDENT, an attribute of Neptune, being a kind of sceptre which the painters and poets put into the hands of that god, in form of a spear or fork with three teeth; whence the word.

TRIENNIAL, an epithet applied chiefly to officers or employments which last for three years.

TRIENS, in antiquity, a copper money of the value of one third of an *as*, which on one side bore a Janus's head, and on the other a water rat.

TRIENTALIS, CHICKWEED WINTER-GREEN, in botany a genus of plants belonging to the class of *heptandria*, and order of *monogynia*; and in the natural system ranging under the 20th order, *Rotaceæ*. The calyx is heptaphyllous; the corolla is equal and plane, and is divided into seven segments; the berry is multilocular and dry. There is only one species, the *europæa*; which is indigenous, and the only genus of *heptandria* that is so. The stalk is single, five or six inches high, terminated with five, six, or seven, oval pointed leaves; from the centre of which arise on long footstalks commonly two white starry flowers, each generally consisting of seven oval and equal petals, succeeded by a globular dry berry, covered with a thin white rind, having one cell, and containing several angular seeds.

TRIERS, or **TRÈVES**. See **TARVES**.

TRIFOLIUM, **TRÉFOIL**, or **CLOVER**, in botany a genus of plants belonging to the class of *diadelphis*, and order of *decandria*; and in the natural system ranging under the 32d order, *Papilionaceæ*. The flowers are generally in round heads; the pod is scarcely longer than the calyx, univalve, not opening, deciduous. The leaves are three together. According

to Murray's edition of Linnaeus, there are 46 species; of which 17 are natives of Britain. We shall describe some of the most remarkable of these:

1. *Meliloti officinalis*, or *mellilot*, has naked racemous pods, dispermous, wrinkly, and acute, with an erect stalk. It grows in corn-fields and by the way-sides, but not common. The stalk is erect, firm, striated, branched, and two or three feet high: the leaves ternate, smooth, obtusely oval, and serrated: the flowers are small, yellow, pendulous, and grow in long close spikes at the tops of the branches: the pod is very short, turgid, transversely wrinkled, pendulous, and contains either one or two seeds. The plant has a very peculiar strong scent, and disagreeable, bitter, acrid taste; but such, however, as is not disagreeable to cattle. The flowers are sweet-scented. It has generally been esteemed emollient and digestive, and been used in fomentations and cataplasms, particularly in the plaster employed in dressing blisters; but is now laid aside, as its quality is found to be rather acrid and irritating than emollient or resolvent. It communicates a most loathsome flavour to wheat and other grain, so as to render it unfit for making bread. It grows in corn-fields.

2. *Trifolium repens*, white creeping trefoil, or Dutch clover, has a creeping stalk, its flower gathered into an umbellar head, and its pods tetrapermous. It is very common in fields and pastures. It is well known to be excellent fodder for cattle; and the leaves are a good rustic hygrometer, as they are always relaxed and flaccid in dry weather, but erect in moist or rainy.

3. *Trifolium pratense*, purple or red clover, is distinguished by dense spikes, unequal corollas, by bearded stipulas, ascending stalks, and by the calyx having four equal teeth. This is the botanical description of this species given by Mr. Afzelius, who, in a paper of the first volume of the Linnaean Transactions, has been at much pains to remove three species of the trifolium from the confusion in which they have been long involved; namely, the *pratense*, *medium*, and *alpestre*. The red clover is common in meadows and pastures, and is the species which is generally cultivated as food for cattle. It abounds in every part of Europe, in North America, and even in Siberia. It delights most in rich, moist, and sunny places; yet flourishes in dry, barren, and shady places. For an account of the mode of cultivating it, see **HUSBANDRY**.

4. *Alpestre*, long-leaved purple trefoil, or mountain clover, is thus characterized by Mr. Afzelius. The spikes are dense; the corollas somewhat equal; the stipulas are bristly and divergent; the leaflets lanceolated; the stalks stiff, straight, and very simple. It grows in dry, mountainous, woody places, in Hungary, Austria, and Bohemia, &c.; but is not said by Mr. Afzelius to be a native of Britain.

5. The *medium*, according to Mr. Afzelius, has also been confounded with the two species last mentioned; but it is to be distinguished from them by having loose spikes, corollas somewhat equal, stipulas subulate and connivent, and stalks flexuose and branched. It is found in dry elevated situations, especially among shrubs, or in woods where the soil is chalky or clay, in England, Scotland, Sweden, Denmark, &c.

For a botanical description of the other species of the trifolium, see Lightfoot's *Flora Scotica*, Berkenhout's Synopsis of the Natural History of Great Britain and Ireland, and Withering's Botanical Arrangements.

TRIGA, in antiquity, denotes a kind of car or chariot drawn by three horses; whence the name.

TRIGLA, in ichthyology, a genus of fishes belonging to the order of thoracici. The head is loricated with rough lines, and there are seven rays in the membranes of the gills. There are eleven species; of which the principal are the *gurnardus*,

or grey gurnard; the cuculus, or red gurnard; the lyra, or piper; and the hirundo, or sapphirine gurnard.

TRIGLOCHIN, in botany: a genus of plants belonging to the class of *hexandria*, and order of *trigynia*; and in the natural system ranging under the fifth order, *Tripelatoide*. The calyx is triphyllous; the petals are three; there is no style; the capsule opens at the base. There are three species; of which the *palustre* and *maritimum* are British. 1. *Palustre*, or arrow-headed grass, has an oblong trilocular capsule. The stalk is simple, eight or ten inches high; the leaves long and narrow; the flowers are greenish, and grow at the end of a long spike. It is frequent in moist ground. 2. *Maritimum*, or sea-spiked grass, has ovate hexlocular capsules; the stalk is short; the spike long, and flowers purplish. It is frequent on the sea-coasts. Linnæus says that cattle eat these two species with avidity.

TRIGLYPHS, in architecture, a sort of ornaments repeated at equal intervals, in the Doric freeze.

Dialing TRIGON. See **DIALING**.

TRIGONALIS. See **EFILA**.

TRIGONOMETRY,

THE art of measuring the sides and angles of triangles, either plane or spherical, whence it is accordingly called either **PLANE TRIGONOMETRY**, or **SPHERICAL TRIGONOMETRY**.

Trigonometry is an art of the greatest use in the mathematical sciences, especially in astronomy, navigation, surveying, dialing, geography, &c. &c. By it we come to know the magnitude of the earth, the planets and stars, their distances, motions, eclipses, and almost all other useful arts and sciences. Accordingly we find this art has been cultivated from the earliest ages of mathematical knowledge.

Trigonometry, or the resolution of triangles, is founded on the mutual proportions which subsist between the sides and angles of triangles; which proportions are known by finding the relations between the radius of a circle and certain other lines drawn in and about the circle, called *cords*, *sines*, *tangents*, and *secants*. The ancients, Menelaus, Hipparchus, Ptolemy, &c. performed their trigonometry by means of the cords. As to the sines, and the common theorems relating to them, they were introduced into trigonometry by the Moors or Arabians, from whom this art passed into Europe, with several other branches of science. The Europeans have introduced, since the 15th century, the tangents and secants, with the theorems relating to them.

The proportion of the sines, tangents, &c. to their radius, is sometimes expressed in common or natural numbers, which constitute what we call the *tables of natural sines, tangents, and secants*. Sometimes it is expressed in logarithms, being the logarithms of the said natural sines, tangents, &c.; and these constitute the table of *artificial sines*, &c. Lastly, sometimes the proportion is not expressed in numbers; but the several sines, tangents, &c. are actually laid down upon lines of scales; whence the *line of sines*, of *tangents*, &c.

In trigonometry, as angles are measured by arcs of a circle described about the angular point, so the whole circumference

TRIGONELLA, FENUGREEK, in botany: a genus of plants belonging to the class of *diadelphia*, and order of *decandria*; and in the natural system arranged under the 32d order, *Papilionaceæ*. The vexillum and alas are nearly equal and patent, resembling a tripetalous corolla. There are twelve species; of which the most remarkable is the *fenugracum*, or fenugreek, a native of Montpelier in France. Fenugreek is an annual plant, which rises with a hollow, branching, herbaceous stalk, a foot and a half long, garnished with trifoliate leaves, placed alternately, whose lobes are oblong, oval, indented on their edges, and have broad furrowed footstalks. Fenugreek seeds have a strong disagreeable smell, and an unctuous farinaceous taste accompanied with a slight bitterness. The principal use of these seeds is in cataplasms and fomentations, for softening, maturing, and dissolving tumors; and in emollient and carminative glysters. They are an ingredient in the *oleum e mucilaginibus* of the shops, to which they communicate a considerable share of their smell, but this is not now in use.

of the circle is divided into a great number of parts; as 360 degrees, and each degree into 60 minutes, and each minute into 60 seconds, &c.; and then any angle is said to consist of so many degrees, minutes, and seconds, as are contained in the arc that measures the angle, or that is intercepted between the legs or sides of the angle.

Now the sine, tangent, and secant, &c. of every degree and minute, &c. of a quadrant, are calculated to the radius 1, and ranged in tables for use; as also the logarithms of the same; forming the triangular canon. And these numbers, so arranged in tables, form every species of right-angled triangles; so that no such triangle can be proposed, but one similar to it may be there found, by comparison with which the proposed one may be computed by analogy or proportion.

PLANE TRIGONOMETRY.

THERE are usually three methods of resolving triangles, or the cases of trigonometry; viz. geometrical construction, arithmetical computation, and instrumental operation. In the first method, the triangle in question is constructed by drawing and laying down the several parts of their magnitudes given, viz. the sides from a scale of equal parts, and the angles from a scale of cords or other instrument; then the unknown parts are measured by the same scales, and so they become known.

In the second method, having stated the terms of the proportion according to rule, which terms consist partly of the numbers of the given sides, and partly of the sines, &c. of angles taken from the tables, the proportion is then resolved like all other proportions, in which a fourth term is to be found from three given terms, by multiplying the second and third together, and dividing the product by the first. Or, in working with the logarithms, adding the logarithm of the

second and third terms together, and from the sum subtracting the logarithm of the first term; then the number answering to the remainder is the fourth term sought.

To work a case instrumentally, as suppose by the logarithm lines on one side of the two foot scales: Extend the compasses from the first term to the second or third, which happens to be of the same kind with it; then that extent will reach from the other term to the fourth. In this operation, for the sides of triangles, is used the line of numbers (marked Num.); and for the angles, the line of sines or tangents (marked sin. and tan.) according as the proportion respects sines or tangents. See SECTION.

In every case of plane triangles there must be three parts, one at least of which must be a side. And then the different circumstances, as to the three parts that may be given, admit of three cases or varieties only; viz.

First, When two of the three parts given are a side and its opposite angle. Second, When there are given two sides and their contained angle. And, thirdly, When the three sides are given.

To each of these cases there is a particular rule or proportion adapted for resolving it by.

First, *The Rule for the first Case*, or that in which, of the three parts that are given, an angle and its opposite side are two of them, is this, viz. that the sides are proportional to the sines of their opposite angles; that is,

As one side given :
To the sine of its opposite angle : :
So is another side given :
To the sine of its opposite angle.

Or, As the sine of an angle given :
To its opposite side : :
So is the sine of another angle given :
To its opposite side.

So that, to find an angle, we must begin the proportion with a given side that is opposite to a given angle; and to find a side, we must begin with an angle opposite to a given side.

Example. Suppose in the triangle BDC (Pl. i. fig. 1.) there be given the side BC = 106, DB = 65, and the angle BCD $31^{\circ} 49'$ given; to find the angle BDC obtuse and the side CD,

1. *Geometrically by Construction.*

Draw the line BC equal to 106, at C make an angle of $31^{\circ} 49'$ by drawing CD, take 65 in your compasses, and with one foot in B lay the other upon the line CD in D; draw the line BD, and it is done; for the angle D will be $120^{\circ} 43'$, the angle B $27^{\circ} 28'$, and the side DC 56.9 as was required.

2. *Arithmetically by Logarithms.*

As the side BD 65 log. 1.81291
Is to sine angle C $31^{\circ} 49'$ - - - 9.72198
So is the side BC 106 - - - 2.02531

11.74729
1.81291

To find angle D $120^{\circ} 43'$ - - - 9.93438

To find DC. 180.0
As sine ang. C $31^{\circ} 49'$ 9.72198 The supp. 59.17 of ang. D.

Is to the side BD 65 1.81291 120.43 angle D.
So is sine ang. B $27^{\circ} 28'$ 9.66392 31.49 angle C.

11.47683
9.72198
152.32 their sum.

To the side DC 56.88 1.75485 180.0
152.32 sum subt.

27.28 angle B.

Here it may be proper to observe, that if the given angle be obtuse, the angle sought will be acute; but when the given angle is acute, and opposite to a lesser given side, then the required angle is doubtful, whether acute or obtuse; it ought therefore to be determined before the operation. For it is plain the above proportion produces $59^{\circ} 17'$ for the required angle; but as it is obtuse, its supplement to 180 degrees must be taken, viz. $120^{\circ} 43'$.

By Gunter.

"The extent from 65 to 106 on the line of numbers will reach from $31^{\circ} 49'$ to $59^{\circ} 17'$ on the line of sines."

Secondly, "The extent from $31^{\circ} 49'$ to $27^{\circ} 28'$ on the line of sines will reach from 65 to 56.88 on the line of numbers."

CASE II. When there are given two sides and their contained angle, to find the rest, the rule is this:

As the sum of the two given sides :
Is to the difference of the sides : :
So is the tangent of half the sum of the two opposite angles or cotangent of half the given angle :

To tang. of half the diff. of those angles.

Then the half diff. added to the half sum, gives the greater of the two unknown angles; and subtracted leaves the less of the two angles.

Hence, the angles being now all known, the remaining third side will be found by the former case.

Example. The side BC = 109, BD = 76 (fig. 2.), and the angle CBD $101^{\circ} 30'$ given, to find the angle BDC or BCD, and the side CD.

1. *Geometrically by Construction.*

Draw the line BC 109, and BD, so as to make an angle with BC of $101^{\circ} 30'$, and make BD equal to 76; join BC and BD with a right line, and it is done; for the angle D being measured by the cord of 60° , will be $47^{\circ} 32'$; angle C $30^{\circ} 58'$, and the side DC 144.8, as was required.

2. *Arithmetically by Logarithms.*

Side BC 109 - 109 - 180.0
BD 76 - 76 - 101.30

Their sum 185 33 their diff. 78 30 sum of the ang.
D and C.

$\frac{1}{2}$ Sum $39^{\circ} 15'$ then.

To find the angles D and C.

As the sum of the sides BC and BD = 185 2.26717

Is to their difference - - - 33 1.51851

So is tang. of $\frac{1}{2}$ the sum of the angles C and D $39^{\circ} 15'$ 9.91224

11.43075
2.26717

To the tang. of $\frac{1}{2}$ the diff. of the angles C and D $8^{\circ} 17'$ 9.16358

To half the sum of the angles D and C 39.15
Add half the difference of the angles C and D 8 17

Gives the greater angle D 47.32

Subtracted, gives the lesser angle C $30^{\circ} 58'$

To find DC.

As sine angle D $47^{\circ} 32'$ - - - 9.86786

Is to the side BC 109 - - - 2.03743

So is sine angle B $101^{\circ} 30'$ - - - 9.99119

12.02862
9.86786

To the side DC required 144.8 2.16070

3. By Gunter.

1A. "The extent from 185 to 33 on the line of numbers will reach from $39^{\circ} 15'$ to $8^{\circ} 17'$ on the line of tangents. 2dly, The extent from angle D $47^{\circ} 32'$ to $78^{\circ} 30'$ (the supplement of angle B) on the line of sines, will reach from the side BC 109 to 144.8, the side DC required, on the line of numbers."

CASE III. Is when the three sides are given, to find the three angles; and the method of resolving this case is, to let a perpendicular fall from the greatest angle upon the opposite side or base, dividing it into two segments, and the whole triangle into two smaller right-angled triangles: then it will be,

As the base or sum of the two segments :
Is to the sum of the other two sides ::
So is the difference of those sides :
To the difference of the segments of the base.

Then half this difference of the two segments added to the half sum, or half the base, gives the greater segment, and subtracted gives the less. Hence, in each of the two right-angled triangles, there are given the hypotenuse, and the base, besides the right angle, to find the other angles by the first case.

Example. The sides BC (fig. 3.) = 105, BD = 85, and CD = 50, given to find the angles BDC, BCD, or CBD.

1. Geometrically by Construction.

Draw the line BC equal to 105, take CD 50 in your compasses, and with one foot in C describe an arch; then take BD 85 in your compasses, and with one foot in B cut the former arch in D, join BD and DC, and it is done; for the angle B, being measured, will be found $28^{\circ} 4'$, angle C $53^{\circ} 7'$, which being added together, is $81^{\circ} 11'$, their sum subtracted from 180, leaves angle D $98^{\circ} 49'$ as was required.

2. Arithmetically by Logarithms.

The two shortest sides are BD (= 85) and CD (= 50), the sum of which is 135, and their difference 35. The segments of the base BC are found in this manner:

As the side BC = 105 log. 2.02119
Is to the sum of the sides BD & DC = 135 = 2.13033
So is their difference = 35 = 1.54407
To the difference of the seg. of BC = 45 = 1.65321
Thus the sum and difference of the segments of the base BC being known, we have only to add half this sum = $52\frac{1}{2}$ to half the difference = 22 $\frac{1}{2}$, and we shall obtain the greater segment, which is = 75; which subtracted from 105, gives 30 = the smaller segment. Then

To find the angle BDA.

As the Hypotenuse BD = 85 log. 1.92942
Is to radius = 10.00000
So is the greater segment = 75 = 1.87506
To the sum of the angle BDA = 9.94564
The angle BDA therefore is equal to $61^{\circ} 56'$

Let us now find the angle ADC, which is done thus.

As the hypotenuse DC = 50 log. 1.69897
Is to radius = 10.00000
So is the smaller segment = 30 = 1.47712
To the sine of ADC = 9.77815
The angle ADC therefore is equal to $36^{\circ} 53'$, and the whole angle BDC = $98^{\circ} 49'$.

To find the angle at B, we have only to subtract the angle BDA (= $61^{\circ} 56'$) from 90° , and the rem. $28^{\circ} 4'$ is the angle sought. The angle at C is equal to $53^{\circ} 7'$.

3. By Gunter.

1st, "The extent from 105 to 135, will reach from 35 to 45 on the line of numbers." 2dly, "The extent from 85 to 35, on the line of numbers, will reach from radius to $61^{\circ} 56'$,

the angle BDA on the line of sines." 3dly, "The extent from 50 to 30 on the line of numbers, will reach from radius to angle ADC $36^{\circ} 53'$ on the line of sines."

The foregoing three cases include all the varieties of plane triangles that can happen, both of right and oblique-angled triangles. But besides these, there are some other theorems that are useful upon many occasions, or suited to some particular forms of triangles, which are often more expeditious in use than the foregoing general ones; one of which, for right-angled triangles, as the case for which it serves is often occurs, may be here inserted, and is as follows.

CASE IV. When in a right-angled triangle, there are given the angles and one leg, to find the other leg, or the hypotenuse. Then it will be

As radius :
To given leg AB :
So is tang. adjacent the angle A :
To the opposite leg BC, and :
So is sec. of same angle A :
To hypot. AC.

Example. In the triangle ABC (fig. 4.), right-angled at B,

Given the leg AB = 162
and the angle A = $53^{\circ} 7' 48''$ } to find BC
conseq. the angle C = $36^{\circ} 52' 12''$ and AC.

1. Geometrically.—Draw the leg AB = 162: erect the indefinite perpendicular BC: make the angle A = $53^{\circ} 7'$, and the side AC will cut BC in C, and form the triangle ABC. Then by measuring, there will be found AC = 270, and BC = 216.

2. Arithmetically.

As radius	= 10	-	-	log. 10.0000000
To AB	= 162	-	-	2.2095150
So is tang. A	= $53^{\circ} 7' 48''$	-	-	10.1249372
To BC	= 216	-	-	2.3344522
So is sec. A	= $53^{\circ} 7' 48''$	-	-	10.2218477
To AC	= 270	-	-	2.4313627

3. By Gunter.

Extend the compasses from 45° at the end of the tangents (the radius) to the tangent of $53^{\circ} 7'$; then that extent will reach, on the line of numbers, from 162 to 216, for BC. Again, extend the compasses from $36^{\circ} 52'$ to 90 on the sines; then that extent will reach, on the line of numbers, from 162 to 270 for AC.

Note. Another method, by making every side radius, is often added by the authors on trigonometry, which is thus: the given right-angled triangle being ABC, make first the hypotenuse AC radius, that is, with the extent of AC as a radius, and each of the centres A and C, describe arcs CD and AE (fig. 5.); then it is evident that each leg will represent the sine of its opposite angle, viz. the leg BC the sine of the arc CD or of the angle A, and the leg AB the sine of the arc AE or of the angle C. Again, making either leg radius, the other leg will represent the tangent of its opposite angle, and the hypotenuse the secant of the same angle; thus, with radius AB and centre A describing the arc BF, BC represents the tangent of that arc, or of the angle A, and the hypotenuse AC the secant of the same; or with the radius BC and centre C describing the arc BG, the other leg AB is the tangent of that arc BG or of the angle C, and the hypotenuse CA the secant of the same.

And then the general rule for all these cases is this, viz, that the sides bear to each other the same proportions as the parts or things which they represent. And this is called making every side radius.

SPHERICAL TRIGONOMETRY.

SPHERICAL TRIGONOMETRY is the art whereby, from three given parts of a spherical triangle, we discover the rest; and, like plane trigonometry, is either right-angled or oblique-angled. But before we give the analogies for the solution of the several cases in either, it will be proper to premise the following theorems:

THEOREM I. In all right-angled spherical triangles, the sign of the hypotenuse : radius :: sine of a leg : sine of its opposite angle. And the sine of a leg : radius :: tangent of the other leg : tangent of its opposite angle.

Demonstration. Let EDAFG (*ibid.* fig. 6.) represent the eighth part of a sphere, where the quadrantal planes EDFG, EDBC, are both perpendicular to the quadrantal plane ADFB; and the quadrantal plane ADGC is perpendicular to the plane EDFG; and the spherical triangle ABC is right-angled at B, where CA is the hypotenuse, and BA, BC, are the legs.

To the arches GF, CB, draw the tangents HF, OB, and the sines GM, CI, on the radii DF, DB; also draw BL the sine of the arch AB, and CK the sine of AC; and then join IK and OL. Now HF, OB, GM, CI, are all perpendicular to the plane ADFB. And HD, GK, OL, lie all in the same plane ADGC. Also FD, IK, BL, lie all in the same plane ADGC. Therefore the right-angled triangles HFD, CIK, ODL, having the equal angles HDF, CKI, OLB, are similar. And CK : DG :: CI : GM; that is, as the sine of the hypotenuse : rad. :: sine of a leg : sine of its opposite angle. For GM is the sine of the arc GF, which measures the angle CAB. Also, LB : DF :: BO : FH : that is, as the sine of a leg : radius :: tangent of the other leg : tangent of its opposite angle. Q. E. D.

Hence it follows, that the sines of the angles of any oblique spherical triangle ACD (fig. 7.) are to one another, directly, as the sines of the opposite sides. Hence it also follows, that, in right-angled spherical triangles, having the same perpendicular, the sines of the bases will be to each other, inversely, as the tangents of the angles at the bases.

THEOREM II. In any right-angled spherical triangle ABC (fig. 8.) it will be, As radius is to the co-sine of one leg, so is the co-sine of the other leg to the co-sine of the hypotenuse.

Hence, if two right-angled spherical triangles ABC, CBD (fig. 7.) have the same perpendicular BC, the co-sines of their hypotenuses will be to each other, directly, as the co-sines of their bases.

THEOREM III. In any spherical triangle it will be, As radius is to the sine of either angle, so is the co-sine of the adjacent leg to the co-sine of the opposite angle.

Hence, in right-angled spherical triangles, having the same perpendicular, the co-sines of the angles at the base will be to each other, directly, as the sines of the vertical angles.

THEOREM IV. In any right-angled spherical triangle it will be, As radius is to the co-sine of the hypotenuse, so is the tangent of either angle to the co-tangent of the other angle.

As the sum of the sines of two unequal arches is to their difference, so is the tangent of half the sum of those arches to the tangent of half their difference: and as the sum of the co-sines is to their difference, so is the co-tangent of half the sum of the arches to the tangent of half the difference of the same arches.

THEOREM V. In any spherical triangle ABC (fig. 9. and 10.) it will be, As the co-tangent of half the sum of half their difference, so is the co-tangent of half the base to the tangent of the distance (DE) of the perpendicular from the middle of the base.

Since the last proportion, by permutation, becomes co-tang. $\frac{AC+BC}{2}$: co-tang. AE :: tang. $\frac{AC-BC}{2}$: tang.

DE, and as the tangents of any two arches are, inversely, as their co-tangents; it follows, therefore, that tang. AE :

tang. $\frac{AC+BC}{2}$:: tang. $\frac{AC-BC}{2}$: tang. DE; or, that the

tangent of half the base is to the tangent of half the sum of the sides, as the tangent of half the difference of the sides to the tangent of the distance of the perpendicular from the middle of the base.

THEOREM VI. In any spherical triangle ABC (fig. 9.) it will be, As the co-tangent of half the sum of the angles at the base is to the tangent of half their difference, so is the tangent of half the vertical angle to the tangent of the angle which the perpendicular CD makes with the line CF bisecting the vertical angle.

The following propositions and remarks, concerning spherical triangles (selected and communicated to Dr. Hutton by the Reverend Nevil Maskelyne, D. D. Astronomer Royal, F. R. S.), will also render the calculation of them perspicuous, and free from ambiguity.

1. A spherical triangle is equilateral, isosceles, or scalene, according as it has its three angles all equal, or two of them equal, or all three unequal; and *vice versa*.
2. The greatest side is always opposite the greatest angle, and the smallest side opposite the smallest angle.
3. Any two sides taken together are greater than the third.
4. If the three angles are all acute, or all right, or all obtuse; the three sides will be, accordingly, all less than 90° , or equal to 90° , or greater than 90° ; and *vice versa*.
5. If from the three angles A, B, C, of a triangle ABC, as poles, there be described, upon the surface of the sphere, three arches of a great circle DE, DF, FE, forming by their intersections a new spherical triangle DEF; each side of the new triangle will be the supplement of the angle at its pole; and each angle of the same triangle will be the supplement of the side opposite to it in the triangle ABC.
6. In any triangle ABC, or A'B'C, right-angled in A, 1st, The angles at the hypotenuse are always of the same kind as their opposite sides; 2dly, The hypotenuse is less or greater than a quadrant, according as the sides including the right angle are of the same or different kinds; that is to say, according as these same sides are either both acute or both obtuse, or as one is acute and the other obtuse. And *vice versa*, 1st, The sides including the right angle are always of the same kind as their opposite angles; 2dly, The sides including the right angle will be of the same or different kinds, according as the hypotenuse is less or more than 90° ; but one at least of them will be of 90° , if the hypotenuse is so.

TRIGONOMETRY.

The Solution of the CASES of right-angled spherical Triangles (fig. 8.)

Case	Given	Sought	Solution
1	The hyp. AC and one angle A	The opposite leg BC	As radius : sine hyp. AC : : sine A : sine BC (by the former part of theor. 1.)
2	The hyp. AC and one angle A	The adjacent leg AB	As radius : co-sine of A : : tang. AC : tang. AB (by the latter part of theor. 1.)
3	The hyp. AC and one angle A	The other angle C	As radius : co-sine of AC : : tang. A : co-tang. C (by theorem 4.)
4	The hyp. AC and one leg AB	The other leg BC	As co-sine AB : radius : : co-sine AC : co-sine BC (by theorem 2.)
5	The hyp. AC and one leg AB	The opposite angle C	As sine AC : radius : : sine AB : sine C (by the former part of theorem 1.)
6	The hyp. AC and one leg AB	The adjacent angle A	As tang. AC : tang. AB : : radius : co-sine A (by theorem 1.)
7	One leg AB and the adjacent angle A	The other leg BC	As radius : sine AB : : tangent A : tangent BC (by theorem 4.)
8	One leg AB and the adjacent angle A	The opposite angle C	As radius : sine A : : co-sine of AB : co-sine of C (by theorem 3.)
9	One leg AB and the adjacent angle A	The hyp. AC	As co-sine of A : radius : : tang AB : tang. AC (by theorem 1.)
10	One leg BC and the opposite angle A	The other leg AB	As tang. A : tang. BC : : radius : sine AB (by theorem 4.)
11	One leg BC and the opposite angle A	The adjacent angle C	As co-sine BC : radius : : co-sine of A : sine C (by theorem 3.)
12	One leg BC and the opposite angle A	The hyp. AC	As sine A : sine BC : : radius : sine AC (by theorem 1.)
13	Both legs AB and BC	The hyp. AC	As radius : co-sine AB : : co-sine BC : co-sine AC (by theorem 2.)
14	Both legs AB and BC	An angle, suppose A	As sine AB : radius : : tang. BC : tang. A (by theorem 4.)
15	Both angles A and C.	A leg, suppose AB	As sine A : co-sine C : : radius : co-sine AB (by theorem 3.)
16	Both angles A and C	The hyp. AC	As tang. A : co-tang. C : : radius : co-sine AC (by theorem 4.)

Note. The 10th, 11th, and 12th cases are ambiguous : since it cannot be determined by the data, whether ABC, and AC, be greater or less than 90° degrees each.

The Solution of the CASES of oblique spherical TRIANGLES (fig. 9 and 10.)

Case	Given	Sought	Solution
1	Two sides AC, BC, and an angle A opposite to one of them	The angle B opposite to the other.	As sine BC : sine A :: sine AC : sine B (by theorem 1.) Note, this case is ambiguous when BC is less than AC; since it cannot be determined from the data whether B be acute or obtuse.
2	Two sides AC, BC, and an angle A opposite to one of them	The included angle ACB	Upon AB produced (if need be) let fall the perpendicular CD; then (by theorem 4.) rad. : co-sine AC :: tang. A : co-tang. ACD; but (by theorem 1.) as tang. BC : tang. AC :: co-sine ACD : co-sine BCD. Whence $ACB = AC \pm BCD$ is known.
3	Two sides AC, BC, and an angle A opposite to one of them	The other side AB	As rad. : co-sine A :: tang. AC : tang. AD (by theor. 1.) and (by theor. 2.) as co-sine AC : co-sine BC :: co-sine AD : co-sine BD. Note, this and the last case are both ambiguous when the first is so.
4	Two sides AC, AB, and the included angle A	The other side BC	As rad. : co-sine A :: tang. AC : tang. AB (by theor. 1.) whence AD is also known; then (by theor. 2.) as co-sine AD : co-sine BD :: co-sine AC : co-sine BC.
5	Two sides AC, AB, and the included angle A	Either of the other angles, suppose B	As rad. : co-sine A :: tang. AC : tang. AD (by theor. 1.) whence BD is known; then (by theor. 4.) as sine BD : sine AD :: tang. A : tang. B.
6	Two angles A, ACB, and the side AC betwixt them	The other angle B	As rad. : co-sine AB :: tang. A : co-tang. ACD (by theorem 4.) whence BCD is also known; then (by theor. 3.) as sine ACD : sine BCD :: co-sine A : co-sine B.
7	Two angles A, ACB, and the side AC betwixt them	Either of the other sides, suppose BC	As rad. : co-sine AC :: tang. A : co-tang. ACD (by theorem 4.) whence BCD is also known; then, as co-sine BCD : co-sine ACD :: tang. AC : tang. BC (by theor. 1.)
8	Two angles A, B, and a side AC opposite to one of them	The side BC opposite the other	As sine B : sine AC :: sine A : sine BC (by theorem 1.)
9	Two angles A, B, and a side AC opposite to one of them	The side AB betwixt them	As rad. : co-sine A :: tang. AC : tang. AD (by theor. 1.) and as tang. B : tang. A :: sine AD : sine BD (by theor. 4.) whence AB is also known.
10	Two angles A, B, and a side AC opposite to one of them	The other angle ACB	As rad. : co-sine AC :: tang. A : co-tang. ACD (by theorem 4.) and as co-sine A : co-sine B :: sine ACD : sine BCD (by theor. 3.) whence ACB is also known.
11	All the three sides AB, AC, and BC,	An angle, suppose A	As tang. $\frac{1}{2}$ AB : tang. $\frac{AC+BC}{2}$:: tang. $\frac{AC-BC}{2}$: tang. DE the distance of the perpendicular from the middle of the base (by theorem 6.) whence AD is known: then, as tang. AC : tang. AD :: rad. : co-sine A (by theor. 1.)
12	All the three angles A, B, and ACB	A side, suppose AC	As co-tang. $\frac{ABC+A}{2}$: tang. $\frac{ABC-A}{2}$:: tang. $\frac{ACB}{2}$: tang. of the angle included by the perpendicular and a line bisecting the vertical angles; whence ACD is also known: then (by theorem 5.) tang. A : co-tang. ACD :: rad. : co-sine AC.

TRI

TRIHLATÆ, from *tres*, “three,” and *hilum*, “an external mark on the seed;” the name of the 23d class in Linnæus’s Fragments of a Natural Method; consisting of plants with three seeds, which are marked with an external cicatrix or scar, where they are fastened within the fruit. See BOTANY.

TRIM, implies in general the state or disposition by which a ship is best calculated for the several purposes of navigation. Thus the *trim of the hold* denotes the most convenient and proper arrangement of the various materials contained therein relatively to the ship’s motion or stability at sea. The trim of
VOL. X.

TRI

the masts and sails is also their most apposite situation with regard to the construction of the ship and the effort of the wind upon her sails. See SEAMANSHIP.

TRINGA, SANDPIPER; a genus of birds belonging to the order of *gallæ*. The bill is somewhat tapering, and of the length of the head; the nostrils are small; the toes are four in number and divided, the hind toe being frequently raised from the ground. According to Dr. Latham there are forty-five species, of which eighteen are British. We shall describe some of the most remarkable.

1. *Vanellus*, lapwing, or tewit, is distinguished by having
G

the bill, crown of the head, crest, and throat, of a black colour; there is also a black line under each eye; the back is of a purplish green; the wings and tail are black and white, and the legs red: the weight is eight ounces and the length thirteen inches. It lays four eggs, making a slight nest with a few bents. The eggs have an olive cast, and are spotted with black. The young, as soon as hatched, run like chickens: the parents show remarkable solicitude for them, flying with great anxiety and clamour near them, striking at either men or dogs that approach, and often fluttering along the ground like a wounded bird, to a considerable distance from their nest, to delude their pursuers; and to aid the deceit, they become more clamorous when most remote from it: the eggs are held in great esteem for their delicacy, and are sold by the London poulterers for three shillings the dozen. In winter, lapwings join in vast flocks; but at that season are very wild: their flesh is very good, their food being insects and worms. During October and November, they are taken in the fens in nets, in the same manner that ruffs are; but are not preserved for fattening, being killed as soon as caught.

2. *Pugnax*. The male of this species is called *ruff*, and the female *reeve*. The name *ruff* is given to the males because they are furnished with very long feathers, standing out in a remarkable manner, not unlike the ruff worn by our ancestors. The ruff is of as many different colours as there are males; but in general it is barred with black; the weight is six or seven ounces; the length one foot. The female, or *reeve*, has no ruff; the common colour is brown; the feathers are edged with a very pale colour; the breast and belly white. Its weight is about four ounces.

These birds appear in the fens in the earliest spring, and disappear about Michaelmas. The reeves lay four eggs in a tuft of grass, the first week in May, and sit about a month. The eggs are white, marked with large rusty spots. Fowlers avoid in general the taking of the females; not only because they are smaller than the males, but that they may be left to breed.

Soon after their arrival, the males begin to hill, that is, to collect on some dry bank near a splash of water, in expectation of the females, who resort to them. Each male keeps possession of a small piece of ground, which it runs round till the grass is worn quite away, and nothing but a naked circle is left. When a female lights, the ruffs immediately fall to fighting. It is a vulgar error, that ruffs must be fed in the dark lest they should destroy each other by fighting on admission of light. The truth is, every bird takes its stand in the room as it would in the open fen. If another invades its circle, an attack is made, and a battle ensues. They make use of the same action in fighting as a cock, place their bills to the ground and spread their ruffs. Mr. Pennant says, he has set a whole room full a fighting, by making them move their stations; and after quitting the place, by peeping through a crevice, seen them resume their circles and grow pacific.

When a fowler discovers one of those hills, he places his net over night, which is of the same kind as those that are called *clap* or *day nets*; only it is generally single, and is about fourteen yards long and four broad. The fowler resorts to his stand at day-break, at the distance of one, two, three, or four hundred yards from the nets, according to the time of the season; for the later it is, the slyer the birds grow. He then makes his first pull, taking such birds as he finds within reach: after that he places his stuffed birds or stakes to entice those that are continually traversing the fen. When the fakes are set, seldom more than two or three are taken at a time. A fowler will take forty or fifty dozen in a season.—These birds are found in Lincolnshire, the Isle of Ely, and in the East Riding of York. They visit a place called

Martin-Mere in Lancashire the latter end of March or beginning of April; but do not continue there above three weeks; where they are taken in nets, and fattened for the table with bread and milk, hempseed, and sometimes boiled wheat; but if expedition is required, sugar is added, which will make them in a fortnight's time a lump of fat: they then sell for two shillings or half a crown a-piece. They are dressed like the woodcock, with their intestines; and when killed at the critical time, say the Epicures, are the most delicious of all mortals.

3. *Canutus*, or knot, has the forehead, chin, and lower part of the neck, brown, inclining to ash-colour; the back and scapulars deep brown, edged with ash-colour; the coverts of the wings white, the edges of the lower order deeply so, forming a white bar; the breast, sides, and belly, white, the two first streaked with brown; the coverts of the tail marked with white and dusky spots alternately; the tail ash-coloured, the outmost feather on each side white; the legs of a bluish grey; and the toes as a special mark, divided to the very bottom; the weight four ounces and a half.—These birds, when fattened, are preferred by some to the ruffs themselves. They are taken in great numbers on the coasts of Lincolnshire, in nets such as are employed in taking ruffs; with two or three dozens of fakes of wood painted like the birds, placed within; 14 dozens have been taken at once. Their season is from the beginning of August to that of November. They disappear with the first frosts. Camden says, they derive their name from King Canute, Knute, or Knout, as he is sometimes called; probably because they were a favourite dish with that monarch. We know that he kept the feast of the purification of the Virgin Mary with great pomp and magnificence at Ely; and this being one of the fen birds, it is not unlikely but he met with it there.

4. The *hypoleucos*, or common sandpiper, except in pairing time, is a solitary bird: it is never found near the sea, but frequents rivers, lakes, and other fresh waters. Its head is brown, streaked with downward black lines; the neck an obscure ash-colour; the back and coverts of the wings brown, mixed with a glossy green, elegantly marked with transverse dusky lines; the breast and belly are of a pure white; the quill feathers and the middle feathers of the tail are brown; the legs of a dull pale green.

5. The *alpina*, or dunling sandpiper, is at once distinguished from the others by the singularity of its colours. The back, head, and upper part of the neck, are ferruginous; marked with large black spots; the lower part of the neck white, marked with short dusky streaks; the coverts of the wings ash-colour; the belly white, marked with large black spots, or with a black crescent pointing towards the thighs; the tail is ash-coloured; legs black; toes divided to their origin. In size it is superior to that of a lark. These birds are found on our sea-coasts: but may be reckoned among the more rare kinds. They lay four eggs of a dirty white colour, blotched with brown round the thicker end, and marked with a few small spots of the same colour on the smaller end. They are common on the Yorkshire coasts, and esteemed a great delicacy.

6. The *cinclus*, purr, or stint, is in length $7\frac{1}{2}$ inches; the head and hind part of the neck are ash-coloured, marked with dusky lines; a white stroke divides the bill and eyes; the back is of a brownish ash-colour; the breast and belly white; the coverts of the wings and tail a dark brown, edged with light ash-colour or white; the upper part of the quill feathers dusky, the lower white; the legs of a dusky green; the toes divided to their origin. The bill an inch and a half long, slender and black; irides dusky.—These

birds come in prodigious flocks on our sea-coasts during the winter: in their flight they perform their evolutions with great regularity; appearing like a white or a dusky cloud, as they turn their backs or their breasts towards you. They leave our shores in spring, and retire to some unknown place to breed. They were formerly a well known dish at our tables.

TRINIDAD, an Island in the gulf of Mexico, separated from New Andalusia, in Terra Firma, by a strait, about three miles over. The soil is fruitful, producing sugar, cotton, Indian corn, fine tobacco, and fruits; but the air is unhealthy. It is about 62 miles in length, and 45 in breadth; and was discovered by Christopher Columbus in 1498. There is a bituminous lake in this island.

TRINITARIANS, those who believe in the Trinity: those who do not believe therein being called *Antitrinitarians*.

TRINITY, in theology, the ineffable mystery of three persons in one God; Father, Son, and Holy Spirit. See **THEOLOGY**.

TRINITY-House. See **LONDON**.

TRINITY-Sunday, a festival observed on the Sunday next after WhitSunday, in honour of the holy Trinity. The observation of this festival was first enjoined in the council of Arles, anno 1260.

TRINOANTES (anc. geog.) a people of Britain, supposed to have occupied Middlesex and Essex.

TRIO, in music, a part of a concert wherein three persons sing; or more properly, a musical composition consisting of three parts.

TRIPHTHONG, in grammar, an assemblage or concurrence of three vowels in one syllable; as *que*.

TRIPLE, in music, is one of the species of measure or time. See **MUSIC**.

TRIPOD, in antiquity, a famed sacred seat or stool, supported by three feet, whereon the priests and sibyls were placed to render oracles. It was on the tripod that the gods were said to inspire the Pythias with that divine fury and enthusiasm wherewith they were seized at the delivery of their predictions.

TRIPOLI, a country of Africa, in Barbary: bounded on the north by the Mediterranean sea; on the south, by the country of the Berberies; on the west, by the kingdom of Tunis, Biledulgerid, and a territory of the Gadamis; and on the east, by Egypt. It is about 925 miles along the sea coast; but the breadth is various. Some parts of it are pretty fruitful; but that towards Egypt is a sandy desert. It had the title of a *kingdom*; but is now a republic governed by a dey. He is not absolute, for a Turkish bashaw resides here, who receives his authority from the grand seignior, and has a power of controlling the dey, and levying taxes on the people. The dey is elected by the soldiers, who make no scruple of deposing him when they please.

TRIPOLI, a considerable town of Africa, and capital of a republic of the same name in Barbary, and under protection of the grand seignior, with a castle and a fort. It is pretty large, and the inhabitants are noted pirates. It was taken by Charles V. who settled the knights of Malta there; but they were driven away by the Turks in 1551. It was formerly very flourishing; and has now some trade in stuffs, saffron, corn, oil, wool, dates, ostrich feathers, and skins: but they make more of the Christian slaves which they take at sea; for they either set high ransoms upon them, or make them perform all sorts of work. It is seated on the coast of the Mediterranean, in a sandy soil, and surrounded by a wall, strengthened by other fortifications. E. Long. 13. 12. N. Lat. 32. 34.

TRIPOLI, called *Tripolis of Syria*, to distinguish it from Tripoli in Barbary, received its name from its being anciently formed of three cities at a small distance from each other, one of which belonged to the Aradians, or ancient kingdom of Arad, the second to the Sidonians, and the third to the Tyrians, perhaps as a common mart to those maritime powers. The present town of Tripoli is built at the distance of a mile and a half from the other, upon the declivity of a hill facing the sea, in 34° 20' north latitude, and in 35° 50' east longitude from Greenwich. It is surrounded with walls, fortified with seven high strong towers, and a castle, all of Gothic architecture; but the streets are narrow, and the houses low. The city contains about 8000 houses, and near 60,000 inhabitants, consisting of Turks, Christians, and Jews. The basha, or pacha, who resides in the castle, where there is a garrison of 200 janizaries, governs the adjacent territory, in which there is plenty of fruit, and a great number of mulberry-trees, which enable the inhabitants to carry on a silk manufacture, from which they draw considerable profit.

All the environs of Tripoli are laid out in orchards, where the mopal grows spontaneously, and the white-mulberry is cultivated for the silk-worm; the pomegranate, orange, and lemon trees, for their fruit, which is here very fine. The country, though delightful to the eye, is unhealthy; from July to September, epidemic fevers, like those of Scanderoon and Cyprus, prevail, and are principally caused by the artificial inundations made for the purpose of watering the mulberry trees, to enable them to throw out their second leaves, and from a want of free circulation of air, the city being open only to the westward.

TRIPOLI, a genus of argillaceous earth, much used in the polishing of metals. It has its name from Tripoli in Barbary, from whence it was formerly brought to us, and has the following properties: 1. It does not effervesce with any of the acids. 2. It hardens in the fire; and by a considerable heat, its surface becomes vitrified. 3. Every kind of it, excepting that found in England, becomes red by calcination. 4. It is fusible by mixture with calcareous earth, as well as by means of borax and microcosmic salt. 5. Generally no salt can be extracted by washing, though sometimes the marine and vitriolic acid may be extracted by distillation. 6. When crude it imbibes water, but is not diffusible in it. 7. It tastes like common-chalk, and feels sandy between the teeth, though no sand can by any means be extracted from it.

Tripoli is found of two different kinds: 1. Solid, and of a rough texture; brown yellowish, and spotted like marble. 2. Friable and compact; granulated, brown or yellowish; this last being the kind met with in England. This last kind has also been found in Scotland; but the rotten stone found in Derbyshire, and likewise much used in polishing, is quite another substance. According to Ferber, the rotten stone is tripoli mixed with a calcareous earth. In the memoirs of the academy at Paris, for 1769, it is asserted, that tripoli is a volcanic product. In proof of this, we are there informed, that a coal mine at St. Etienne having accidentally taken fire, and the fire having extended to some beds of schistus and bitumen, tripoli was found in the burnt parts of the strata, but no where else. Cronstedt is of opinion, that 100 parts of it contain 90 of siliceous earth, 7 of argill, and 3 of iron; but the red sort probably contains more iron.

TRIPTOLEMUS, laws of. See **MYSTERIES**.

TRIQUETROUS, among botanists, expresses a fruit or leaf that has three sides or faces all flat.

TRIREMIS, in antiquity, a galley with three ranks of oars on a side.

TRISMEGISTUS, an epithet or surname given to one of the two Hermes. See THOTH.

TRISMUS, the LOCKED JAW. See MEDICINE.

TRISSYLLABLE, in grammar, a word consisting of three syllables.

TRITICUM, WHEAT, in botany: a genus of plants belonging to the class of *triandria*, and order of *dignia*; and in the natural system ranging under the 4th order, *Gramina*. The calyx is bivalve, solitary, and generally containing three florets; the corolla is bivalve, one valve being bluntnish, the other acute. There are 15 species; the *astrivum*, summer or spring wheat; *hybernum*, winter Lammas, or common wheat; *compositum*, *turgidum*, or cone-wheat; *polonium*, or Polish wheat; *spelta*, or spelt wheat; *monococcum*, or one-grained wheat; *prostratum*, or trailing wheat-grass; *pumilum*, or dwarf wheat-grass; *juncum*, or rush wheat-grass; *repens*, or couch-grass; *tenellum*, or tender wheat-grass; *maritimum*, or sea wheat-grass; *unilaterale*, or spiked fca-wheat; *uniloides*, or linear spiked wheat-grass.—Of what country the first six species are natives, cannot now be determined: the prostratum is a native of Siberia; the juncum, repens, unilaterale, and maritimum, are natives of Britain; the tenellum is a native of Spain; and the uniloides is a native of Italy. It may also be observed, that the first nine are annuals, the rest are perennials. See HUSBANDRY.

Linnaeus comprehends the different kinds of wheat cultivated at present under six species; but cultivation has produced a great many varieties from these.

1. *Triticum astrivum*, or spring-wheat, hath four flowers in a calyx, three of which mostly bear grain. The calyces stand pretty distant from each other on both sides a flat smooth receptacle. The leaves of the calyx are keel-shaped, smooth, and they terminate with a short arista. The glumes of the flowers are smooth and belying, and the outer leaf of three of the glumes in every calyx is terminated by a long arista, but the three inner ones are beardless. The grain is rather longer and thinner than the common wheat. It is supposed to be a native of some part of Tartary. The farmers call it *Spring Wheat*, because it will come to the sickle with the common wheat, though it be sown in February or March. The varieties of it are: *Triticum astrivum spica et grana rubente*. Spring wheat, with a red spike and grain. *Triticum astrivum rubrum, spica alba*. Red spring wheat, with a white spike. *Triticum astrivum, spica et grana alba*. Spring wheat, with a white spike and grain.—2. *Triticum hybernum*, winter or common wheat, has also four flowers in a calyx, three of which are mostly productive. The calyces stand on each side a smooth flat receptacle, as in the former species, but they are not quite so far asunder. The leaves of the calyx are belying, and so smooth that they appear as if polished, but they have no arista. The glumes of the flowers too are smooth, and the outer ones near the top of the spike are often tipped with short arista. The grain is rather plumper than the former, and is the sort most generally sown in England; whence the name of *common wheat*. Its varieties are: *Triticum hybernum, spica et grana rubente*. Common wheat, with a red spike and grain. *Triticum hybernum rubrum, spica alba*. Common red wheat with a white spike. *Triticum hybernum, spica et grana alba*. Common wheat with a white spike and grain.—3. *Triticum turgidum*, thick spiked or cone-wheat: it is easily distinguished from either of the former; for though it has four flowers in a calyx after the manner of them, yet the whole calyx and the edges of the glumes are covered with soft hairs. The calyces too stand thicker on the receptacle, which make the spike appear more turgid. Some of the outer glumes near the top of the spike are terminated by short arista, like those

of the common wheat. The grain is shorter, plumper, and more convex on the back than either of the former species. Its varieties are numerous, and have various appellations in different counties, owing to the great affinity of several of them. Those most easily to be distinguished are: *Triticum turgidum conicum album*. White cone wheat. *Triticum turgidum conicum rubrum*. Red cone wheat. *Triticum turgidum arisiferum*. Bearded cone wheat. *Triticum turgidum spica multiplici*. Cone wheat, with many ears. The third variety is what the farmers call *clog wheat*, *square wheat*, and *riests*. The grain of this is remarkably convex on one side, and when ripe the awns generally break in pieces and fall off. This sort is very productive, but it yields an inferior flour to what the former two species do.—4. *Triticum Polonicum*, or Polish wheat, has some resemblance to the turgidum, but both grain and spike are longer. The calyx contains very long two flowers, and the glumes are furnished with very long arista; the teeth of the midrib are bearded. As this sort is seldom sown in England, there is no telling what varieties it produces.—5. *Triticum Spelta*, spelt or German wheat. At first view this has a great resemblance to barley, but it has no involucreum. The calyx is truncated; that is, it appears as if the ends were snipped off, and it contains four flowers, two of which are hermaphrodite and the glumes bearded, but the intermediate ones are neuter. There are two rows of grain as in barley, but they are shaped like wheat. It is much cultivated in France, Germany, and Italy. 6. *Triticum monococcum*, St Peter's corn, or one-grained wheat, has three flowers in each calyx alternately bearded, and the middle one neuter. The spike is shining, and has two rows of grain in the manner of barley. Where it grows naturally is not known, but it is cultivated in Germany; and in conjunction with spelt wheat is there made into bread, which is coarse, and not so nourishing as that made of common wheat. Malt made of any of our wheats is often put into beer, and a small quantity of it will give a large brewing a fine brown transparent tincture.

TRITON, a sea demigod, held by the ancients to be an officer or trumpeter of Neptune, attending on him, and carrying his orders from sea to sea.

TRITURATION, the act of reducing a solid body into a subtle powder; called also *pulverization* and *levigation*.

TRIUMPH, in Roman antiquity, a public and solemn honour conferred by the Romans on a victorious general by allowing him a magnificent entry in the city. The greater triumph, called also *curulis*, or simply the *triumph*, was decreed by the senate to a general, upon the conquering of a province or gaining a signal victory. The day appointed for the ceremony being arrived, scaffolds were erected in the forum and circus, and all the other parts of the city where they could best behold the pomp: the senate went to meet the conqueror without the gate called *Capena* or *Triumphalis*, and marched back in order to the Capitol; the ways being cleared and cleansed by a number of officers and tipstaffs, who drove away such as thronged the passage or straggled up and down. The general was clad in a rich purple robe, interwoven with figures of gold, setting forth his great exploits; his buskins were beset with pearl; and he wore a crown, which at first was only laurel, but afterwards gold; in one hand he bore a branch of laurel, and in the other a truncheon. He was carried in a magnificent chariot, adorned with ivory and plates of gold, drawn usually by two white horses; though sometimes by other animals, as that of Pompey, when he triumphed over Africa, by elephants; that of Marc Antony by lions; that of Helioagalbus by tigers; that of Aurelian by deer, &c. His children were at his feet,

and sometimes on the chariot-horses. The procession was led up by the musicians, who played triumphal pieces in praise of the general: these were followed by young men, who led the victims to the sacrifice, with their horns gilded, and their heads adorned with ribands and garlands; next came the carts and waggons, loaded with all the spoils taken from the enemy, with their horses, chariots, &c.; these were followed by the kings, princes, and generals, who had been taken captives, loaded with chains; after these appeared the triumphal chariot, before which, as it passed, they all along strewn flowers, and the people with loud acclamations called out *Io triumphe!* The chariot was followed by the senate, clad in white robes; and the senate by such citizens as had been set at liberty or ransomed; and the procession was closed by the priests and their officers and utensils, with a white ox led along for the chief victim. In this order they proceeded through the triumphal gate, along the via sacra, to the Capitol, where the victims were slain. In the mean time all the temples were open, and all the altars loaded with offerings and incense; games and combats were celebrated in the public places, and rejoicings appeared everywhere.

TRIUMVIR, one of three persons who govern absolutely, and with equal authority, in a state. It is chiefly applied to the Roman government: Cæsar, Pompey, and Crassus, were the first triumvirs who divided the government among them. There were also other officers so called; as the triumviri or tresviri capitales, who were the keepers of the public gaol: they had the office of punishing malefactors; for which purpose they kept eight lictors under them.

TROAS, a country of Phrygia in Asia Minor, of which Troy was the capital. When Troas is taken for the whole kingdom of Priam, it may be said to contain Mysia and Phrygia Minor; but if only applied to that part of the country where Troy was situated, its extent is confined within very narrow limits. Troas was anciently called Dardania. See **TROJA**.

TROCHEUS, in prosody, a foot consisting of a long and short syllable.

TROCHANTER, in anatomy. See **ANATOMY**.

TROCHE, in pharmacy, a sort of medicine made of glutinous substances into little cakes, and afterwards exsiccated. See **PHARMACY**.

TROCHILUS, **HUMMING BIRD**, a genus of birds belonging to the order of *picæ*. The rostrum is subulate, filiform, and longer than the head, the apex being tubular: the upper mandible sheaths the lower. The tongue is filiform and tubulous, the two threads coalescing; the feet are slender and fit for walking; the tail has ten feathers. There are 65 species, none of which are natives of Britain. They are all remarkable for the beauty of their colours, and most of them for the smallness of their size, though some are eight or nine inches in length.—They are divided into two families, viz. those with crooked bills, and those with straight bills. Of these we shall describe the four following species:

1. The *exilis*, or little humming-bird, has a crooked bill, is an inch and a half in length; frequently weighing less than 50 grains. The bill is black, and half an inch in length; the body greenish-brown, with a red, shining, inimitable gloss: the head is crested with a small tuft, green at bottom, but of a sparkling gold colour at top; quills and tail fine black. It is a native of Guiana; and the velocity of it in flying is so great, that the eye can scarce keep pace with its motion.

2. The *moschitus*, or ruby-necked humming-bird, according to Margrave is the most beautiful of the whole genus. Its length is three inches four lines; the bill straight, eight

lines long, and blackish: the top of the head and hind part of the neck are as bright as a ruby, and of the same colour: the upper parts of the body are brown, with a faint mixture of green and gold: the throat and fore part of the neck are the colour of the most brilliant topaz: the belly, sides, and thighs, are brown; but on the lower part of the belly, on each side, is a spot of white: the tail is rufous purple, inclining to violet at the ends; the two middle feathers are shortest: the legs and claws blackish. The female has only a dash of golden or topaz on the breast and fore part of the neck; the rest of the under parts are greyish white. This species is found in Brazil, Curassoa, Guiana, and Surinam.

3. The *minimus*, or least humming-bird, is exceeded, both in weight and dimensions, by several species of bees. The total length is one inch and a quarter; and when killed, weighs no more, according to Sir Hans Sloane, than 20 grains. The bill is straight and black, three lines and a half in length: the upper parts of the head and body are of a greenish gilded brown, in some lights appearing reddish: the under parts are greyish white; the wings are violet-brown; the tail of a bluish black, with a gloss of polished metal; but the outer feather, except one on each side, is grey from the middle to the tip, and the outer one wholly grey; legs and claws brown. The female is less than the male: the whole upper side of a dirty brown, with a slight gloss of green; the under parts of a dirty white. These birds are found in various parts of South America and the adjacent islands.—Our author received it from Jamaica.

4. *Superciliosus*, white shaft, or supercilious humming-bird, has a bill twenty lines long; the feathers of the tail next the two long shafts are also the longest, and the lateral ones continually decrease to the two outermost which are the shortest, and this gives the tail a pyramidal shape; its quills have a gold gloss on a grey and blackish ground, with a whitish edge at the point, and the two shafts are white through the whole projecting portions; all the upper side of the back and head gold colour; the wing violet-brown; and the under side of the body white-grey.

These birds subsist on the nectar or sweet juice of flowers: they frequent those most which have a long tube; particularly the *impatiens noli me tangere*, the *monarda* with crimson flowers, and those of the convolvulus tribe. They never settle on the flower during the action of extracting the juice, but flutter continually like bees, moving their wings very quick, and making a humming noise; whence their name. They are not very shy, suffering people to come within a foot or two of the place where they are, but on approaching nearer fly off like an arrow out of a bow. They often meet and fight for the right to a flower, and this all on the wing: in this state they often come into rooms where the windows stand open, fight a little, and go out again. When they come to a flower which is juiceless, or on the point of withering, they pluck it off as they were in anger, by which means the ground is often quite covered with them. When they fly against each other, they have, besides the humming, a sort of chirping noise like a sparrow or chicken. They do not feed on insects nor fruit: nor can they be kept long in cages, though they have been preserved alive for several weeks together by feeding them with water in which sugar had been dissolved.

This bird most frequently builds in the middle of a branch of a tree, and the nest is so small that it cannot be seen by a person who stands on the ground; any one therefore desirous of seeing it, must get up to the branch, that he may view it from above: it is for this reason that the nests are not more frequently found. The nest is of course very small, and quite round; the outside, for the most part, is composed of green

moths, common on old pales and trees; the inside of soft down, mostly collected from the leaves of the great mullein, or the silk grafs; but sometimes they vary the texture, making use of flax, hemp, hairs, and other soft materials: they lay two eggs of the size of a pea, which are white, and not bigger at one end than the other.

The above account of the manners will in general suit all the birds of this genus; for as their tongues are made for suction, it is by this method alone that they can gain nourishment: no wonder, therefore, they can scarcely be kept alive by human artifice. Captain Davies, however, informed our author, that he kept these birds alive for four months by the following method:—He made an exact imitation of some of the tubular flowers with paper, fastened round a tobacco-pipe, and painted them of a proper colour; these were placed in the order of nature, in the cage wherein these little creatures were confined; the bottoms of the tubes were filled with a mixture of brown sugar and water as often as emptied; and he had the pleasure of seeing them perform every action; for they soon grew familiar, and took the nourishment in the same manner as when ranging at large, though close under his eye.

TROGLODYTES, in the ancient geography, a people of Ethiopia, said to have lived in caves under ground. Pomponius Mela gives a strange account of the Troglodytes: he says, they did not so properly speak as murmur; and that they lived on serpents.

TROGUS, (Pompeius), Latin universal historian to the time of Augustus Cæsar, of whom we have only an abridgement by Justin, flourished about 41 B.C.

TROJA, the capital city of Troas, or, according to others, a country of which Ilium was the capital. It was built on a small eminence near mount Ida, and the promontory of Sigæum, at the distance of about four miles from the seashore. Dardanus the first king of the country built it, and called it *Dardania*, and from Tros one of his successors it was called *Troja*, and from Ilius *Ilium*. This city has been celebrated by the poems of Homer and Virgil; and of all the wars which have been carried on among the ancients, that of Troy is the most famous. A description of the plan of Troy has been lately published in French in the 3d volume of the Philosophical Transactions of the Royal Society of Edinburgh, written by M. Chevalier. The city of Troy, according to him, stood on the present site of the modern village of Bounarbachi, distant four leagues from the sea, and which is the residence of an Aga, ruling with absolute sway the inhabitants of the Trojan plain and the inferior Agas, to whom they are immediately subject. Bounarbachi is situated on the side of an eminence, exposed to every wind, at the termination of a spacious plain, the soil of which is rich and of a blackish colour. Close to the village is to be seen a marsh covered with tall reeds; and the situation is impregnable on all sides except at Erin (Homer's *pinos*), the *bill of wild fig trees*, which extended between the Scæan gate and the fountains of the Scamander. These circumstances, agreeing with Homer's descriptions, strongly support M. Chevalier's opinion concerning the situation of Troy. A very interesting part of this work is the account of conical mounds or barrows, several of them 100 feet in diameter at the base; and which the author maintains to be the identical tombs raised over the ashes of the heroes of the Trojan war; some of them he deems more ancient. He describes particularly the tombs of Eryetes, Ilius, Ajax, Hector, Achilles, Patroclus, and Antiochus. This dissertation, which runs to the length of 92 quarto pages, is replete with erudition and ingenious reasoning, and is illustrated and embellished by maps of the plan of Troy and several tables of inscriptions. It

has been translated with much accuracy and care by Mr. Dalzel professor of Greek in the University of Edinburgh, and accompanied with large notes and illustrations.

TROLLIUS, GLOBE-FLOWER, or *Luben Gowan*, in botany: a genus of plants belonging to the class of *polyandria*, and order of *polygynia*; and in the natural system ranging under the 26th order, *Mutisifluæ*. The calyx is wanting; there are about 14 petals; the capsules are very numerous, ovate, and monospermous. There are two species, the *asiaticus* and *europæus*; the latter of which is a British plant. The *europæus*, or European globe-flower, has its corollets connivent, and from 9 to 16 nectaria, of the length of the stamina, linear, plane, incurved, and perforated at the inside of the base. The leaves are divided first into five segments down to the base; the segments are again divided, each about half way, into two or three lobes, which are sharply indented on the edges. The stalk is a foot high, and scarcely branched; the flower is yellow, globose, and spacious. It grows at the foot of Mountains, and by the sides of rivulets. The country people in Sweden strew their floors and pavements on holidays with the flowers, which have a pleasant smell, and are ornamental in gardens.

TROMP (Martin Happertz Van), a celebrated Dutch admiral, was born at the Brille, in Holland. He raised himself by his merit, after having distinguished himself on many occasions, especially at the famous engagement near Gibraltar in 1607. He passed for one of the greatest seamen that had till that time appeared in the world; and was declared admiral of Holland, even by the advice of the prince of Orange. He in that character defeated a large Spanish fleet in 1630, and gained 32 other victories at sea; but was killed when under deck, in an engagement with the English in 1653. The states-general caused medals to be struck to his honour, and lamented him as one of the greatest heroes of their republic. Van Tromp, in the midst of the greatest glory, constantly discovered a remarkable modesty; for he never assumed a higher character than that of a burgher, and that of being the father of the sailors.

TRONAGE, an ancient customary duty or toll, for weighing of wool. According to Fleta, *trona* is a beam to weigh with, mentioned in the stat. Westm. 2. cap. 25. And trona was used for the weighing wool in a staple or public mart, by a common trona or beam; which, for the trona of wool in London, was fixed at Leaden-Hall. The mayor and commonalty of London are ordained keepers of the beams and weights for weighing merchants' commodities, with power to assign clerks and porters, &c. of the great beam and balance; which weighing of goods and wares is called *tronage*; and no stranger shall buy any goods in London before they are weighed at the king's beam, on pain of forfeiture.

TRONE-WRIGHT, the most ancient of the different weights used in Scotland; and, though now forbidden by several statutes, is still used by many for home-commodities, and that in a very irregular manner; for the pound varies in different places, and for different purposes, from 20 to 24 Dutch ounces. The common allowance is 2½ oz. for wool, 2½ for butter and cheese, 20 for tallow, lint, hemp, and hay. It is divided into 16 of its own ounces, and 16 pounds make a stone.

TROOP, a small body of horse or dragons, about 50 or 60, sometimes more, sometimes less, commanded by a captain, lieutenant, cornet, quarter-master, and three corporals, who are the lowest officers of a troop.

TROPE. See ORATORY.

TROPHONIUS CAVE, or *Oracle* (anc. geog.), a cave near Lebada in Bœotia, between Helicon and Charonea (Strabo): so called from Trophonius, an enthusiastic diviner; who, descending into this cave, pretended to give answers and pro-

nounce oracles; and was hence called *Jupiter Trophonius*. Such as went down to this cave never after smiled; hence the proverbial saying of a man who has lost his mirth, That he is come out of Trophonius's cave. Though Pausanias, who writes from experience, contradicts this; affirming that persons came out of the cave affected indeed with a stupor, but that they soon after recovered themselves. See ORACLE.

TROPHY (*Trophaean*), among the ancients, a monument of victory.

TROPIC-BIRD. See PHÆTON.

TROPHICS. See GEOGRAPHY.

TROUBADOURS, poets that flourished in Provence during the 12th century. They wrote poems on love and gallantry; on the illustrious characters and remarkable events of the times; satires which were chiefly directed against the clergy and monks; and a few didactic pieces. The troubadours were great favourites in different courts, diffused a taste for their language and for poetry over Europe, which was about that time sunk in ignorance and rudeness; they disappeared in the 14th century. A history of the troubadours, in 3 volumes 12mo, was begun by M. de Sainte Palaye, and finished by the Abbé Millot.

TROVER, in law, an action that a man hath against one that, having found any of his goods, refuseth to deliver them upon demand.

TROUT. See SALMO.

TROY. See TROJA.

TROY-WEIGHT, one of the most ancient of the different kinds used in Britain. The ounce of this weight was brought from Grand Cairo in Egypt, about the time of the crusades, into Europe, and first adopted in *Troyes* a city of Champagne; whence the name. The pound *English Troy* contains 12 ounces, or 5760 grains. It was formerly used for every purpose; and is still retained for weighing gold, silver, and jewels; for compounding medicines; for experiments in natural philosophy; and for comparing different weights with each other.

Scots Troy-Weight was established by James VI. in the year 1618, who enacted, that only one weight should be used in Scotland, viz. the French *Troy* stone of 16 pounds, and 16 ounces in the pound. The pound contains 7600 grains, and is equal to 17 oz. 6 dr. avoirdupois. The cwt. or 112 lb. avoirdupois, contains only 103 lb. 2½ oz. of this weight, though generally reckoned equal to 104 lb. This weight is nearly, if not exactly, the same as that of Paris and Amsterdam; and is generally known by the name of *Dutch weight*. Though prohibited by the articles of union, it is still used in weighing iron, hemp, flax, most Dutch and Baltic goods, meal, butcher-meat, unwrought pewter and lead, and some other articles.

TRUE-LOVE, in botany. See PARIS.

TRUFFLES. See LYCOPERDON.

TRUMPET, a musical instrument, the most noble of all portable ones of the wind kind; used chiefly in war, among the cavalry to direct them in the service. Each troop of cavalry has one. The cords of the trumpets are of crimson, mixed with the colours of the facings of the regiments. As to the invention of the trumpet, some Greek historians ascribe it to the Tyrrhenians; but others, with greater probability, to the Egyptians; from whom it might have been transmitted to the Israelites. The trumpet was not in use among the Greeks at the time of the Trojan war; though it was in common use in the time of Homer. According to Potter (*Arch. Græc.* vol. ii, cap. 9.), before the invention of trumpets, the first signals of battle in primitive wars were lighted torches; to these succeeded shells of fishes, which were sounded like trumpets. And when the trumpet became common in military use, it may well be imagined to have served at first only as a rough and noisy signal of battle, like that at present in Abyssinia and

New Zealand, and perhaps with only one sound. But, even when more notes were produced from it, it is noisy an instrument must have been an unfit accompaniment for the voice and poetry; so that it is probable the trumpet was the first solo instrument in use among the ancients.

TRUMPET, hearing, is an instrument invented by Joseph Landini, to assist the ear in hearing persons who speak at a great distance, without the assistance of any speaking-trumpet. Instruments of this kind are represented in Pl. 2. They are formed of tubes, with each wide mouths, terminating in a small canal, which is applied to the ear. The construction of these instruments evidently shews how they contribute to assist the hearing; for the weak and languid pulses of the air being received by the large end of the tube, and reflected several times from its sides in passing to the small end, are condensed, and entering the ear in this condensed state, strike the tympanum with a greater force than they could have done without the intervention of the tube. Hence it appears, that a *speaking-trumpet* may be applied to the purpose of a hearing-trumpet, by turning the wide end towards the sound, and putting the ear to the narrow end. Fig. 2. is an *ear-trumpet*, which answers the purpose in slighter cases of deafness, and may be conveniently carried in the pocket.

TRUMPET, speaking, is a tube from 6 to 15 feet long, made of tin, perfectly straight, and with a very large aperture; the mouth-piece being big enough to receive both lips. The mouth being applied to it, carries the voice to a very great distance, so that it may be heard distinctly a mile, or more; hence its use at sea. The invention of this trumpet is held to be modern, and is commonly ascribed to Sir Samuel Moreland. Of this instrument an account was published in 1671, in a work intitled *Tuba Stentoro-phonica*, wherein the author relates several experiments made by him with this instrument; the result of which was, that a *speaking-trumpet* constructed by him, 5 feet 6 inches long, 21 inches diameter at the greater end, and 2 inches at the smaller, being tried at Deal-castle, was heard at the distance of three miles, the wind blowing from the shore. But Ath. Kircher seems to have a better title to the invention; for it is certain he had such an instrument before ever Sir S. Moreland thought of his. Kircher, in his *Phonurgia Nova*, published in 1673, says, that the tromba, published last year in England, he invented twenty-four years before, and published in his *Musurgia*; he adds, that Jac. Albanus Ghibbini, and Fr. Eschinardus, ascribe it to him; and that G. Schottus testifies of him, that he had such an instrument in his chamber in the Roman college, with which he could call to, and receive answers from, the porter. Indeed, considering how famed Alexander the Great's tube was, wherewith he used to speak to his army, and which might be distinctly heard a hundred stadia or furlongs, it is somewhat strange the moderns should pretend to the invention; the stentorophonic horn, or tube of Alexander, whereof there is a figure preserved in the Vatican, being almost the same with that now in use. The principle upon which this instrument is constructed is obvious; for as sound is stronger in proportion to the density of the air, it must follow, that the voice passing through a tube or trumpet, must be greatly augmented by the constant reflection and agitation of the air through the length of the tube, by which it is condensed, and its action on the external air greatly increased at its exit from the tube. In order to estimate the effect of this instrument, let us suppose A B, Pl. 2. fig. 1. to be such a length of tube as admits one reflection of the sound, emitted by the speaker, from the side B B; let A F be another length, in which the sound or voice is reflected five times by the sides, viz. in B, C, D, E, and F: the sound striking the metal tube in B is the same as that at F; but the number of parts forming the pe-

riphery of the circle in B is to that in F, as the diameter B B is to the diameter F F; and therefore the intensities, with which the parts of the metal will be moved in these peripheries, will be in the inverse ratios of the peripheries, or of the diameters B B, F F. But the parts of the metal move the air contained within the peripheries of the circle, or constituting their respective areas, which are as the squares of the diameters: *i. e.* the air agitated in B is to that agitated in F, as B B² to F F²: and consequently, the intensity of the sound found in the tube of the length A B, is to that in the length A F, as B B² to F F²; and the inverse ratio of the diameter B to F: or, the intensity in A B is to that in A F: $FF \times BB : BB \times FF$, *i. e.* dividing the last ratio by B B $\times$ F F: $BB : FF$. But the intensity of the sound increases the more frequently it is reflected from the sides: let then the number of reflections of the sound in B be *n*, in F it will be *5n*, and therefore the whole intensity of the sound in B is to that in F as $n \times BB$ to $5n \times FF$. Consequently, the longer the tube the more numerous will be the reflections, and the greater will be the increase of the sound, and the farther may it be heard. A man, speaking through a tube 4 feet in length, may be understood at the distance of 500 geometrical paces; with a tube of 16 $\frac{1}{2}$ feet, at the distance of 1800 paces, and with a tube 24 feet long, at a greater distance than 2500 geometrical paces. The sound will be also heightened by having the remoter aperture of the tube wide, more than if it were narrow. However, the effect of the tube in magnifying sound, either for speaking or hearing, depends principally upon its length: nevertheless some advantage may be derived from its particular form and shape. Some have proposed the figure which is made by the revolution of a parabola about its axis, as the best; where the mouth-piece is placed in the focus of the parabola, and consequently the sonorous rays will be reflected parallel to the axis of the tube. But Mr. Martin observes, that this parallel reflection is by no means essential to the magnifying of sound; on the contrary, it prevents the infinite number of reflections and reciprocations of sound, in which, according to Sir I. Newton, its augmentation principally consists: the augmentation of the impetus of the pulses of air being proportional to the number of repercussions from the sides of the tube, and therefore to its length, and to such a figure as is most productive of them. Hence he infers, that the parabolic trumpet is the most unfit of any for this purpose. He observes, that there is one thing more which contributes to the augmentation of the agitations of air in the tube; viz. the proportion which the several portions of air bear to each other when divided by transverse sections, at very small, but equal distances, from one end of the tube to the other. Thus, let those several divisions be made at the points *a, b, c, d, e*, &c. (fig. 2.) in which let the right lines *n, k, b, l, c, m, d, n*, &c. be taken in geometrical proportion. Then will the portions of air contained between B and *a*, *a* and *b*, *b* and *c*, *c* and *d*, &c. be very nearly in the same proportion, as being in the same ratio with their bases, when the points of division are indefinitely near together. But it is known, that when any quantity of motion is communicated to a series of elastic bodies, it will receive the greatest augmentation when those bodies are in geometrical proportion. Therefore, since the force of the voice is impressed upon, and gradually propagated through a series of elastic portions of air in a geometrical ratio to each other, it easily receives the greatest augmentation possible. And since by construction $B = a = b = c = d$, &c. and $ak : bl :: bl : cm :: cm : d, n$, &c. the points *k, l, m, n, o, p, q, r, s*, A will form the *logarithmic* or *logistic* curve: whence Mr. Martin concludes, that a trumpet, formed by the revolution of this curve about its axis, will augment the sound in a greater degree than any other figured tube whatever. Cassegrain also is of opinion,

that an hyperbola, having the axis of the tube for an asymptote, is the best figure for this instrument. Mûschenb. *Int. ad Phil. Nat. tom. ii. p. 296, 4to.* Martin's *Phil. Brit. vol. ii. p. 248, 3d edit.*

For other constructions of speaking trumpets by Mr. Conyers, see *Phil. Trans. N° 141, for 1678.*

TRUMPET, Marine, is a musical instrument consisting of three tables, which form its triangular body. See pl. 2. It has a very long neck with one single firing, very thick, mounted on a bridge, which is firm on one side, but tremulous on the other. It is struck by a bow with one hand, and with the other the firing is pressed or stopped on the neck by the thumb. It is the trembling of the bridge, when struck, that makes it imitate the sound of a trumpet, which it does to that perfection, that it is scarce possible to distinguish the one from the other. And this is what has given it the denomination of trumpet-marine, though, in propriety, it be a kind of monochord. Of the six divisions marked on the neck of the instrument, the first makes a fifth with the open chord, the second an octave, and so on for the rest, corresponding with the intervals of the military trumpet.

TRUMPET-Flower. See **BIGNONIA**.

TRUMPETER. See **PSOPHIA**.

TRUNCATED, in general, is an appellation given to such things as have, or seem to have, their points cut off: thus, we say, a truncated cone, pyramid, leaf, &c.

TRUNCHEON, a short staff or baton used by kings, generals, and great officers, as a mark of their command.

TRUNDLE, a sort of carriage with low wheels, whereon heavy and cumbersome burdens are drawn.

TRUNK, among botanists, that part of the herb which arises immediately from the root, and is terminated by fructification; the leaves, buds, and auxiliary parts of the herb, not entering in its description.

TRUNNIONS, or **TRUNIONS**, of a piece of ordnance, are those knobs or bunches of metal which bear her up on the cheeks of the carriage.

TRUSS, a bundle, or certain quantity of hay, straw, &c. A truss of hay contains 56 pounds, or half an hundred weight: 36 trusses make a load.

TRUSS is also used for a sort of bandage or ligature made of steel, or the like matter, wherewith to keep up the parts in those who have hernias or ruptures.

TRUSS, in a ship, a machine employed to pull a yard home to its respective mast, and retain it firmly in that position.

TRUSTEE, one who has an estate, or money, put or trusted in his hands for the use of another.

TRUTH, a term used in opposition to falsehood, and applied to propositions which answer or accord to the nature and reality of the thing whereof something is affirmed or denied.

TRYPHODORUS, an ancient Greek poet, who lived some time between the reigns of Severus and Anastasius. His writings were very numerous; yet none of them have come down to us, except an epic poem, on which Mr. Addison has made some entertaining remarks in the Spectator, N° 63. The first edition of this extraordinary work was published by Aldus at Venice, with Quintus Calaber's paraliomena, and Coluthus's poem on the rape of Helen. It has been since reprinted at several places, particularly at Francfort in 1580 by Frischlinus; who not only corrected many corrupt passages, but added two Latin versions, one in verse and the other in prose. That in verse was reprinted in 1742, with the Greek, at Oxford, in 8vo, with an English translation in verse, and Notes, by Mr. Merrick.

TUAM, a town of Ireland, in the province of Connaught, and county of Galway, with an archbishop's see. It was once a famous city, though now it is reduced to a village; yet it

TRUMPET.

still retains the title of a city, as being an archiepiscopal see. It is seven miles from the borders of Mayo. W. Long. 8. 46. N. Lat. 53. 33.

TUB, in commerce, denotes an indetermined quantity or measure: thus a tub of tea contains about 60 pounds; and a tub of camphor from 56 to 86 pounds.

TUBE, in general, a pipe, conduit, or canal; a cylinder, hollow within-side, either of lead, iron, glass, wood, or other matter, for the air or some other matter to have a free conveyance through it.

Auricular TUBE, or instrument to facilitate hearing. See **TRUMPET**, hearing.

TUBERCLES, in medicine, little tumors which suppurate and discharge pus; and are often found in the lungs, especially of consumptive persons.

TUCUMÁN, a province of South America, in Paraguay; bounded on the north by the provinces of Los-Chicas and Chaco; on the east by Chaco and Rio-de-la-Plata, on the south by the country of Chichitos and Pampas, and on the west by the bishopric of St. Jago. The air is hot, and the earth sandy; however, some places are fruitful enough, and the original natives have a good character. The Spaniards possess a great part of this country.

TUFA, a stone consisting of volcanic ashes concreted together with various other species of stone. It is of various colours, blackish grey, bluish grey, and yellow; every colour having a different mixture and solidity: but all of them have the bad quality of mouldering down on long exposure to the weather; notwithstanding which, they have been used in buildings both ancient and modern. The yellow kind resists the air less than any other.

TULIP, **TULIP**, in botany: a genus of plants belonging to the class of *hexandria*, and order of *monogynia*; and in the natural system ranging under the 10th order *Coronaria*. The corolla is hexapetalous and campanulate, and there is no style. The species of this genus are four; the *lytcestris*, or Italian yellow tulip, a native of the south of Europe; the *gesneriana*, or common tulip, a native of the Levant; the *brey-niana*, or cape tulip, a native of the Cape of Good Hope; and the *biflora*.

1. The *lytcestris*, or wild European tulip, hath an oblong bulbous root, sending up long narrow spear-shaped leaves; and a slender stalk, supporting at top a small yellow flower, nodding on one side, having acute petals.

2. The *gesneriana*, Gesner's Turkey tulip of Cappadocia, or common garden-tulip, hath a large, oblong, tunicated, solid, bulbous root, covered with a brown skin, sending up long oval spear-shaped leaves; an upright round stalk, from half a foot to a yard high, garnished with a few leaves, and its top crowned with a large bell-shaped erect hexapetalous flower, of almost all colours and variegations in the different varieties.

This tulip, and its vast train of varieties, is the sort so generally cultivated for the ornament of our gardens, and so much admired by all for its great variety and beautiful appearance: it grows freely in the open ground in any common foil of a garden, and proves a very great decoration to the beds and borders of the pleasure ground for six weeks or two months in spring, by different plantings of early and late sorts; planting the principal part in autumn, and the rest towards Christmas, and in January or February. The autumn plantings will come earliest into bloom, and flower the strongest: and the others will succeed them in flowering. In summer, when the flowering is past, and the leaves and stalks assume a state of decay, the bulbs of the choicest varieties are generally taken up, the offsets separated, and the whole cleaned from filth; then put up to dry till October or November, and then planted again for the future year's bloom.

VOL. X.

Of this species, which is the florist's delight, the varieties may be divided into two principal classes, viz. 1. Early or dwarf spring tulips (*præcocæ*). 2. Late flowering tall tulips (*serotina*). 1. *Early tulips*. The early tulips are among florists distinguished by the appellation of *præcocæ* (early), because they flower early in the spring, a month or more before the others; are much shorter stalked, and the flowers smaller; but are in greater reputation for their early bloom and their gay lively colours, both of self-colours, and broken into flaked variegations; such as reds, crimson, scarlet, carnation, violets, purples, yellow, &c. with flowers of each, edged and flaked with red, yellow, and white, in many diversities. 2. *Late flowering common tulips*.—This class is denominated *late flowering*, and by the florists called *serotina*, because they blow later in the spring, a month or more, than the *præcocæ*, i. e. not coming into flower before the end of April, May, and June. They are all of tall growth, supporting large flowers, and furnish an almost endless variety in the vast diversity of colours, after they break from whole blowers into variegations and stripes, exceeding all others of the tulip kind in beauty and elegance of flower.

Both these species of tulips are hardy perennials, durable in root, or at least, although the old bulb decays annually, it perpetuates its species by off-sets, and is annual in leaf and stalk; which rising from the bulb early in the spring, arrives to a flowering state in April and May. All the varieties are succeeded by plenty of ripe seed in July and August, contained in an oblong capsule of three cells, having the seeds placed on each other in double rows. By the seeds many new varieties may be raised, which however will not attain a flowering state till they are seven or eight years old; and after that will require two or three years or more to break into variegations, when the approved varieties may be marked, and increased by off-sets of the root, as directed in their propagation.

The colours in greatest estimation in variegated tulips are the blacks, golden yellows, purple-violets, rose, and vermillion, each of which being variegated various ways; and such as are striped with three different colours distinct and unmixed, with strong regular streaks, but with little or no tinge of the breeder, may be called the most perfect tulips. It is rare to meet with a tulip possessing all these properties.

As to the manner of obtaining this wonderful variety of colours in tulips, it is often accomplished by nature alone, but is sometimes assisted and forwarded by some simple operations of art; such as that, in the first place, when the seedling bulbs of the whole flower or breeder are arrived to full size, and have flowered once, to transplant them into beds of any poor dry barren foil, in order that, by a defect of nutriment in the earth, the natural luxuriance of the plant may be checked, and cause a weakness in their general growth, whereby they generally in this weakened or infirm state gradually change and break out into variegations, some the first year, others not till the second or third; and according as they are thus broke, they should be planted in beds of good earth.

Another method to assist nature in effecting the marvellous work of breaking the breeding tulips into diversified colours, is to make as great a change as possible in the foil; if they were this year in a light poor foil, plant them the next in a rich garden mould, and another year in a compost of different earths and dung; or transplant them from one part of the garden to another, or into different gardens, &c. or from one country to another; all of which contributes in assisting nature in producing this desirable diversity of colours and variegations.

The double tulip is also a variety of the common tulip, and is very beautiful, though not in such estimation among the florists as the common single variegated sorts, not possessing such

a profusion of variegations in the colours and regularity of stripes: they however exhibit an elegantly ornamental appearance, as they rise with an upright, tallish, firm stem, crowned with a very large double flower composed of numerous petals, multiplied in several series one within another like a double peony, but far more beautiful in their diversity of colours, variegations, and stripes of white and red, yellow and red, &c. so that they highly deserve culture, both in beds alone near the other sorts to increase their variety, also to plant in patches, about the borders, in assemblage with the late variegated tulips, as they blow nearly about the same time, *i. e.* April and May.

Tulip roots are sold in full collection, consisting of numerous varieties, at most of the nurseries and seeds-men, who both propagate them themselves by off-sets and seed, and import vast quantities annually from Holland; the Dutch being famous for raising the grandest collections of the finest tulips, and other bulbous flowers, in the greatest perfection.

TULIP-Tree. See **LIRIODENDRON**.

TULL (Jethro), an Oxfordshire gentleman who farmed his own land, and introduced a new method of culture, to raise repeated crops of wheat from the same land without the necessity of manure: the principles of which he published about 30 years since, in *A Treatise on Horse-hoeing Husbandry*.

TUMBRELL, TUMBRELLUM, or Turbichetum, is an engine of punishment, which ought to be in every liberty that hath the view of frank-pledge, for the correction of idlers and inquiet women.

TUMEFACATION, the act of swelling or rising into a tumor.

TUMOR, in medicine and surgery, a preternatural rising or eminence in any part of the body.

TUMORS, in farriery. See **FARRIERY**.

TUN, a large vessel or cask, of an oblong form, biggest in the middle, and diminishing towards its two ends, gri about with hoops, and used for stowing several kinds of merchandise for convenience of carriage; as brandy, oil, sugar, skins, hats, &c.

TUN is also the name of a measure. A tun of wine is four hogheads; of timber, a square of 40 solid feet; and of coals, 20 cwt.

TUN, or Ton, is also a certain weight whereby the burden of ships, &c. are estimated.

TUNERIDGE, a town of Kent in England, situated on a branch of the river Medway, over which there is a bridge. It is a large well built place, noted for the mineral waters four or five miles south of the town. E. Long. o. 20. N. Lat. 51. 34.

TUNE. See **MUSIC** and **TONE**.

TUNGSTEN, or LAPIS PONDEROSUS; a genus of calcareous earth. It contains about one half its weight of calcareous earth, and the remainder iron, and a peculiar acid of an earthy appearance, now known by the name of the *tungsten acid*. When pure, it is of a grey colour and lamellated texture; its specific gravity being from 4.99 to 5.8.

TUNICA, a kind of waistcoat or under garment, in use among the Romans. They wore it within doors by itself, and abroad under the gown. The common people could not afford the toga, and so went in their tunics; whence Horace calls them *populus tunicatus*.

TUNICA, in anatomy, is applied to the membranes which invest the vessels, and divers others of the less solid parts of the body; thus the intestines are formed of five tunics or coats.

TUNIS, a large and celebrated town of Africa, in Barbary, and capital of a kingdom of the same name. It is seated on the point of the Gulph of Goletta, about eight miles from the

place where the city of Carthage stood. It is in the form of a long square, and is about four miles in circumference, with ten large streets, five gates, and thirty-five mosques. The houses are all built with stone, though but one story high; but the walls are very lofty, and flanked with several strong towers. It has neither ditches nor bastions, but a good citadel, built on an eminence on the west side of the city. It is said to contain 300,000 inhabitants, of whom 30,000 are Jews. The divan, or council of state, assembles in an old palace; and the dey is the chief of the republic, who resides there. The harbour of Tunis has a very narrow entrance, through a small canal. In the city they have no water but what is kept in cisterns, except one well kept for the bathaw's use. It is a place of great trade, and is ten miles from the sea. E. Long. 10. 16. N. Lat. 36. 42.

TUNIS, a country of Africa, bounded on the north and east by the Mediterranean Sea and the kingdom of Tripoli, on the south by several tribes of the Arabs, and on the west by the kingdom of Algiers and the country of Elab; being 300 miles in length from east to west, and 250 in breadth from north to south. This country was formerly a monarchy; but a difference arising between a king and his son, one of whom was for the protection of the Christians, and the other for that of the Turks, in 1574 the inhabitants shook off the yoke of both. From this time it became a republic under the protection of the Turks, and pays a certain tribute to the bathaw who resides at Tunis. The air in general is healthy; but the soil in the eastern parts is indifferent for want of water. Towards the middle the mountains and valleys abound in fruits; but the western part is the most fertile, because it is watered with rivers. The environs of Tunis are very dry, upon which account corn is generally dear. The inroads of the Arabs oblige the inhabitants to sow their barley and rye in the suburbs, and to inclose their gardens with walls. However, there are plenty of citrons, lemons, oranges, dates, grapes, and other fruits. There are also olive-trees, roses, and odoriferous plants. In the woods and mountains there are lions, wild bees, ostriches, monkeys, camels, roebucks, hares, pheasants, partridges, and other sorts of birds and beasts. The most remarkable rivers are the Guadilcarbar, Magrida, Magerada, and Caps. The form of government is aristocratic; that is, by a council, whose president is the dey, not unlike the doge of Venice. The members of the divan or council are chosen by the dey, and he in his turn is elected by the divan; which is composed of soldiers, who have more than once taken off the dey's head. The bathaw is a Turk; residing at Tunis; whose business is to receive the tribute, and protect the republic: the common revenues are only 400,000 crowns a-year, because the people are very poor; nor can they feed above 40,000 men into the field; nor more than twelve men-of-war of the line to sea, even upon the most extraordinary occasions. There are generally about 12,000 Christian slaves in this country; and the inhabitants carry on a great trade in linen and woollen cloth. In the city of Tunis alone there are above 3000 clothiers and weavers. They also have a trade in horfes, olives, oil, soap, ostriches eggs and feathers. The Mahometans of this city have nine colleges for students, and eighty-six petty schools. The principal religion is Mahometanism; but the inhabitants consist of Moors, Turks, Arabs, Jews, and Christian slaves. However, the Turks, though fewest in number, domineer over the Moors, and treat them little better than slaves.

TUNKERS, a religious sect of baptists in Pennsylvania, so called from the word *tunker*, to put a morsel in sauce. They are also called *tumblers*, because in performing baptism they plunge the person into the water with the head first. As the Germans found the letters *t* and *d* like *d* and *p*, the

words *tunkers* and *tumblers*, have been sometimes written *dunkers* and *dumplers*. Their church-government and discipline are the same with those of the English baptists, except that every brother is allowed to speak in the congregation, and the best speaker is usually ordained to be their minister. They are a harmless, well-meaning people.

TUNNAGE. See **TONNAGE**.

TUNNY, in ichthyology. See **SCOMBER**.

TUNNY-FISHING. See **FISHERY**.

TURBAN, the head-dress of most of the eastern nations. It consists of two parts, a cap and sash of fine linen or taffety, artfully wound in divers plaits about the cap. The cap has no brim, is pretty flat, though roundish at top, and quilted with cotton; but does not cover the ears. There is a good deal of art in giving the turban a fine air; and the making of them is a particular trade. The sash of the Turk's turban is white linen; that of the Persian's red woollen. These are the distinguishing marks of their different religions. Sophi king of Persia, being of the sect of Ali, was the first who assumed the red colour, to distinguish himself from the Turks, who are of the sect of Omar, and whom the Persians esteem heretics.

TURBINATED, is a term applied by naturalists to shells which are spiral or wreathed conically, from a larger basis to a kind of apex.

TUREITH-MINERAL, a preparation of quicksilver, called in the new dispensatory of the London College *hydrargyrum vitriolatus*; and in that of Edinburgh, *mercurius flavus*.

TURBO, the **WREATH**, in zoology, a genus of insects belonging to the order of *vermes testacea*. The animal is of the snail kind; the shell consists of one spiral solid valve, and the aperture is orbicular. There are 116 species; of which the most remarkable are, 1. The *litoreus*, or periwinkle. This is abundant on moist rocks far above low-water mark. The Swedish peasants believe, that when these shells creep high up the rocks, they indicate a storm from the south. They are eaten by the poor people in moist parts of this kingdom. Young lobsters are said to take up their lodging in the empty shells of these animals, which has given occasion to a notion that periwinkles are changed into lobsters. 2. The *clatrus*, or barbed wreath, has a taper shell of eight spires, distinguished by elevated divisions running from the aperture to the apex. There is a variety pellicid, with very thin edges. It is analogous to that curious and expensive shell, the *scutella-trap*.

TURBOT, in ichthyology. See **PLEURONECTES**.

TURCÆ, or **TURCI** (Mela); supposed to be the *Turci* of Ptolemy; whom he places between Caucasus and the Montes Ceraunii. The name is said to denote, "to desolate, or lay waste." Herodotus places them among the wild or barbarous nations of the north. There is a very rapid river called *Turk*, running into the Caspian Sea, from which some suppose the Turks to take their name. They made no figure in the world till towards the 7th century; about the beginning of which they sallied forth from the Portæ Caspiæ, laid waste Persia, and joined the Romans against Chosroes king of Persia. In 1042 they subdued the Persians, in whose pay they served, and from whom they derived the Mahometan religion; and afterwards pouring forth, over-ran Syria, Cappadocia, and the other countries of the Hither Asia, under distinct heads or princes, whom Ottoman subduing, united the whole power in himself, which to this day continues in his family, and who fixed his seat of empire at Prusa in Bithynia. His successors subdued all Greece, and at length took Constantinople in 1453; which put a period to the Roman empire in the East, under Constantine the last emperor. It is a standing tradition or prophecy among the Turks, that their empire will at

length be overturned by the Franks or Christians; which seems now to be drawing on apace towards accomplishment.

TURCOISE. See **TURQUOISE**.

TURCOMANIA, a province of Asiatic Turkey, answering to the ancient kingdom of Armenia.

TURDUS, the thrush: a genus of birds belonging to the order of *passeres*. The bill is straightish, bending towards the point, and slightly notched near the end of the upper mandible. The nostrils are oval, naked or half covered with a membrane; the corners of the mouth are furnished with a few slender hairs, and the tongue is slightly jagged at the end. There are 136 species; of which seven are British, the *vici-vorus*, *pilaris*, *iliacus*, *muscus*, *rofeus*, *merula*, and *torquatus*.

1. The *vici-vorus*, or mistle, is the largest of the genus. Its length is 11 inches; its breadth 16½. The bill is shorter and thicker than that of other thrushes; dusky, except the base of the lower mandible, which is yellow. The irides are hazel. Head, back, and lesser coverts of the wings, are of a deep olive brown. The lower part of the back is tinged with yellow. The lowest order of lesser coverts, and the great coverts, are brown; the first tipped with white, the last both tipped and edged with the same colour. The inner coverts of the wings white. The tail is brown; the three outermost feathers tipped with white. The cheeks and throat are mottled with brown and white; the breast and belly are whitish yellow, marked with large spots of black; the legs are yellow. These birds build their nests in bushes, or on the side of some tree, generally an ash, and lay four or five eggs: their note of anger or fear is very harsh, between a chatter and shriek; from whence some of its English names. Its song, however, is very fine; which it begins sitting on the summit of a high tree, very early in the spring, often with the new-year, in blowing showery weather, which makes the inhabitants of Hampshire to call it the *storm-cock*. It feeds on insects, holly and mistletoe-berries, which are the food of all the thrush kind: in severe snowy weather, when there is a failure of their usual diet, they are observed to scratch out of the banks of hedges the root of arum, or the cuckoo pint; this is remarkably warm and pungent, and a provision suitable to the season.

2. The *pilaris*, or fieldfare, is in length ten inches, in breadth seventeen. The head is ash-coloured inclining to olive, and spotted with black; the back and greater coverts of the wings of a fine deep chestnut; the tail is black; the lower parts of the two middlemost feathers, and the interior upper sides of the outmost feathers, excepted, the first being ash-coloured, the latter white. The legs are black; the talons very strong. This bird passes the summer in the northern parts of Europe; also in Lower Austria. It breeds in the largest trees; feeds on berries of all kinds, and is very fond of those of the juniper. Fieldfares visit our islands in great flocks about Michaelmas, and leave us the latter end of February or the beginning of March.

These birds and the redwings were the *turdi* of the Romans, which they fattened with crumbs of figs and bread mixed together. Varro informs us that they were birds of passage, coming in autumn, and departing in the spring. They must have been taken in great numbers; for, according to Varro (lib. 3. c. 5.) they were kept by thousands together in their fattening aviaries. They do not arrive in France till the beginning of December.

3. The *muscus*, or throistle, is in length nine inches, in breadth 13½. In colour, it so nearly resembles the mistle-thrush, that no other remark need to be added, but that it is less, and that the inner coverts of the wings are yellow. The throistle is the finest of our singing birds, not only for the sweetness and variety of its notes, but for the long continu-

ance of its harmony; for it obliges us with its song for near three parts of the year. Like the mistle-bird, it delivers its music from the top of some high tree; but to form its nest defends to some low bush or thicket: the nest is made of earth, moss, and straw, and the inside is curiously plastered with clay. It lays five or six eggs, of a pale bluish green, marked with dusky spots.

4. The *iliacus*, or redwing, has a very near resemblance to the thrush; but is less: their colours are much the same; only the sides under the wings and the inner coverts in this are of a reddish orange, in the thrush yellow; above each eye is a line of yellowish white, beginning at the bill and passing towards the hind part of the head. These birds appear in Great Britain a few days before the fieldfare; they come in vast flocks, and from the same countries as the latter. With us they have only a disagreeable piping note; but in Sweden, during the spring, they sing very finely, perching on the top of some tree among the forests of maples. They build their nests in hedges, and lay six bluish-green eggs spotted with black.

5. The *merula*, or black-bird, when it has attained its full age, is of a fine deep black, and the bill of a bright yellow; the edges of the eyelids yellow. When young, the bill is dusky, and the plumage of a rusty black, so that they are not to be distinguished from the females; but at the age of one year they attain their proper colour. This bird is of a very retired and solitary nature; frequents hedges and thickets; in which it builds earlier than any other bird: the nest is formed of moss, dead grass, fibres, &c. lined and plastered with clay, and that again covered with hay or small straw. It lays four or five eggs of a bluish-green colour, marked with irregular dusky spots. The note of the male is extremely fine, but too loud for any place except the woods: it begins to sing early in the spring, continues its music part of the summer, desists in the moulting season, but resumes it for some time in September and the first winter months.

6. The *torquatus*, or ring-ouzel, is superior in size to the black-bird; the length is eleven inches, breadth seventeen. The bill in some is wholly black, in others the upper half is yellow; on each side the mouth are a few bristles; the head and whole upper part of the body are dusky, edged with pale brown; the quill-feathers and the tail are black. The coverts of the wings, the upper part of the breast, and the belly, are dusky, slightly edged with ash-colour. The middle of the breast is adorned with a white crescent, the horns of which point to the hind part of the neck. It some birds this is of a pure white, in others of a dirty hue. In the females and in young birds this mark is wanting, which gave occasion to some naturalists to form two species of them. The ring-ouzel inhabits the Highland hills, the north of England, and the mountains of Wales. They are also found to breed in Dartmoor, in Devonshire, and in banks on the sides of streams. The places of their retreat are not known. In Scotland and Wales they breed in the hills, but descend to the lower parts to feed on the berries of the mountain-ash. They migrate in France at the latter season; and appear in small flocks about Monthard in Burgundy, in the beginning of October, but seldom stay above two or three weeks.

To these we shall add the description of the *polyglottus*, or mocking thrush, which is a native of America. It is about the size of a thrush, of a white and grey colour, and a reddish bill. It is possessed not only of its own natural notes, which are musical and solemn, but it can assume the tone of every other animal in the wood, from the wolf to the raven. It seems even to sport itself in leading them astray. It will at one time allure the lesser birds with the call of their males,

and then terrify them when they have come near with the screams of the eagle. There is no bird in the forest but it can mimic; and there is none that it has not at times deceived by its call. But, unlike such as we usually see famed for mimicking with us, and who have no particular merit of their own, the mock bird is ever sure to please when it is most itself. At those times it usually frequents the houles of the American planters; and sitting all night on the chimney top, pours forth the sweetest and the most various notes of any bird whatever. It would seem, if accounts be true, that the deficiency of most other song-birds in that country is made up by this bird alone. They often build their nests in the fruit-trees about houses, feed upon berries and other fruits, and are easily rendered domestic.

TURENNE (Viscount). See TOUR.

TURF, peat, a blackish earth used in several parts of England, Holland, and Flanders, as fuel. Turf, as distinguished from peat, consists of mould interwoven with the roots of vegetables; when those roots are of the bulbous kind, or in a large proportion, they form the looser and worse kind of turf; but when mixed with a considerable proportion of peat, they form what is called *stone-turf*; it at first hardens, but at last crumbles by long exposure to the air.

TURGESCENCE, among physicians, denotes a swelling or growing bloated.

TURGOT (Anne Robert James), the famous financier, was born at Paris, May 10, 1727, of a very ancient Norman family. His father was for a long time provost of the corporation of merchants. During this period he was the object of general admiration; and the regularity and economy of his administration procured him the particular respect of the citizens. M. Turgot was the youngest of three brothers. The eldest was intended for the rank of magistracy, which had been the station of his family for several generations; the second was destined for the army; and Robert for the church. He had scarcely attained the age at which reflection commences, when he resolved to sacrifice all temporal advantages to liberty and conscience, and to pursue his ecclesiastical studies without declaring his repugnance to their proposed object. At the age of twenty-three years he took his degree, and was elected prior of the Sorbonne.

The time when it was necessary for him to declare that he would not be an ecclesiastic was now arrived. He announced this resolution to his father by letter, showing the motives which induced him to decline the clerical order. His father consented, and he was appointed master of requests. M. Turgot prepared himself for this office by particular application to those parts of science which are most connected with its functions and duties, viz. the study of natural philosophy, as far as it relates to agriculture and manufactures, to the subjects of merchandize, and the execution of public works, together with such parts of mathematical knowledge as lead to a practical application of natural philosophy, and facilitate the calculations that are frequently necessary in politics, commerce, and law.

About this period he wrote some articles for the *Encyclopédie*, of which the most capital were, *Etymology*, *Existence*, *Expansibility*, *Fair*, and *Foundation*. He had prepared several others, but these five only were inserted; the persecution set on foot against the *Encyclopédie* hindered him from continuing to write in it, being unwilling that his opinions should be published in a work which was received with disapprobation by some of the most distinguished people of that time.

In 1761 M. Turgot was appointed intendant of Limoges. In this office he did much good. He gave activity to the society of agriculture established at Limoges, by directing them

efforts to important objects : he opened a mode of public instruction for female professors of midwifery ; he procured for the people the attendance of able physicians during the raging of epidemic diseases : he established houses of industry, supported by charity (the only species of alms-giving which does not encourage idleness) : he introduced the cultivation of potatoes into his province, &c. &c. While M. Turgot proceeded with unremitting activity and zeal, in promoting the good of the people over whom he was placed, he mediated projects of a more extensive nature, such as an equal distribution of the taxes, the construction of the roads, the regulation of the militia, the prevention of a scarcity of provision, and the protection of commerce.

At the death of Louis XV. the public voice called M. Turgot to the first offices of government, as a man who united the experience resulting from habits of business to all the improvement which study can procure. After being at the head of the marine department only a short time, he was, August 24, 1774, appointed comptroller-general of the finances. During his discharge of this important office, the operations he carried on are astonishing. He suppressed twenty-three kinds of duties on necessary occupations, useful contracts, or merited compensations. He abolished the *corvée* for the highways, saving the nation thirty millions of livres annually.—He set aside another kind of *corvée*, which respected the carriage of military stores and baggage.—He abated the rigour in the administration of indirect impositions, to the great profit of the contributors, the king, and the financiers.—He softened the mode of collecting the territorial imposts.—He stopped the progress of a plague among cattle.—He suppressed a sedition conducted with art.—He provided for the equal distribution of subsistence.—He gave the utmost encouragement to the cultivation of the three chief productions of France, viz. wheat, cattle, and wine, and to the commerce thence resulting.—He reformed a number of abuses, some of which yielded a profit to the place he filled.—He abolished as much as he could the sale of offices.—He formed many useful establishments.—He paid the pensions of the poorer servants of the state, who were four years in arrear.—He supplied the expences of a coronation, the marriage of a prince, and the birth of a prince.—He facilitated payments as far as India.—He settled a part of the colony debts, and put the rest in order.—He found the public borrowing at five and a half per cent. and reduced the rate to four.—He lessened the public engagements 84 millions.—He found the revenue 19 millions deficient, and left a surplus of three millions and a half.—All these he accomplished within the space of twenty months, during seven of which severe fits of the gout totally incapacitated him for business.

At length, however, by the artifices of the courtiers, his office was taken from him ; but when removed to a private station, M. Turgot did not experience that frightful void which is the just but dreadful punishment of ambitious men when deserted by fortune. The sciences and the belles-lettres, which he had cultivated in his youth, afforded him consolation, while an active sphere of life was denied him. Natural philosophy and chemistry were his favourite pursuits ; yet he frequently entertained himself with poetry, especially with translating Virgil into French verse. " We know," says the Marquis de Condorcet, " but of one Latin verse composed by M. Turgot, and which was intended for a picture of Dr. Franklin, *Eripuit calo fulmen, mox sequestra tyranni.*"

The attacks of the gout, under which he had long laboured, becoming more frequent and excessive, forewarned him of the approaching moment, when, in conformity to the laws of nature, he was going to fill, in a higher order of beings, the

rank which these laws destined for him. He died March 20, 1781.

For a more ample account of this illustrious statesman, we refer the reader to the History of his Life, written by the Marquis de Condorcet.

TURIN, a city of Italy, and capital of Piedmont, situated at the conflux of the Po and the Grand Doria, about seven miles from the foot of the Cottian Alps, in the road from France to Italy, by the way of Mount Cenis : according to Pliny, the inhabitants derive their origin from the Ligurians, and were anciently called *Taurini*. Hannibal, the Carthaginian general, when he invaded Italy, took and destroyed the town, because the inhabitants would not take part with him ; which frightened the other people who inhabited the banks of the Po. It was erected into a Roman colony by Julius Cæsar, who gave it the name of *Julia*, and was called *Augusta Taurinorum* by his successor Augustus. It was successively subjected to the Goths, Huns, Eruli, and Burgundians, who ruined and destroyed it, but it was soon rebuilt, though not so large as before. When the Lombards became masters of the country, it became the capital of one of their principal duchies. Some of the dukes became kings of Italy. Such was Agilolph, or Acon, who, with his wife Theodelinga, built the cathedral consecrated to John the Baptist, which is at present the metropolitan, and endowed it with great revenues. After Charlemagne had abolished the kingdom of the Lombards, it appears that Turin became subject to the marquis of Susa, who had the charge of guarding the passages of the Alps, and continued in that family to the death of Uric Manfred, the last marquis of Susa, in 1302 ; whose daughter, Adelaide, married with Odo, comte de Maurienne and Savoy. Turin submitted to him and to his descendants, who have possessed it with little interruption to this time. Turin is the see of an archbishop, and contains 110 churches or chapels, several hospitals, and about 65,000 inhabitants. The approach to it is magnificent, and the environs beautiful, though thick fogs from the two rivers are frequent in autumn and winter ; so that the air of Turin is then very thick and moist. The four gates are highly ornamental ; the streets in the New Town are wide, straight, clean, having plenty of water running through them, well built, in a good taste, chiefly of brick stuccoed, and generally terminating in some agreeable object. No inhabitant can rebuild or repair his house but on an uniform plan, laid down by government, for the improvement of the city. The fortifications of Turin are regular, and kept in excellent repair. The citadel is a regular pentagon, consisting of five strong bastions, and is reputed one of the strongest in Europe. At the end next the new gate is the arsenal, which, besides the armories found in such places, contains a cabinet of minerals, a good chemical laboratory, a library of books in mineralogy and metallurgy, and furnaces for casting cannon : here, also, are mathematical, mechanical, and other masters, for the instruction of engineers, miners, &c. The garrison of Turin is always changed at the end of two years, and then there is a general review. The university was founded first in the year 1405, and consists of schools, wherein twenty-four professors read lectures, from the 3d of November to the 24th of June ; of the royal library, wherein are about 50,000 volumes of printed books, besides manuscripts : this is open every day, except holidays, both morning and afternoon. The royal museum has a good cabinet of medals, and a collection of antiquities, found chiefly in Piedmont or Sardinia, and elegantly arranged : also of natural history, as shells, and English minerals, polished marbles, and hard stones, petrifications, corals, zoophytes, and some minerals, collected by Donati, in the Adriatic ; also, some chests of natural curiosities, which

Donati, during his travels in Egypt and Arabia, sent from Goa. In the military academy, young gentlemen, both natives and strangers, may be instructed in the exercises at a moderate expence, the king defraying a part of the charge attending this institution. The king's palace is in a simple and noble style of architecture. The apartments are handsomely fitted up and furnished: the ceilings painted by Daniele di Santerre and others. They contain a great collection of pictures, among which are many good ones. The king's theatre, or great opera-house, is reckoned one of the finest in Europe. The buildings which are most esteemed in point of architecture, are, the palace of the duke of Savoy, called Castello Reale, by Filippo Giuvana; the Carignano palace, by Guarini; the buildings of the university, and the town-house. There is a literary society at Turin, who have published memoirs, under the title of *Miscellanea Philologica-Mathematica*. The chief trade of this city and country is in thrown silk, which is sent to England and Lyons; they manufacture, however, some of it into excellent stockings, and good silk for furniture. In the year 1536, Turin was taken by the French, and again in the year 1640, after a long siege. In the year 1706, the same enemy made another attempt, but after besieging it upwards of three months, under the conduct of the duke of Orleans, they were driven away, with great loss, by the duke of Savoy and prince Eugene. Long. 25. 19. E. Ferro. Lat. 44. 52. N.

TURKEY, in ornithology. See MELEAGRIS.

TURKEY, one of those great sovereignties which includes many countries and provinces, in Europe, Asia, and Africa, extending from Long. 16. to 66. E. Ferro, reckoning from the western part of Algiers, which is tributary to Baisora, on the Gulf of Persia, and from Lat. 13. to 45. N. including Arabia, and the provinces on the coasts of the Black Sea, from Aden to Otchakov. In Europe, may be reckoned, Romelia, which comprehends Greece, Macedonia, Albania, the Morea, and Thessaly, with the islands of the Archipelago or the Egean Sea; part of Slavonia, Croatia, Servia, Bosnia, Bulgaria, &c. In Asiatic Turkey are comprehended, Natolia, Caramania, Syria, Turcomania, Diarbekir, and the three Arabias, Felix, Petraea, and Deserta. In Africa, the countries subject to the Turks are, Barca and Egypt, and great part of Nubia. The states of Algiers, Tunis, and Tripoly, are under their protection: so likewise are the princes of Moldavia and Walachia; and the republic of Ragusa pays them a tribute. The whole is divided into twenty-five governments, of which two are under the care of beglerbegs, viz. Natolia and Romelia; the rest under pachas or bashas: 1. Egypt, or Cairo. 2. Aleppo. 3. Diarbekir. 4. Natolia. 5. Bosnia. 6. Buda, now belonging to Hungary. 7. Caffa (now Theodosia, and belonging to Russia). 8. Caramania, or Cogni. 9. Cars. 10. Candia. 11. Cyprus. 12. Damafcus. 13. Van. 14. Marasch. 15. Mosul. 16. That of the Captain Pacha. 17. Rica. 18. Romelia. 19. Sivas. 20. Scheheresul. 21. Bagdad. 22. Erzerum. 23. Temeisvar, now subject to Austria. 24. Tripoly. 25. Tripoly, in Syria. Happily situated in the centre of our continent, the Turks might easily acquire the trade, as well as the empire of the world, if not withheld by their indolence and their maxims of government. But though the Turks are no traders, being rather discouragers and destroyers of trade; yet, as they possess so great a part of the world, and some of the most fruitful countries, and productive of the best and choicest merchandizes, it will always induce the European parts of the world to send their merchants to traffic with them; and the Turks themselves, by their haughtiness, despising manufacturing, and not improving the products which they enjoy in many places, must necessarily be obliged to purchase of other nations the things they stand

in need of; which naturally encourages the merchants of the other nations to come among them. Those that settle among them from the Eastern part of the world, are generally Greeks, Jews, Armenians, and Georgians; those from the western parts are chiefly Venetians, French, and Dutch, with some Jews also, chiefly Italian. The principal places of trade on this side the Turkish dominions, respecting Europe, where the said merchants reside, are Constantinople, Smyrna, Aleppo, Alexandretta or Scanderoon, Alexandria, Tripoli, Antioch, and the islands on the coast. There are some Christian merchants in most of the islands belonging to the Turks, as at Cyprus, Candia, Rhodes, Zant, Cephalonia, and in most of the inhabited islands of the Archipelago. These merchants are generally French, though there are some Jews. The merchants of England, France, and Holland, chiefly furnish the Turks with fine woollen clothes, dyed scarlet, crimson, purple, blue, and green; the first three in grain, and as rich in colour as possible, which raises their value. The English, besides their cloth, send black-tin, lead, clock-work, and watch-work, both in gold and silver; and all put together, the value was formerly for upwards of 300,000. sterling, one year with another. The returns which the Franks (for so the European merchants are called in Turkey) make from the Turks, and which are the product of the Turkish and Persian dominions, are, raw silk, Caramania wool and wool of the islands, goats-hair, spun or twisted cotton wool, and yarn, oil, gums dragant, sandarac, fenega, arabic, farcocolla; Persian silks, carpets, burdets, callicoes, from the islands of Siphanto, Paros, &c. Morocco leather, cordovans, shagreen-skins, Galls, from Syria; coffee, from Mocha; by Alexandria, balm, natural balsam, rhubarb; from Persia, sal-ammoniac, turmeric, incense, pumices; from Santorini, storax; from Samos, scammony, myrrh, manna, galbanum, fena, aloes hepatica, oilibanum, zedoary, okre, emery, soaked earth, velani, coliquintida, euphorbium, mirabolans, frank-incense, mastic, opium, and other articles. Arrac, orange-flower-water, vermicelli, turpentine, worm-feed, clover-feed, garden-seeds, rice, pistachios, raisins of Smyrna, pomegranates, box and cypress wood, fustic, ebony, walnut-tree, &c. As the Turks have little or no trade but what is, as it were, forced by the Europeans and others, so they have but few ships, compared to the extent of their naval dominions. The chief of their shipping is among the Grecian islands, and these are such as belong to the Greeks. Also in the Morea, and in the Black Sea, they have some shipping; but, for the traffic between Egypt and the Porte, they generally hire English, Dutch, or Venetian ships, upon freight. The produce of the islands is exceedingly great, and assists the Turks in making returns for the goods they buy of the European merchants. From what has been said of the trade to Turkey, a judgment may be formed of its importance; but notwithstanding this, the English trade has for some years been greatly on the decline. The air of Turkey in Europe is healthy in itself, but the pestilence is often brought there, and has more than once swept away the fifth of the inhabitants of Constantinople; yet by the prevalence of custom, and of the Turkish doctrine of fatality, they give themselves no great concern about it. The provinces are universally fruitful, though with some difference; vast quantities of all kinds of excellent grain and fruits being exported every year. The number of its inhabitants is greatly disproportionate to the extent and goodness of the country, which may be chiefly attributed to pestilence, polygamy, and war. This accounts for such large tracts of fine soil lying waste. The Turks are stigmatized among the Christians as a slothful, stupid, and inhuman people; but they are by no means so wicked and dreadful a set of creatures as some writers have represented them. Turkey is not without

men of parts, probity, and honour; nor benevolent, liberal, temperate, conversible, and ingenious people. In short, there is here, as in all other countries and nations, a mixture of good and bad. Dricelich says, that, in compassion and love towards our neighbours, the Turks excel all the rest of mankind; and this assertion is confirmed by several other travellers. One striking mark of their charity, are the public inns, by the Asiatics called *Caravanferi*, which are to be met with almost in every little village. In these a traveller, of whatever religion or country he be, may continue three days gratis; and in not a few he is found also in victuals. The Turks are generally robust and well-shaped, of a good mien, and patient of hardships, which renders them fit for war, to which indeed they inure themselves from their youth. Persons of rank seldom train up their children to any thing else, out of a notion that no glory is comparable to that acquired in war. In their dress, manner of living, and customs, they are particular. They shave their heads, but wear long beards, of which they are extremely careful, except those in the seraglio, and military men, who wear only whiskers. The turban, or Turkish band, worn by the men, is white, and consists of long pieces of thin linen made up together in several folds. No one but a Turk must presume to wear a white turban. Their clothes are long and full. They sit, eat, and sleep, agreeably to the custom of the Orientals, on the floor, on cushions (*sophas*), mattresses, and carpets. Rice is their most general food, and coffee their usual drink, wine being interdicted. They expend great sums on fountains, and no country indeed affords so fine; and those not only in the towns, but in the country, and other solitary places, for the refreshment of travellers and labourers. Their most usual salutation is to bow the head a little, laying the right hand on their breast; but to persons of rank they stoop so low as to touch and kiss the border of their vest. In war time, the left hand is the place of honour among military men, but in time of peace this distinction ceases among the officers of state and relations. The fair sex here are kept under a rigorous confinement. The Arabic word *Haram*, which signifies a sacred or prohibited thing, is in its fullest sense, used both of the women's habitation, and of the women themselves. The seraglies are improperly termed *harams*, the word *seraglio* signifying no more than a palace. The nobility among the Turks are the chief military officers, judges, and ecclesiastics. The Turkish commonalty enjoy the greatest liberty; and to the orders of the Porte, which must be answered with the head, those only are exposed who hold considerable posts; or, as the phrase is in Turkey, "eat the sultan's bread." The Greeks, who are the ancient inhabitants of the country, live intermixed with the Turks, and in several places, particularly the islands, out-number them. In Constantinople alone it is computed there are no less than 400,000. They are accustomed to servitude, and prefer living under the Turkish exactions, to the spiritual tyranny of the pope: but they must be very cautious of not giving the least colour for suspicion of holding correspondence with the enemies of the Ottoman porte, or of meditating a sedition; in case also of a war with any of the Christian powers, it is usual, for the greater security, to disarm them. All Greeks, from the age of fourteen, pay annually, at the beginning of the Turkish feast of *Beiram*, a head money, in value about a ducat, and receive a note of it. The ecclesiastics are assessed higher: a deacon paying two ducats, and an archimandrite four; but the bishops, archbishops, and patriarchs, pay large sums, generally as much as the arbitrary avarice of the grand vizir and *bashas* shall think proper to require. The duties on traders are estimated to the value and price of the commodities they import. The Turks every-where lay hold of all opportunities of extorting money from the Greeks, but especially

from their clergy: in return for this tribute, they enjoy the protection of the Ottoman porte, and are maintained in the quiet possession of their properties; inasmuch that no Turk is to insult them, take any thing from them, or intrude themselves into their houses, against their will; and in case of any such injuries, they are certain of expeditious justice against the delinquents. The Greek women are exempt from all taxes, as are likewise great numbers of other Greeks, who serve in the navy, or elsewhere. It sometimes happens indeed, that a Greek girl, of distinguished beauty, is taken away, and carried to the seraglio; but Christian children are not in general forced away from their parents to be brought up in Mahometanism: and when any thing of that kind is done, it must be in the provinces which are at a distance from Constantinople. The Turks are of the Mahometan religion, and appropriate to themselves the name of *Moslemim*, which has been strangely corrupted into *Myslemian*, signifying persons professing the doctrine of Mahomet, which he calls *Islam*. Drinking wine is manifestly prohibited in the Koran, yet the Turks make use of it occasionally, without any scruple, though instead of it, they generally use sherbet, a liquor made of honey, spices, and the juice of fruits. Polygamy is indeed permitted, but the Koran enjoins that no man shall have more than four wives and concubines; and to exceed that number, is the particular privilege of the prophet and his successors; divorces are also allowed of, but no one may take back again the wife he has once repudiated, till she has been married to another, and afterwards divorced with him. Friday is the day set apart for divine worship. The churches of the Turks are called *mosches*, and the smaller ones *mesches*. The chief ecclesiastic is the mufti, which signifies an expounder of the law, and his office is of such dignity, that when he comes to court, the emperor himself rises from his seat, and advances seven steps to meet him. He alone has the honour of kissing the sultan's left shoulder; whereas the grand vizir, with a more profound inclination of body, kisses only the edge of the emperor's vest, who advances only three steps to meet him. By the law, the mufti is to be consulted on all emergencies, in those more particularly relating to peace and war. As the mufti of the Turks may be compared to the pope; so a *cadaliksir*, who is also a secular person, is not unlike a patriarch; a *mola* is an archbishop; a *cadie* is also a layman, may be accounted a bishop; and an *iman* a priest. The chief employment of the latter is praying. The Turks have also their convents and monks, under the general name of *dervises*. The head of the Greek church in Turkey in Europe, is the patriarch of Constantinople, who is chosen by the neighbouring archbishops and metropolitans, and confirmed by the emperor, or grand vizir; he is a person of great dignity, being the principal of the Greek patriarchs, and head and director of the Eastern church. His income amounts to no less than 120,000 guilders, of which he pays the one-half, by way of annual tribute, to the Ottoman porte, adding 6000 guilders besides, by way of present, at the feast of *Beiram*. Subordinate to him are seventy archbishops and metropolitans, and a much greater number of bishops. An archimandrite is the director of one or more convents, which are called *mandren*, and rank above an abbot, of which each convent has one. The monks, priests and students excepted, are obliged to follow some handicraft, and lead an austere life. The most celebrated are those of Mount Athos. The Greeks have but few nunneries at present. The secular clergy are subject to no rules, as the regulars are, who perform divine worship. They are allowed to marry, but that only before ordination, and then only once, and that with a virgin. These secular ecclesiastics never rise higher than an archpriest; the bishops, metropolitans, archbishops, and patriarchs, being

chosen from among the monks. The Armenians, the Roman-catholics, and Jews, have also the free exercise of their religion, and the Swedes have been permitted to build a Lutheran church at Constantinople. The Turks are not without all kinds of learning, having some schools, colleges, and academies. And, in this century, a Turkish printing office was set up, at Constantinople, by Ibrahim Effendi, who, after great opposition, obtained leave to print all kinds of books, except on matters of religion; accordingly, among others, he published some maps and books of history and geography. The Turks are of Tartarian, or Scythian extraction, this appellation being first given them in the middle ages, as a proper name, it being a general title of honour to all the nations comprehended under the two principal branches of Tartar and Mogul, and therefore never used as a proper name of any Scythian or Tartarian people; nor do even the Turks appropriate it peculiarly to themselves; the word Tur, as an adjective, signifying sublime and pre-eminent, and, as an appellation, a governor. Turci, therefore, may import both the governor of a hord (ki, among the Tartars, signifying a hord or company) as well as the hord itself. The Scythian or Tartarian nation, to which the name of Turks has been particularly given, dwell betwixt the Black and Caspian Seas; and became first known in the seventh century, when Heraclius, emperor of the East, took them into his service, under whom they so distinguished themselves, by their fidelity and bravery, in the conquest of Persia, that the Arabian and Saracen caliphs, not only had particular bodies of them for guards, but their armies were likewise filled with them. Thus they gradually got the power into their hands, and set up and dethroned caliphs at pleasure. Some governors also of this nation, have wholly revolted from the dominions of the caliphs. This happened about the ninth century. By this strict union of the Turks with the Saracens or Arabs, the former were brought to embrace the Mahometan religion; so that they are now become intermixed, and have jointly enlarged their conquests. The Turks, however, were superior, and subdued the Saracens. Jenghis Khan, or Zengis Chan, at the head of the Oguzinian hord, issued out of great Tartary, and made himself master of a great tract of land, near the Caspian Sea, and even of all Persia and Asia the Lesser. Incited by his example and success, Schah Soliman, prince of the town of Nera, on the Caspian Sea, in the year 1214, passed Mount Caucasus, with 50,000 men; he made his way through Aderbeitsan, or Media, as far as the borders of Syria; and though stopped there in his career, by the Jenghizian Tartars, yet, in the year 1219, he penetrated a second time into Asia the Lesser, as far as the Euphrates. The report of his conquests reaching the court of Persia, Soliman and his people were spoken of as Turks, a name common to all the Scythians, who came out of Tartary, under the command of Jenghis Khan. Othman, his grandson, made himself master of several countries and places in Lesser Asia, belonging to the Grecian empire; and having, in the year 1300, at the city of Karahissar, taken upon him the title of emperor of the Ottomans, called his people after his own name. His residence was fixed at Eskihehr, and, exclusive of many other towns, in the year 1326, he took Prusa, in Bithynia, now called *Bursa*, which his son and successor, Orchan, made the seat of his empire. Orchan sent his two sons, Solymán and Amurath, on an expedition into Europe; the former of whom reduced the city of Gallipoli, and the latter took Tynros. Amurath succeeding his father in the government, in the year 1360, conquered Anlyra, Adrianople, and Philippopolis. In the year 1362 he instituted the janizaries, over-run Servia and fell upon Macedonia and Albania. His son and successor, Bajazet, was successful both in Europe and Asia, defeating the Christians, near Nicopolis; but, in the year 1401, he himself was routed and taken

prisoner, by Tamerlane. His sons disagreed, but Mahomet I. held the sovereignty, and his son Amurath II. distinguished himself by several important enterprises; and, particularly, in the year 1444, gained a signal victory over the Hungarians, near Varna. Mahomet II. and the greatest of all the emperors, in the year 1453, made himself master of Constantinople, reducing the whole Grecian empire under his dominion. He subdued twelve kingdoms and 200 towns. Bajazet II. and Selim I. enlarged the Turkish empire in Europe, Asia, and Africa. Soliman I. is not more famous for his victories over the Hungarians, than for his body of laws. The succeeding emperors were not so fortunate: Mahomet IV. in the year 1669, subdued Candia; and in 1683, laid siege to Vienna, but in Hungary met ill success. In the reigns of Soliman II. Achmet II. and Mustapha, the Hungarians and Venetians were so successful against the Turks, that Mustapha II. in the year 1699, was glad to come to a peace at Karlowitz. Achmet III. in 1718, concluded the treaty of Passarowitz, and Mahomet V. by the peace of Belgrade, in the year 1739, reannexed Servia, a part of Walachia, and Choczim, to the empire. In the succession to the empire, no regard is paid to age or birthright, the Turks thinking it sufficient, if, in their elections, they keep to the Ottoman family. Women are excluded from the throne. The government is indeed purely monarchical; but, if the emperor indulges not the humours of the people, and especially of the mutinous janizaries, he is not only in danger of being deposed, but also of being put to death. The emperor's council of state is styled *galibé Divan*, or *Divan galibé*, and meets twice a-week in the emperor's palace, namely, on Sundays and Thursdays. The grand vizir sits as president, having the cadiliskar of Romelia at his right hand, and that of Natolia at his left. The musli also assists, when expressly summoned. All the others, lubbe vizirs, have likewise a seat here, and next to them stand on one side the tefterdar, or high treasurer, the reis-effendi, secretary of state, and other commissioners of the calem, or exchequer; but the military officers, such as the aga of the janizaries, the aga of the ipahis, the aga of the siluks, &c. fit within the divan. The sultan hears what passes from an adjoining chamber, which looks into the divan. When the sultan convenes a general council, to which are summoned all the great persons of the empire, the clergy, the military, and other officers, and even the old and experienced soldiers; such a divan is called *Ajak Divani*; the whole assembly standing. The highest officer, and next to the emperor, is the grand vizir, whose income, without any breach of probity, may amount to six hundred thousand dollars a-year, exclusive of presents and other perquisites. The high court of justice is held in a large hall of the grand vizir's palace, called *Divan-chane*. The grand vizir being president, is obliged four times a-week, namely, on Friday, Saturday, Monday, and Wednesday, to sit in the divan, and administer justice to the people; unless, which seldom happens, he be hindered by affairs of a very important nature. At Beglerbeg is a viceroi, with several provinces under his command; the name itself signifying a prince of princes; under these are the bashaws or governors, whose posts are very considerable but precarious; and subordinate again to these are the fangiaks, who may be termed deputy governors. The janizaries, properly jenghithier, a word compounded of *jengi* new, and *isçeri* a soldier, are the flower of the Turkish land forces; they are all infantry, and were first formed out of captive Christians by the emperor Amurath the First: their number is generally forty thousand, divided into one hundred and sixty-two companies, or chambers, called *Odaz*, in which they live together at Constantinople, as in a convent; the recruits are termed *yamagi*; the capis are also infantry; the ipahis, light-horse; and the timar, ipahi, or the old and preferred ipahis, instead of

pay, have villages in several of the provinces, and are obliged, according to their income, to bring at least three slaves with them into the field. The foot, under the command of a bathaw, are still called by the ancient name of *Segban*, and the horie *Seraje*. The tributary princes, as the princes of Moldavia and Walachia, are obliged also to send auxiliaries. The whole Turkish army makes above three hundred thousand men. The janizaries and spahi have their aga, or general. A *seraskier*, or commander in chief of the whole army, must be a bathaw of two or three horie-tails: these horie-tails are the insignia of grandeur in Turkey, and carried before the great men. It is only the principal bathaws, and other persons of the highest distinction, who are allowed three. The beglerbegs and fangiacs have also their several commands. The Turkish navy is laid up at Constantinople near the arsenal, and consists of about forty large ships; but in time of war, when the fleet is to be put to sea, the Turks receive auxiliary ships from Algiers, Tunis, and Tripoli: they buy up also or hire merchants' ships, and those rise a fleet of one hundred and fifty sail, exclusive of galleys of two, three, and four banks of oars: the admiral is styled capudan or capitan-bathaw.

TURNERIC, in botany. See *CURCUMA*.

TURNEBUS (Adrian), an eminent French critic, was born in 1512. His true name was Turnbull. He was the son of a Scotchman, an officer in the Scotch troop of guards, who married a Norman lady. The son, who is the subject of this article, changed his name into Turneboeuf; but this name giving occasion for puns, he varied it to Turnebe, in Latin Turnebus. He acquired so extensive a reputation by his learning, that he had great offers made him from Italy, Germany, and England; but we are told he preferred poverty in his own country to riches in any other. He taught polite literature first at Toulouse; but in 1547 went to be Greek professor at Paris, whither his name drew scholars to him from all parts of Europe: in 1552, he took upon him the care of the royal Greek press for three years, when he quitted it on being admitted into the number of royal professors. He died in 1565; and his works, which are all in Latin, were printed at Strasbourg, in one volume folio, 1600. His *Adversaria*, three volumes folio, had been printed at Paris before.

TURNER, in botany, a species of *BRASSICA*. For the culture of them, see *HUSBANDRY*.

TURNER-Bread. See *BREAD*.

TURNER-Fly. See *CHRYSMALA*.

TURNING, the art of forming hard bodies, as wood, ivory, iron, into a round or oval shape by means of a machine called a *lathe*. This art was well known to the ancients, and seems to have been carried by them to a very great degree of perfection; at least, if we believe the testimony of Pliny and several other authors, who tell us, that those precious vases enriched with figures in *half-relief*, which still adorn our cabinets, were turned on the lathe.

The art of turning is of considerable importance, as it contributes essentially to the perfection of many other arts. The architect uses it for many ornaments, both within and without highly finished houses. The mathematician, the astronomer, and the natural philosopher, have recourse to it, not only to embellish their instruments, but also to give them the necessary dimension and precision. In short, it is an art absolutely necessary to the goldsmith, the watchmaker, the joiner, the smith.

Turning is performed by the lathe, of which there are various kinds, and several instruments, as gonges, chisels, drills, formers, screw tales, used for cutting what is to be turned into its proper form as the lathe turns round. One of the most simple kinds of lathe is represented in Plate 2. fig. 1. in which *a* is the footstock, *b* the cord, *c* the frame of the lathe, *d* & *e* the puppets, *e* the points, *f* the spangning tree.

The lathe should be fixed in a place very well lighted; it should be immovable, and neither too high nor too low. The puppets should neither be so low as to oblige the workman to stoop in order to see his work properly, nor so high that the little chips, which he is continually driving off, should come into his eyes.

The piece to be turned should be rounded (if it be wood) before it be put on the lathe, either with a small hatchet made for the purpose, or with a plane, or with a file, fixing it in a vice, and flaying it down till it is every-where almost of an equal thickness, and leaving it a little bigger than it is intended to be when finished off. Before putting it on the lathe, it is also necessary to find the centres of its two end surfaces, and that they should be exactly opposite to each other; that when the points of the puppets are applied to them, and the piece is turned round, no side may belly out more than another. To find these two centres, lay the piece of wood to be turned upon a plank; open a pair of compasses to almost half the thickness of the piece; fix one of the legs in the plank, and let the point of the other touch one of the ends of the piece, brought into the same plane with the plank on which the compasses is fixed, and very near the fixed leg. Describe four arches on that end at equal distances from each other, at the circumference of the end, but intersecting one another within; the point of intersection is the centre of the end. In the same manner must the centre of the other end be found. After finding the two centres, make a small hole at each of them, into which insert the points of the puppets, and fix the piece so firmly as not to be shaken out, and yet loose enough to turn round without difficulty.

The piece being thus fixed, it is necessary in the next place to adjust the cord, by making it pass twice round the piece, and in such a manner, that the two ends of the cord, both that which is fixed to the *spang* and to the *foot-board*, come off on the side on which the turner stands, that the piece may move against the edge of the cutting-tool and be turned. If the lathe be moved by a wheel, the manner of adjusting the cord needs no directions.

If the workman does not choose to be at the trouble to find the two centres of the piece in the manner described above, let him lay, as nearly as he can, the centre of one end upon the point of the left hand puppet, and then let him push forward the right hand puppet, striking it with a mallet till its point is as near as he can in the centre of the other end of piece; and then fixing the right hand puppet by a gentle blow of the mallet on the key, let him turn round the piece to see by the eye if the centres have been properly found. If any part of it bellies out, let him strike that part gently with the mallet till it goes properly; then let him strike one of the puppets pretty smartly to drive the points into the piece, and afterwards fix the puppet by striking the key. If the workman cannot judge by the eye whether the piece be turning properly round its centres or not, he should apply gently the point of an instrument called a *triangular graver*, leaning it on the *rest*, and it will mark by a line the place where the piece is out of its centre; and by striking upon this line with a mallet, the piece can easily be placed properly. The *rest*, of which we have just spoken, ought to be placed upon the two arms of the lathe, and fixed with screws as near the piece as the workman pleases.

The piece being fixed between the two points of the puppets, the cord adjusted, and the *rest* fixed as near the work as possible without touching it; the workman is now to take a *gauge* (fig. 2. in which *a* is the mouth and *b* the handle) of a proper size in his left hand, and hold it by the handle a little inclined, keeping the back of the hand lowermost. With his right hand, the back of which is to be turned upwards, he is to grasp it as near the end as possible on this side of the *rest*.

then leaning the gouge on the *refl*, he is to present the edge of it a little higher than the horizontal diameter of the piece, so as to form a kind of tangent to its circumference; then putting the right foot on the foot-board, and turning round the wheel, and holding the gouge firmly on the *refl*, the piece will be cut neatly. In the same manner are the chisels, formers, and other instruments, to be used, taking care that the wood be cut equally, and that the instrument be not pushed improperly, sometimes stronger than at others; and taking care also that the instrument used do not follow the work, but that it be kept firmly in the hand without yielding.

The young turner ought to endeavour to acquire the management of the gouge and the chisel, which are the instruments by far the most frequently used, and the most necessary in this art: by them, almost entirely, are the soft woods turned; for as for hard woods and other things, as box, ebony, horn, ivory, and the metals, they are hardly ever turned except by *shaving off*. In that case gravers are to be used with square, round, or triangular mouths (fig. 3, 4, 5). They should be held horizontally while applied to the wood, and not obliquely as directed for the gouge and the chisel.

After the work is completely turned, it is next to be polished; and this cannot be done with the instruments hitherto mentioned. Soft woods, as pear-tree, hazel, maple, ought to be polished with shark-skin or Dutch rushes. There are different species of sharks; some of which have a greyish, others a reddish skin. Shark-skin is always the better to be a good deal used; at first it is too rough for polishing. The *Dutch-rush* is the *equisetum hyemale* of Linnaeus, which grows in moist places among mountains, and is a native of Scotland; it has a naked, simple, round stem, about the thickness of a writing pen. The oldest plants are the best. Before using them they should be moistened a little, otherwise they break in pieces almost immediately, and render it exceedingly difficult to polish with them. They are particularly proper for smoothing the hard woods, as box, lignum vitae, ebony, &c. After having cleaned up the piece well, it should be rubbed gently either with wax or olive-oil, then wiped clean and rubbed with its own raspings or with a cloth a little worn. Ivory, horn, silver, and brads, are polished with pumice-stone finely pounded and put upon leather or a linen cloth a little moistened: with this the piece is rubbed as it turns round in the lathe; and to prevent any dirt from adhering to any part of it, every now and then it is rubbed gently with a small brush dipt in water. To polish very finely, the workmen make use of tripoli, a particular kind of earth, and afterwards of putty or calx of tin. Iron and steel are polished with very fine powder of emery; this is mixed with oil, and put between two pieces of very tender wood, and then the iron is rubbed with it. Tin and silver are polished with a barnisher and that kind of red stone called in France *sanguine d'ore*. They may be polished also with putty, putting it dry into flammey-skin, or with the palm of the hand.

To succeed in turning iron, it is necessary to have a *lathe* exceedingly strong in all its parts, and exceedingly well fixed. The puppets should be short, and the *refl* well fixed very near the work: the back of the *refl* should be two or three lines lower than the iron to be turned.

The lathe and other instruments being prepared, it is necessary to determine the length and thickness of the iron to be turned according to the design which is to be executed, and to make a model of it in wood a little thicker than it ought to be: then, one exactly like this is to be forged of the best iron that can be procured; that is to say, it must not be new, but well prepared and well beaten with hammers; it must have no flaws, nor cracks, nor pimples. New iron, which has not been well beaten, often contains round drops of cast

iron, called by the workmen *grains*, which blunt the edges of the gouges, chisels, and other instruments used for cutting; break them, or make them slide. The iron being forged according to the model, it should be annealed, that is, heated red hot and allowed to cool slowly on the coals till the fire go out of itself. Some people, to soften the iron, cover it over with clay and allow it to cool. The iron cylinder being thus made, it is next to be put upon the lathe, finding the centres as formerly directed, and boring a small hole in them that the iron may not escape from the points.

The points should be oiled from time to time to prevent their being excessively heated and spoiled while the iron is turning. A *crotchet* is then to be applied to the iron to be turned, a little above its centre, pretty gently, and by this means the inequalities of the cylinder will be taken off. Other instruments are then to be applied to mould the iron according to the model; and whenever any of them grow hot, they are to be plunged into a basin of water lying beside the workman. If the iron, after being properly turned, is to be bored like a gun-barrel, one of the puppets is to be removed, and another substituted in its place, having a square hole through it, into which the collar of the iron is to be fixed firmly, so as not to shake; then borers are to be applied, like those which locksmiths use to bore keys; and beginning with a small one, and afterwards taking larger ones, the hole is to be made as wide and deep as necessary; great care must be taken to hold the borers firm on the *refl*, otherwise there is danger of not boring the hole straight. The borer must be withdrawn from time to time to oil it and to clean the hole. Since it is difficult to make a hole quite round with borers alone, it is necessary to have also an instrument a good deal smaller than the hole, one of the sides of which is sharp, very well tempered, and a little hollow in the middle. This instrument being fixed in a pretty long handle, is to be applied with steadiness to the inner surface of the hole, and it will entirely remove every inequality that may have been there before its application.

For turning ovals, a lathe of somewhat a different construction is used. The axis or spindle, having on it the pulley over which the band-cord passes for turning the lathe, is fixed between the two puppets so as to turn round easily; one end of it passes through one of the puppets, and to it is firmly fixed a circular plate of brass, so that it turns round along with the spindle. Upon this plate two brazen segments of circles are fastened, the circumferences of which correspond to the circumference of the plate: their chords are parallel, and equally distant from the centre of the plate, so that they leave a distance between them. They have a groove in each of them: in these grooves another plate is placed, which exactly fills up the space between the two grooves, but is shorter than the diameter of the larger circular plate on which it is laid. This plate is made to slide in the grooves. To its centre is fixed a short spindle, on which the piece of wood to be turned is fixed. When the lathe is set a-going, the circular plate moves round, and carries the piece along with it; the plate of brass on which the piece is fixed being fixed loosely in the grooves already described, slides down a little every time that the grooves become perpendicular to the floor (and there are particular contrivances to prevent it from sliding down too far); and by these two motions combined, the circular one of the large plate, and the straight one of the small, the circumference of the piece of wood to be turned necessarily describes an oval; and gouges or other tools being applied in the usual manner supported on the *refl*, it is cut into an oval accordingly. The small plate may be made to slide either more or less in the grooves; and by this contrivance the transverse diameter of the oval, or rather ellipse, may be made longer or shorter at pleasure. Another, and still simpler method, if pos-

fible, of turning ovals, is this : take two ovals of metal, exactly of the size of the oval which you intend to make ; fix them, firmly on the spindle of the lathe so as to turn round with it : fix between them the wood to be turned ; and then it is easy, by the help of chisels and other tools, to cut it, as the lathe goes into exactly the figure of the external ovals. Or an oval may be formed by placing the wood, or whatever is to receive that shape, obliquely on the lathe. There are several other ingenious methods of turning ; but our bounds do not permit us to enter upon them. We shall therefore conclude this article with a number of receipts, which every turner ought to know.

1. *The method of moulding boxes both of shell and horn.*—In the first place, form a proper mould, which must consist of two pieces, viz. of a circle about half an inch thick, which should slope a little in order to draw out the moulded shell the more easily ; and a ring fitted to the outside of the circle, so that both together make the shape of a box. These two pieces being adjusted, it is necessary to round the shell to be moulded of such a size, that, when moulded, it will be a little higher than the ring of the mould, that there may be no deficiency. The mould is then to be put into a press on a plate of iron, exactly under the screw of the press ; put then the shell upon the circle of the mould, so that its centre also is exactly opposite to the screw of the press : then take a piece of wood formed into a truncated cone, and not so thick as the diameter of the circle of the mould, nor so deep as the ring : then put a plate of iron above the cone, and screw down the press gently and cautiously till the whole is well fixed : then plunge the whole into a cauldron of boiling water placed above a fire. In eight or ten minutes the shell or horn will begin to soften ; screw the press a little firmer that the wooden cone may sink into the softened shell : repeat this from time to time till the cone is quite sunk in the mould ; then take out the press and plunge it into cold water. When it is cold, take the box now formed out of the mould, and put into the inside of it a new mould of tin exactly of the form you wish the inside of the box to be ; do the same with the outside, put it again into the press, and plunge it into boiling water ; screw the press gradually till the box be fashioned as you desire.

2. *Method of preparing green wood so that it will not split in the turning.*—Having cut your wood into pieces of a proper size, put it into a vessel full of a ley made with wood ashes. Boil it there about an hour ; then, taking the cauldron off the fire, allow the ley to cool ; then take out the wood and dry it in the shade.

3. *Method of giving an ebony-black to hard and fine woods.*—After forming the wood into the destined figure, rub it with aqua fortis a little diluted. Small threads of wood will rise in the drying, which you will rub off with pumice-stone. Repeat this process again, and then rub the wood with the following composition : Put into a glazed earthen vessel a pint of strong vinegar, two ounces of fine iron filings, and half a pound of pounded galls, and allow them to infuse for three or four hours on hot cinders. At the end of this time augment the fire, and pour into the vessel four ounces of copperas (sulphat of iron), and a chopin of water having half an ounce of bonax and as much indigo dissolved in it ; and make the whole boil till a froth rises. Rub several layers of this upon your wood ; and, when it is dry, polish it with leather, on which you have put a little tripoli.

4. *Method of giving to plum-tree the colour of brazil wood.*—Slack lime with urine, and deaub, the wood over with it while it is hot : allow it to dry ; then take off the coat of lime, and rub it with chamois skin well oiled. Or, steep your wood in water, having a quantity of alum dissolved in it : then, having allowed brazil wood to dissolve in water five or

six hours, steep your wood in it, kept luke-warm during a night ; and when it is dry, rub it, as before directed, with chamois skin well oiled.

5. *Method of giving a fine black colour to wood.*—Steep your wood for two or three days in luke-warm water in which a little alum has been dissolved ; then put a handful of logwood, cut small, into a pint of water, and boil it down to less than half a pint. If you then add a little indigo, the colour will be more beautiful. Spread a layer of this liquor quite hot on your wood with a pencil, which will give it a violet colour. When it is dry, spread on another layer ; dry it again, and give it a third : then boil verdigris at discretion in its own vinegar, and spread a layer of it on your wood : when it is dry, rub it with a brush, and then with oiled chamois skin. This gives a fine black, and imitates perfectly the colour of ebony.

6. *Method of cleaning and whitening bones before using them.*—Having taken off with a saw the useless ends of the bones, make a strong ley of ashes and quick-lime, and into a pailful of this ley put four ounces of alum, and boil the bones in it for an hour ; then take the vessel containing the ley off the fire and let it cool ; then take out the bones and dry them in the shade.

7. *Method of folding shells.*—Clean the two sides of the shells which you wish to join together ; then, having joined them, wrap them up in linen folded double and well moistened ; then heat two plates of iron pretty hot, that they may keep their heat for some time ; and putting your shells rolled up between them under a press, which you must screw very tight, leave them there till the whole is cold, and they will be folded. If you do not succeed the first time, repeat the process.

8. *Method of moulding shells.*—Put six pints of water into a kettle ; add to it an ounce of olive or other oil ; make the water boil ; then put in your shell, and it will grow soft. Take it out, and put it into a mould under a press, and it will take the figure you want. This must be done quickly ; for if the shell cool ever so little, the process will fail. It will not require much pressure.

9. *Method of tinging bones and ivory red.*—Boil shavings of scarlet in water. When it begins to boil, throw in a quarter of a pound of ashes made from the dregs of wine, which will extract the colour : then throw in a little rock alum to clear it, and pass the water through a linen cloth. Steep your ivory or bone in aqua fortis, and put it into the water. If you wish to leave white spots, cover the places destined for them with wax.

10. *To tinge ivory black.*—Steep the ivory during five or six days in water of galls with ashes made with dried dregs of wine and arsenic ; then give it two or three layers of the same black with which plum-tree is blackened, in order to imitate ebony. Or, dissolve silver in aqua fortis, and put into it a little rose water. Rub the ivory with this, and allow it to dry in the sun.

11. *Method of hardening wood to make pulleys.*—After finishing the pulley, boil it seven or eight minutes in olive oil, and it will become as hard as copper.

12. *To make Chinese varnish.*—Take of gum-lac in grains four ounces ; put it into a strong bottle with a pound of good spirit of wine, and add about the bulk of a hazel-nut of camphor : Allow them to mix in summer in the sun, or in winter on hot embers for twenty-four hours, shaking the bottle from time to time. Pass the whole through a fine cloth, and throw away what remains upon it. Then let it settle for twenty-four hours, and you will find a clear part in the upper part of the bottle, which you must separate gently and put into another vial, and the remains will serve for the first layers.

TURNSTONE, in ornithology. See *TALPOX*.

TURPENTINE, a transparent viscid substance, flowing either naturally or by incision from several unctuous or resinous trees; as the terebinthus, pine, larch, fir, &c. See **Pinus**.

Oil of TURPENTINE. An essential oil, procured from turpentine by distillation. It is of great use in the arts and in medicine.

TURPETH, the cortical part of the root of a species of convolvulus, brought from the East Indies. It is accounted a pretty strong cathartic; but it is very uncertain in its strength, for sometimes a dose from a scruple to a dram purges violently, while at other times a much greater dose produces very little effect.

TURQUOISE, is the tooth of an animal penetrated with the blue calx of copper: it loses its colour when heated; it is opaque, and of a lamellar texture, and susceptible of a fine polish; its specific gravity is from 2,5 to 2,908; some are of a deep blue, some of a whitish blue, but become of a deeper when heated. This substance is found in Persia and Languedoc. The copper may be extracted from it by distilled vinegar. According to Reamur (*Mem. Par.* 1715) nitrous acid will not dissolve that of Persia, though it will that of France, which shows a difference between them.

TURRETIN (Francis), minister and professor of divinity at Geneva, his native place, was born in 1623. Having studied at Geneva, Leyden, Saumur, Montauban, and Nismes, with great success, he was admitted into the ministry in 1648, and served at the same time the French and Italian churches at Geneva. Two years after, he was offered the professorship of philosophy, which he refused; but accepted the invitation of the church of Lyons. He was recalled to Geneva at a year's expiration, because he was wanted to give lectures in divinity; which he began in 1653. He was sent to Holland in 1661, to procure money which the city of Geneva had occasion for. He had in that journey all the success he could promise himself; and gained such a character there, that he was strongly importuned by the Walloon churches at the Hague and at Leyden to enter into their service. On his return he resumed the functions of his place, and continued there till his death with remarkable application. He died in 1687, with the character of a man of great merit; eloquent, judicious, laborious, learned, and zealous for orthodoxy. His works were published by his son John Alphonius, in 3 and in 4 vols. 4to.

TURMIS, **TOWER-MUSTARD**, in botany: a genus of plants belonging to the class of *tetradynamia*, and to the order of *siliculosæ*; and in the natural system ranging under the 39th order, *Siliculosæ*. The silicle is very long and angulated; the calyx connivent and erect; the corolla is also erect. There are three species; two of which are natives of Great Britain, the glabra and hirsuta.

TURTLE, in ichthyology. See **TESTUDO**.

TURTLE-DOVE, in ornithology. See **COLUMBA**.

TUSCAN ORDER, in architecture. See **ARCHITECTURE**.

TUSCAN Earth, a yellowish kind of bole dug in many parts of Italy, particularly about Florence, where there is a stratum of it eight or ten feet thick, at the depth of five or six feet from the surface. It is supposed to have an astringent property.

TUSCANY (Duchy of), a country of Italy, situated between the Mediterranean, the Tiber, and the Appennines; some parts of it are distributed among the territories of Modena, Lucca, and Genoa, which portions excepted, its extent from north to south is about 115 miles, and its breadth about eighty. The face of the country is beautifully varied with hills and valleys, and the soil rich and fertile, producing corn in abundance, with excellent fruit, oranges, lemons, olives, and grapes. The air, in several parts, is rendered unwholesome by fens and morasses: the salt-pits are rich. Manna is ga-

thered in the marshlands near the sea; and the mountainous parts are rich in mines and minerals. In some places are found amethysts, jaspers, cornelians, crystal, lapis-lazuli, chalcidony, marble, slate, alabaster, sulphur, alum, and quicksilver. Several medicinal springs have been discovered besides those of Pisa. The principal river is the Arno: Florence is the capital. This country was anciently called *Etruria*, and the inhabitants Etrurii, Tyrrheni, and Tuscani, though the present does not include the whole of Etruria: after several revolutions and changes, it became a republic, called, from its chief city, the republic of Florence. In this republic, the Medici family obtained, by commerce, the wealth and grandeur of princes; and Henry II. king of France, chose his consort, the famous Catharine, out of this family. The Emperor Charles V. in the year 1531, at the solicitation of Clement VII. created Alexander Medici duke of Florence; and afterwards gave him in marriage, Margaret, his natural daughter. His nephew and successor, Cosmo I. was, in the year 1569, declared great duke, by Pope Pius V. which title was at last ratified by the Emperor Maximilian II. in the year 1575, on condition of his enjoying and holding it as a fief of the empire. In 1699 the emperor conferred on the great duke the title of royal highness, to which the pope and the court of France readily acquiesced. The great duke, John Gaston, having no heirs, it was stipulated in the fifth article of the quadruple alliance, made in 1718, that the duchy should, by all the contracting parties, be for ever acknowledged a male fief of the Roman empire; and that, with the consent of the Germanic body, the emperor should confer it as a fief on the king of Spain's eldest son by the second marriage, from him to devolve to his male descendants, and on their failure to the younger brother and his heirs; but that Leghorn was always to remain a free port. This was not only confirmed in the treaty of Vienna, in 1725, but the great duke also, and his sister, in 1731, concluded with the king of Spain a family treaty of like import, and the infant Don Carlos was accordingly brought up at the great duke's court at Florence. New differences arising, and, in 1733, breaking out into a war, in which the emperor, in 1734, lost the kingdoms of Naples and Sicily, Don Carlos caused himself to be proclaimed king, and, by the peace of 1736, retained the possessions of these kingdoms. On the other hand it was stipulated, that the great duchy of Tuscany, after the demise of the possessor, should escheat to the House of Lorraine in lieu of that duchy, which was to be resigned to King Stanislaus. This took place in 1737, and by this means became annexed to the house of Austria.

TUSK, or **TORSK**, in ichthyology. See **GADUS**.

TUSSILAGO, **COIT'S ROOT**, in botany: a genus of plants belonging to the class of *jugonesia*, and order of *polygamia superflua*; and in the natural system ranging under the 49th order, *Compositæ*. The receptacle is naked; the pappus simple; the scales of the calyx equal, of the same height as the disk, and somewhat membranaceous. There are 12 species; three of which are indigenous to Britain, the *saxifraga*, *hybrida*, and *petasites*. The *saxifraga*, or common coit's foot, grows plentifully on the banks of rivulets, or in moist and clayey soils in England and Scotland.—The leaves are smoked in the manner of tobacco, or a syrup or decoction of them and the flowers stand recommended in coughs and other disorders of the breast and lungs. It seems now to be almost entirely rejected. The downy substance under the leaves, boiled in a lixivium with a little saltpetre, makes excellent tincture. The *petasites*, or common butter-bur, is frequent in wet meadows, and by the sides of rivers. Its leaves are the largest of any plant in Great Britain, and in heavy rains afford a seasonable shelter to poultry and other small animals. The root dug up

in the spring is refinous and aromatic. A drachm of it in a dole has been sometimes given as a fudorific and alexipharmic; but as it possesses those virtues only in a small degree, it has lost its reputation in the shops.

TUTENAGE, an ore of zinc, containing commonly from 60 to 90 per cent. of zinc, the remainder iron, and a small proportion of clay.

TUTOR, in the civil law, is one chosen to look to the persons and estate of children left by their fathers and mothers in their minority. The different kinds of *tutory* established among the Romans, and the powers and duties of tutors, are described in *Inst. Leg. i. T. XIII. sect. 1. and 2.* to which the reader is referred. See also the article **GUARDIAN**.—For the nature and effects of *tutory* in the Scotch law, which is founded on that of the Roman, see *Scotch Law*, Part III. sect. 7.

TUTOR is also used in the English universities for a member of some college or hall, who takes on him the instructing of young students in the arts and faculties.

TUTTY, an argillaceous ore of zinc, found in Persia, formed on cylindrical moulds into tubulous pieces, like the bark of a tree, and baked to a moderate hardness; generally of a brownish colour, and full of small protuberances on the outside, smooth and yellowish within, sometimes whitish, and sometimes with a bluish cast. Like other argillaceous bodies, it becomes harder in a strong fire; and after the zinc has been revived and dissipated by inflammable additions, or extracted by acids, the remaining earthy matter affords, with oil of vitriol, an aluminous salt. In medicine, *tutty* is celebrated as an opthalmic, and frequently employed as such in unguents and colliria.

TWEED, a river of Scotland, which rises on the confines of the shire of Clydesdale, and running eastward through Tweedale, and dividing the shire of Merse from Teviotdale and Northumberland, falls into the German Sea at Berwick. It abounds with salmon.

TWEEDALE, or **PEEBLESHIRE**, a county of Scotland, bounded on the north by Edinburghshire, on the East by Edinburghshire and Selkirkshire, on the south by Dumfriesshire, and on the west by Lanarkshire; twenty-five miles from north to south, and from ten to eighteen from east to west. The country in general rises in hills, many of which are covered with verdure to their very summits, and between them are pleasant fertile valleys, well watered and interspersed with gentlemen's seats. The principal grain is oats and barley, with few plantations, except round particular houses. This country is sometimes called *Tweedale*, from the river Tweed, which crosses a considerable part. Peebles is the capital.

TWELFTH-DAY, the festival of the Epiphany, or the manifestation of Christ to the Gentiles; so called, as being the twelfth day, exclusive, from the nativity or Christmas-day.

TWILIGHT, that light, whether in the morning before sun-rise, or in the evening after sun-set, supposed to begin and end when the least stars that can be seen by the naked eye cease or begin to appear.

TWINKLING of the STARS. See **OPTICS**.

TWINS, two young ones delivered at a birth, by an animal which ordinarily brings forth but one.

TWITE, in ornithology. See **FRINGILLA**.

TYGER, or **TIGER**, in zoology. See **FELIS**.

TYLE, or **TILE**, in building, a sort of thin laminated brick used on the roofs of houses: or, more properly, a kind of fat clayey earth kneaded and moulded of a just thickness, dried and burnt in a kiln like brick, and used in the covering and paving of houses.

TYMPAN, among printers, a double frame belonging to the press, covered with parchment, on which the blank sheets are laid in order to be printed off. See **PRINTING-Press**.

VOL. X.

TYMPANUM, in mechanics, a kind of wheel placed round an axis or cylindrical beam, on the top of which are two levers or fixed flaves for the more easily turning the axis in order to raise a weight required. The *tympanum* is much the same with the *peritrochium*; but that the cylinder of the axis of the *peritrochium* is much shorter and less than the cylinder of the *tympanum*.

TYMPANUM, in anatomy. See **ANATOMY**.

TYMPANY, in medicine. See **MEDICINE and SURGERY**.

TYNDALE (William), a zealous English reformer, and memorable for having made the first English version of the Bible, was born on the borders of Wales some time before 1500. He was of Magdalene-hall in Oxford, where he distinguished himself by imbibing early the doctrines of Luther, and by as zealously propagating those doctrines among others. Afterwards he removed to Cambridge, and from thence went to live with a gentleman in Gloucestershire in the capacity of tutor to his children.—While he continued there, he showed himself so furious for Luther, and so inveterate to the pope, that he was forced, merely for the security of his person, to leave the place. He next endeavoured to get into the service of Tonstall, bishop of Durham, but did not succeed. His zeal for Lutheranism made him desirous to translate the New Testament into English; and as this could not safely be done in England, he went into Germany, where, setting about the work, he finished it in 1527. He then began with the Old Testament, and finished the five books of Moses, prefixing discourses to each book, as he had done to those of the New Testament. At his first going over into Germany, he went into Saxony, and had much conference with Luther; and then returning to the Netherlands, made his abode chiefly at Antwerp. During his peregrinations from one country to another, he suffered shipwreck upon the coast of Holland, and lost all his books and papers. His translations of the Scriptures being in the mean time sent to England, made a great noise there; and, in the opinion of the clergy, did so much mischief, that a royal proclamation was issued out, prohibiting the buying or reading such translation or translations. But the clergy were not satisfied with this, they knew Tyndale capable of doing infinite harm, and therefore thought of nothing less than removing him out of the way. For this purpose one Philips was sent over to Antwerp, who insinuated himself into his company, and under the pretext of friendship betrayed him into custody. He was sent to the castle of Kilford, about 18 miles from Antwerp; and though the English merchants at Antwerp did what they could to procure his release, and letters were also sent from Lord Cromwell and others out of England, yet Philips beset him so heartily, that he was tried and condemned to die. He was first strangled by the hands of the common hangman, and then burned near Kilford castle, in 1536. While he was tying to the stake, he cried with a fervent and loud voice, "Lord, open the King of England's eyes."

TYPE (τύπος), an impression, image, or representation of some model, which is termed the *antitype*. In this sense the word occurs often in the writings of divines, who employ it to denote that prefiguration of the great events of man's redemption which they have found or fancied in the principal transactions recorded in the Old Testament.

That the death of Christ for the sins of men, and his resurrection from the dead for their justification, were prefigured in the ritual worship instituted by Moses, is indeed incontrovertible; but when divines consider as a type every thing mentioned in the Hebrew Scriptures, in which an active imagination can discover the slightest resemblance or analogy to any circumstance in the life, or death, or resurrection, of Christ, they expose the whole doctrine of *types*

to the ridicule of unbelievers, and do a real injury to that cause which it is their professed intention to serve. To contend as some of them have done, that the extraction of Eve from the side of Adam, while he was in a deep sleep, was intended as a type of the Roman soldier's piercing our Saviour's side while he slept the sleep of death; or that the envy of the sons of Jacob to their brother Joseph, was typical of the envy of the Scribes and Pharisees to Jesus the Messiah, is to burlesque the Scriptures, and insult reason. The nature of types seems indeed to be very little understood even by those who pretend to have studied them with care. They are generally compared to prophecies having a double sense, and are thought to have been so contrived as to give information of the future events to which they pointed; but the information which they gave of Christianity must have been exceedingly obscure, to those who lived before the coming of Christ, however plain it may appear to us who can now compare the type with the antitype. A different opinion has indeed been maintained, not only by mystical cabalists, who will maintain any thing from which common sense revolts, but also by writers who, when treating of other subjects, have shown that they possessed very sound understandings.

TYPE, among letter-founders and printers, the same with letter. See LETTER.

TYPE, is also used to denote the order observed in the intension, and remission of fevers, pulses, &c.

TYPHA, CAT'S TAIL, in botany: a genus of plants belonging to the class of *monoclea*, and order of *triandra*; and in the natural system ranging under the 3d order, *Calamaria*. The amentum of the male flower is cylindrical; the calyx is tripetalous, but scarcely distinguishable; there is no corolla. The female has a cylindrical amentum below the male; the calyx is composed of villous hair; there is no corolla, and only one seed fixed in a capillary pappus. There are two species, both natives of Britain; the *latifolia* and *angustifolia*. 1. *Latifolia*, great cat's tail, or reed mace, is frequent in ponds and lakes. The stalk is six feet high; the leaves a yard long, hardly an inch wide, convex on one side; the amentum, or cylindrical club, which terminates the stalk, is about six inches long, of a dark brown or fuscous colour. Cattle will sometimes eat the leaves, but Schreber thinks them noxious: the roots have sometimes been eaten in fallads, and the down of the amentum used to stuff cushions and mattresses. Linnaeus informs us, that the leaves are used by the coopers in Sweden to bind the hoops of their casks. 2. *Angustifolia*, narrow-leaved cat's tail, is found in pools and ditches. The leaves are semi-cylindrical, and the male and female spike are remote and slender.

TYPHON. See WHIRLWIND.

TYPHON, the devil of the ancient Egyptians. See POLYTHEISM.

TYPOGRAPHY, the art of printing. See PRINTING.

TYRANNION, a celebrated grammarian in Pompey's time, was of Amisus in the kingdom of Pontus. He was the scholar of Dionysius of Thrace at Rhodes. He fell into the hands of Lucullus, when that general of the Roman army defeated Mithridates, and seized his dominions. This captivity of Tyrannion was no disadvantage to him,

since it procured him an opportunity of being illustrious at Rome, and raising a fortune. He spent it, among other things, in making a library of above 30,000 volumes. He died very old, being worn out with the gout. His care in collecting books contributed very much to the preservation of Aristotle's works.

TYRANT, among the ancients, denoted simply a king or monarch; but the ill use which several persons invested with that sacred character made of it, has altered the import of the word; and tyrant now carries with it the idea of an unjust or cruel prince, who invades the people's liberty, and rules in a more despotic manner than the laws of nature or of the country allow.

TYRE, formerly a celebrated city of Asia, on the coast of Syria, situated under the 34th degree of east longitude, and 32d of north latitude. It was built, according to some writers, 2760 years before the christian era. There were two cities of that name; the one called *Palætyrus*, situated on the continent; and the other the city of *Tyre*, built on an island about half a mile from the shore. It was about 19 miles in circumference, including *Palætyrus*; the town on the island was about four miles round. The buildings of Tyre were very magnificent; the walls were 150 feet high, and broad in proportion. This city was at one period the most famous commercial city in the world. Of its commercial transactions, the most particular account that is to be found in any ancient writer has been given by the prophet Ezekiel, which at the same time conveys a magnificent idea of the extensive power of that state. It resisted Nebuchadnezzar king of Babylon for 13 years; at the end of which, wearied with endless efforts, the inhabitants resolved to place the sea between them and their enemy, and passed accordingly into the island. The new city stood out against Alexander the Great for seven months; and before he could take it, he was obliged to fill up the strait which separated the island from the continent. It was repaired afterwards by Adrian, and became the metropolis of the province. It afterwards fell into the hands of the Arabs; and after being taken by Baldwin II. king of Jerusalem, it was destroyed by the sultan of Egypt in 1289, and abandoned, never more to rise from its ruins. An excellent account of its situation and modern state may be found in Volney's Travels, vol. ii. It now consists of a small village, composed of wretched huts, containing about 50 or 60 poor families. The words of Ezekiel are literally fulfilled, "And they shall make a sport of their riches" (Ezek. xxvi. 12, 13, 14.) Mr. Bruce saw this queen of the nations converted into a place for filth to dry their nets in. Its harbour, formerly so famous for its shipping, is now almost choked up. It is called *Sour* or *Tfour* by the Orientals.

TYRIAN DYE. See MUREX and PURPURE.

TYRONE, a county of Ireland, in the province of Ulster, 46 miles in length and 37 in breadth; bounded on the north by Londonderry, on the east by Armagh and Lough-Neagh, on the south by Fermanagh, and on the west by Donnegal. It is a rough and rugged country, but tolerably fruitful; contains 12,683 houses, 30 parishes, 4 baronies, 4 boroughs, and sends 10 members to parliament. The principal town is Dungannon.

U, V.

U or **u**, the 20th letter and 5th vowel of our alphabet, is formed in the voice by a round configuration of the lips, and a greater extrusion of the under one than in forming the letter **o**, and the tongue is also more cannulated. The sound is short in *curst, must, tun, tub*; but is lengthened by a final *e*, as in *tune, tube*, &c. In some words it is rather acute than long; as in *brute, flute, lute*, &c. It is mostly long in polysyllables; as in *union, curious*, &c. but in some words it is obscure, as in *nature, venture*, &c. This letter in the form of **V**, or **v**, is properly a consonant, and as such is placed before all the vowels; as in *vacant, venal, vibrate*, &c. Though the letters **v** and **u** had always two sounds, they had only the form **v** till the beginning of the fourth century, when the other form was introduced, the inconvenience of expressing two different sounds by the same letter having been observed long before. In numerals **V** stands for five; and with a dash added at top, thus **V̄**, it signifies 5000. In abbreviations, amongst the Romans, **V. A.** stood for *veterani assignati*; **V. B.** *viro bono*; **V. B. A.** *virī boni arbitrati*; **V. B. F.** *vir bonæ fidei*; **V. C.** *vir consularis*; **V. C. C. F.** *vale conjux charissimæ, feliciter*; **V. D. D.** *voto dedicatur*; **V. G.** *verbi gratia*; **Vir. Ve.** *virgo vestalis*; **VL.** *videlicet*; **V. N.** *quinto monarum*.

VACCINIUM, the WHORTLE-BERRY, or *Bilberry*, in botany; a genus of plants of the class of *œlandria*, and order of *monogynia*; and arranged in the natural system under the 18th order, *Bicornes*. The calyx is superior; the corolla monopetalous; the filaments inserted into the receptacle; the berry quadrilocular and polypermous. There are 15 species; the most remarkable of which are, 1. The *myrtillus*, black-whort, whortle-berries, or bilberries, growing in woods and on heaths abundantly. The flowers frequently vary, with five segments at the rim, and with ten stamina. The berries when ripe are of a bluish black colour, but a singular variety, with white berries, was discovered by the duke of Athol, growing in the woods, about mid-way between his two seats of Dunkeld and Blair. The berries have an astringent quality. In Arran and the Western Isles they are given in diarrhoeas and dysenteries with good effect. The Highlanders frequently eat them in milk, which is a cooling agreeable food; and sometimes they make them into tarts and jellies, which last they mix with whisky, to give it a relish to strangers.—They dye a violet colour; but it requires to be fixed with alum. The grouse feed upon them in the autumn. 2. The *uliginosum*, or great bilberry bush, is found in low moist grounds, and almost at the summits of the Highland mountains. The leaves are full of veins, smooth and glaucous, especially on the under side; the berries are eatable, but not so much esteemed as the preceding; as they are apt, if eaten in any quantity, to give the headach. 3. The *vitis idæa*, or red whortle-berries, frequent in dry places, in heaths, woods, and on mountains. The berries have an acid cooling quality, useful to quench the thirst in fevers. The Swedes are very fond of them made into the form of a rob or jelly, which they eat with their meat as an agreeable acid, proper to correct the animal alkali. 4. The *oxyccoccus*, cran-berries, moss-berries, or moor-berries, frequent on peat-bogs in the Lowlands, but not so common in the Highlands of Scotland. The stalks are long, slender, woody, weak, and trailing; the leaves are stiff,

acutely oval, glaucous underneath, their edges turned back, and grow alternate; two or three flowers grow singly on long red footstalks out of the extremity of the branches the flowers are red, divided deeply into four acute segments, which are reflexed quite backwards; the filaments are downy; the antheræ ferruginous and longer than the filaments; the berries red, and about the size of the hawthorn berries. At Longtown, on the borders of Cumberland, they are made for considerable an article of commerce; that, at the season when they are ripe, not less than 20l. or 30l.'s worth are sold by the poor people each market-day for five or six weeks together, which are afterwards dispersed over different parts of the kingdom for making the well-known cranberry tarts.

VACUUM, in philosophy, denotes a space empty or devoid of all matter or body. It has been a matter of much dispute among philosophers whether there be in nature a perfect vacuum, or space void of all matter; but if bodies consist of material solid atoms, it is evident that there must be vacuities, or motion would be impossible. (See *METAPHYSICS*.) We can even produce something very near a vacuum in the receiver of an air-pump and in the Torricellian tube (see *PNEUMATICS, passim*); and it is very doubtful whether the particles of the densest bodies known be in perfect contact. See *OPTICS*.

VADIUM, a pledge in law, is either *vivum* or *mortuum*:

VADIUM Vivum, or *Living Pledge*, is when a man borrows a sum (suppose 200l.) of another; and grants him an estate, as of 20l. *per annum*, to hold till the rents and profits shall repay the sum so borrowed. This is an estate conditioned to be void as soon as such sum is raised. And in this case the land or pledge is said to be living: it subsists, and survives the debts; and, immediately on the discharge of that, results back to the borrower.

VADIUM Mortuum, or *Dead Pledge*. See *MORTGAGE*:

VAGABOND, or *VAGRANT*, one who wanders illegally, without a settled habitation. Such persons are cognizable by the laws. See *IDLENESS*.

VAGINA, properly signifies a sheath or scabbard; and the term *vagina*, is used in architecture for the part of a terminus, because resembling a sheath out of which the statue seems to issue.

VAGINA, in anatomy, a canal reaching from the external orifice, or, os ostendit, of women, to the uterus.

VAILLANT (John Foy), a physician and great medalist, to whom, according to Voltaire, France was indebted for the science of medals, and Louis XIV. for one half of his cabinet, was born at Beauvais in 1632. Through the means of the minister Colbert he travelled into Italy, Greece, Egypt, and Persia, to collect medals for the royal cabinet; and returned with so many as made the king's cabinet superior to all in Europe. In one of his voyages the ship he sailed in was fallen upon and taken by an Algerine corsair. After a captivity of near five months he was permitted to return to France, and received at the same time 20 gold medals which had been taken from him. He embarked in a vessel bound for Marseilles, and was carried on with a favourable wind for two days, when another corsair appeared, which in spite of all the fail they could make, bore down upon them within the reach of cannon-shot. Mrs.

Vaillant, dreading the miseries of a fresh slavery, resolved, however, to secure the medals which he had received at Algiers, and in order thereto swallowed them. But a sudden turn of the wind freed them from this adversary, and cast them upon the coasts of Catalonia; where after expecting to run aground every moment, they at length fell among the sands at the mouth of the Rhone. Mr. Vaillant got to shore in a skiff, but felt himself extremely incommoded with the medals he had swallowed, which might weigh altogether five or six ounces, and therefore did not pass like Scarborough waters. He had recourse to a couple of physicians, who were a little puzzled with the singularity of his case; however, nature relieved him from time to time, and he found himself in possession of the greatest part of his treasure when he got to Lyons. Here he explained, with much pleasure to his friends, those medals which were already come to hand, as well as those which were daily expected; among which last was an Otho, valuable for its rarity.—He was much careased on his return; and when Louis XIV. gave a new form to the Academy of Inscriptions in 1701, Mr. Vaillant was first made associate, and then pensionary. He wrote several works relating to ancient coins, and died in 1706.

VAIR, or **VAIRE**, a kind of fur, formerly used for lining the garments of great men and knights of renown. It is represented in engraving by the figures of little bells reversed, ranged in a line. See **HERALDRY**, Chap. II. sect. 2.

VAIRY, in heraldry, expresses a coat, or the bearings of a coat, when charged or chequered with vairs.

VALAIS, a valley in Switzerland, which extends from the source of the river Rhone to the lake of Geneva. It is near 100 miles in length, but the breadth is very unequal. It is bounded on the north by the Alps, which separate it from the cantons of Bern and Uri, on the east by the mountains of Forche, on the south by the duchy of Milan and the Val d'Aoste, and on the west by Savoy and the republic of Geneva. The inhabitants profess the Roman-catholic religion, and are subject to the swelling of the throat called *bronchocele*; and ideots are said to abound among them more than in any other place of the globe. They are naturally hardy, enterprising, and good-natured. It is surrounded on all sides by very high mountains, most of which are covered with snow and ice that never thaw. However the soil is fertile in corn, wine, and good fruit. The muscat wine, which is produced here, is excellent, and well known all over Europe. There are mineral waters, plenty of game, and some mines. This country comprehends 55 large parishes, to which one bishop only belongs, whose see is at Sion the capital. The mountains afford good pasture for their cattle in summer, and their harvest continues from May to October; it being sooner or later according to the situation of the place.

VALANTIA, in botany: a genus of plants in the order *monœcia*, of the class *polygamia*, and in the natural system arranged under the 41st order, the *Aperifloriæ*. There is scarcely any calyx; the corolla is monopetalous, flat, four-parted; the stamina four, with small antheræ: the hermaphrodite flowers have a pistillum with a large germen, a bifid style, the length of the calyx, and one feed; the pistilla of the male flowers are hardly discernible. There are eight species, only one of which is a native of Britain, the *cruciata*; the stalks of which are square, the whole plant hairy, the leaves oval and verrucillate, four in a whirl; the flowers are yellow, and grow on short peduncles out of the axæ of the leaves. The roots, like those of the galiums, to which it is nearly related, will dye red. It is astringent, and was once used as a vulnerary.

VALENCIA, a province of Spain, which has the title of a kingdom; and is bounded on the east and south by the Mediterranean sea, on the north by Catalonia and Arragon, and on the west by New Castile and the kingdom of Murcia. It is about 165 miles in length, and 63 in breadth. It is one of the most populous and agreeable parts of Spain, and where they enjoy almost a perpetual spring. The great number of rivers wherewith it is watered renders it extremely fertile, particularly in fruits and wine. There are very rugged mountains in it, which contain mines of alum and other minerals.

VALENCIA, a city of Spain, and capital of the kingdom of the same name. It contains about 12,000 houses, besides those of the suburbs and the summer-houses round it. It has an university, and an archbishop's see; and was taken from the Moors by the Christians in the 13th century. The town is handsome, and adorned with very fine structures. It is not very strong, though there are some bastions along the sides of the walls. They have manufactures in wool and silk, which bring in great sums to the inhabitants. It is seated on the river Guadalaviar, over which there are five handsome bridges; and it is about three miles from the sea, where there is a harbour: 110 miles north of Murcia, and 165 east by south of Madrid. This city surrendered to the earl of Peterborough in the year 1705; but it was lost again in 1707. W. Long. 6. 10. N. Lat. 39. 23.

VALENCIENNES, an ancient, strong, and considerable city of France, in the department of the North and late province of Hainault. It contains about 20,000 souls. The Scheld divides it into two parts. It is a very important place; the citadel and fortifications, the work of Vauban, were constructed by order of Louis XIV. who took this town from the Spaniards. It was confirmed to him by the treaty of Nimegue, in 1678. In 1793 it surrendered to the allies after a severe siege, but was afterwards abandoned; and is now in the possession of the French republicans. Besides lace, this city is noted for manufactories of woollen stuffs and very fine linens. It is 20 miles west-south-west of Mons, 17 north-east of Cambray, and 120 north-east by north of Paris. E. Long. 3. 37. N. Lat. 50. 21.

VALENS (Flavius), emperor of the East, a great patron of the Arians. Killed by the Goths in the year 379.

VALENTINIAN I. emperor of the West, a renowned warrior, but a tyrant over his subjects. The exploits of this monarch are amply detailed in the Roman History.

VALENTINIAN II. emperor of the West, a prince celebrated for his virtues, and above all for his moderation; yet a conspiracy was formed against him by Arbogastes, the commander in chief of his armies; and he was strangled in the year 392.

VALENTINIANS, in church history, a sect of Christian heretics, who sprung up in the second century, and were so called from their leader Valentinus. The Valentiniens were only a branch of the Gnostics, who realized or personified the Platonic ideas concerning the Deity, whom they called *Pleroma* or *Plenitude*. Their system was this: the first principle is Bythos, i. e. Depth, which remained many ages unknown, having with it Ennoe or Thought, and Sige or Silence; from these sprung the Nous or Intelligence, which is the only son, equal to and alone capable of comprehending the Bythos; the sister of Nous they called *Altheia* or *Truth*; and these constituted the first quaternity of æons, which were the source and original of all the rest: for Nous and Altheia produced the World and Life; and from these two proceeded Man and the Church. But besides these eight principal æons, there were 22 more; the last of which, called *Sophia*, being desirous to arrive at the knowledge of

Bythos, gave herself a great deal of uneasiness, which created in her Anger and Fear, of which was born Matter. But the Horas or Bounder stopped her, preferred her in the Pleroma, and restored her to Perfection. Sophia then produced the Christ and the Holy Spirit, which brought the aëons to their last perfection, and made every one of them contribute their utmost to form the Saviour. Her Enthymese, or Thought, dwelling near the Pleroma, perfected by the Christ, produced every thing that is in the world by its divers passions. The Christ sent into it the Saviour, accompanied with angels, who delivered it from its passions without annihilating it: from thence was formed corporeal matter. And in this manner did their romance concerning God, nature, and the mysteries of the Christian religion.

VALERIAN, or VALERIANUS (Publius Licinius), emperor of Rome, remarkable for his captivity and cruel treatment by Sapor I. king of Persia. See the histories of Rome.

VALERIANA, in botany: a genus of plants belonging to the class *triandria* and order *monogamia*, and in the natural system arranged under the 45th order, *Aggregatæ*. There is hardly any calyx; the corolla is monopetalous, gibbous at the base, situated above the germen; there is only one seed. There are 21 species, only four of which are natives of Britain, the *officinalis*, the *locusta*, the *rubra*, the *divica*; of these only the *officinalis* is useful. The root of this plant is perennal: the stalk is upright, smooth, channelled, round, branched, and rises from two to four feet in height: the leaves on the stem are placed in pairs upon short broad sheaths; they are composed of several lance-shaped, partially dentated, veined, smooth pinnae with an odd one at the end, which is the largest: the floral leaves are spear-shaped and pointed; the flowers are small, of a white or purplish colour, and terminate the stem and branches in large bunches. It flowers in June, and commonly grows about hedges and woods.

It is supposed to be the *œ* of Dioscorides and Galen, by whom it is mentioned as an aromatic and diuretic: it was first brought into estimation in convulsive affections by Fabius Columna, who relates that he cured himself of an epilepsy by the root of this plant: we are told, however, that Columna suffered a relapse of the disorder; and no further accounts of the efficacy of valerian in epilepsy followed till those published by Dominicus Panarolus fifty years afterwards, in which three cases of its success are given. To these may be added many other instances of the good effects of valerian root in this disease, since published by Cruger, Schuchmann, Riverius, Sylvius, Marchant, Chomel, Sauvages, Tissot, and others.

The advantages said to be derived from this root in epilepsy caused it to be tried in several other complaints termed *nervous*, particularly those produced by increased mobility and irritability of the nervous system, in which it has been found highly serviceable. Bergius states its virtues to be antispasmodic, diaphoretic, emmenagogue, diuretic, antelmintic. The root in substance is most effectual, and is usually given in powder from a scruple to a dram: its unpleasant flavour may be concealed by a small addition of mace. A tincture of valerian in proof spirit and in volatile spirit are ordered in the London Pharmacopœia.—Cats are very fond of the smell of this root, and seem to be intoxicated by it.

VALERIUS MAXIMUS, a Latin historian, sprung from the families of the Valerii and Fabii, which made him take the name of *Valerius Maximus*. He studied polite literature, and afterwards followed Sextus Pompey to the wars. At his return he composed an account of the actions and remarkable sayings of the Romans and other great men; and dedicated that work to the emperor Tiberius. Many of the learned think that this is the same that is now extant, and bears the name of Valerius Maximus; but others maintain, that what

we have now is only an abridgment of the work written by this celebrated historian, and that this abridgment was made by one Nepotian of Africa. However, this work is well written, and contains a great number of memorable actions performed by the Greeks and Romans that are worthy of being read.

VALET, a French term, used as a common name for all domestic men-servants employed in the more servile offices, as grooms, footmen, coachmen, &c. But with us it is only used in the phrase *valet de chambre*, which is a servant whose office is to dress and undress his master, &c.

VALETTA, a city of Malta, and capital of the island (see Malta). It is situated in E. Long. 14. 34. N. Lat. 35. 54.

VALETUDINARY, among medical writers, denotes a person of a weak and sickly constitution, and frequently out of order.

VALID, in law, an appellation given to acts, deeds, transactions, &c. which are clothed with all the formalities requisite to their being put into execution, and to their being admitted in a court of justice.

VALLADOLID, a town of Spain, in the province of Leon, on a small river called *Esguava*, near the Pisuerga. The see of a bishop, and an university, founded in the year 1346. Several of the churches of Valladolid, those especially of the Dominicans and of San Benito, are elegant, agreeably to the Spanish taste, that is handsome, and full of altars richly gilt. Valladolid is not wholly without manufactures, some fruffs and coarse cloths are made there from the wool of the sheep which are kept in the neighbourhood. There are also gold and silver-smiths; and one street is entirely inhabited by jewellers. This is very lively, and full of business, as are all the others, which terminate in the great square. An academy of the Belles Lettres was established here, in the year 1752: eighty-four miles NNW. Madrid. Long. 11. 57. E. Peak of Teneriff. Lat. 41. 42. N.

VALVE, in hydraulics, pneumatics, &c. is a kind of lid or cover of a tube or vessel so contrived as to open one way, but which, the more forcibly it is pressed the other way, the closer it shuts the aperture; so that it either admits the entrance of a fluid into the tube or vessel, and prevents its return; or admits its escape, and prevents its re-entrance.

VALVE, in anatomy, a thin membrane applied on several cavities and vessels of the body, to afford a passage to certain humours going one way, and prevent their reflux towards the place from whence they came.

VAMPYRE, a species of bat. See VESPERTILIO.

VAN, a term derived from the French *avant*, or *avant*, signifying before or foremost of any thing; thus we say, the van-guard of the army, &c.

VANBRUGH (Sir John), a celebrated English dramatic writer and architect, was descended of a family in Cheshire which came from France, though by his name he appears to have been originally of Dutch extraction. He was born about the middle of the reign of Charles II. and received a liberal education. His first comedy, called *the Relapse*, or *Virtue in Danger*, was acted in the year 1697 with great applause; which gave him such encouragement, that he wrote eleven more comedies. He was the friend of Mr. Congreve, whose genius was naturally turned for dramatic performances; and these two gave new life to the English stage, and restored its reputation, which had been for some time sinking; but their making vicious persons their most amiable and striking characters, and their bordering too much on obscenity, could be of no service to the cause of virtue; and therefore it was not without reason that they were attacked by Mr. Collier, in his piece on the Immorality and Profaneness of the Stage. However, the reputation Sir John gained by his come-

dies, or his skill in architecture, procured him very considerable advantages. He was appointed Clarencieux king at arms, which he afterwards disposed of. In 1716 he was appointed surveyor of the works at Greenwich hospital: he was likewise made comptroller-general of his majesty's works, and surveyor of all the gardens and waters. He was an able architect; but his performances in that way are esteemed heavy. Under his direction were raised Blenheim-house in Oxfordshire, Claremont in Surrey, and his own house at Whitehall. He died of a quinsy in 1726.

VANDELLIA, in botany: a genus of plants belonging to the class *didymia* and order *angiosperma*. The calyx is subquadriid; the corolla ringent; the two exterior filaments proceed from the disc of the lip of the corolla; the antheræ are connected; the capsule is unilocular and polyspermous. There is only one species known, the *diffusa*.

VAN-DIEMEN'S LAND. See **DIEMEN**.

VAN DYCK (Sir Anthony), a most illustrious painter, was born at Antwerp in 1599, and trained under the no less illustrious Rubens. Afterwards he went to Italy, staid a short time at Rome, and then removed to Venice; where he attained the beautiful colouring of Titian, Paul Veronese, and the Venetian school: proofs of which appeared in the pictures he drew at Genoa, where he left behind him many excellent pieces. After a few years spent abroad, he returned to Flanders, with a manner of painting so noble, natural, and easy, that Titian himself was hardly his superior; and no other master in the world equal to him in portraits. The Prince of Orange, hearing of his fame, sent for him to draw the pictures of his princes and children. Cardinal Richelieu invited him to France; where, not liking his entertainment, he staid but a little time. Then he came over to England, soon after Rubens had left it, and was entertained in the service of Charles I. who conceived a marvellous esteem for his works; honoured him with knighthood; presented him with his own picture, set round with diamonds; assigned him a considerable pension; staid very often to him for his portrait; and was followed by most of the nobility and gentry of the kingdom. He acquired great riches by his profession; married one of the fairest ladies of the English court, a daughter of the lord Ruthen earl of Gowry; and, though he had little with her except her beauty and her quality, lived in a state and grandeur answerable to her birth. He grew weary, towards the latter end of his life, of the continued trouble that attended face-painting; and, being desirous of immortalizing his name by some more glorious undertaking, went to Paris, in hopes of being employed in the grand gallery of the Louvre. Not succeeding there, he returned to England; and proposed to the king, by his friend Sir Kenelm Digby, to make cartoons for the Banqueting-house at Whitehall. The subject was to have been the institution of the order of the garter, the procession of the knights in their habits, with the ceremony of their installment, and St. George's feast: but his demand of 8000*l.* being thought unreasonable, while the king was treating with him for a less sum, the gout and other distempers put an end to his life. He died in 1641, aged forty-two years; and was buried in St. Paul's cathedral, where his monument, whatever it was, perished by the fire.

VANE, a thin slip of bunting hung to the mast-head, or some other conspicuous place in the ship, to shew the direction of the wind. It is commonly sewed upon a wooden frame called the *stock*, which contains two holes whereby to slip over the spindle, upon which it turns about as the wind changes.

VANILLA, or **VANILLO**. See **EPIDENDRUM**.

VAPOUR, in philosophy, the particles of bodies rarefied by heat, and thus rendered specifically lighter than the atmo-

sphere, in which they rise to a considerable height. See **EVAPORATION**, **DAMP**, **GAS**, &c. Many kinds of vapour are unfriendly to animal life, but the most noxious are those which arise from metallic substances. In the smelting and refining of lead, a white vapour arises, which, falling upon the grass in the neighbourhood, imparts a poisonous quality to it, so that the cattle which feed there will die; and in like manner stagnant waters impregnated with this vapour will kill fish. In some places the earth exhales vapours of a very noxious quality; such as the Grotto del Cani, and other places in Italy, where a mephitic vapour constantly hovers over the surface of the ground, proving instantly fatal to such animals as are immersed in it. In some parts of the world there have been instances of people killed, and almost torn to pieces, by a vapour suddenly bursting out of the earth under their feet. Of the *aqueous* vapour raised from the earth by the sun's heat are formed the clouds; but though these are commonly at no great distance from the earth, we cannot from thence determine the height to which the vapours ascend. Indeed, considering the great propensity of water, and even quicksilver, to evaporate in the most perfect vacuum we can make, it is by no means probable that any limit can be fixed for this ascent. See **WEATHER**.

VAPOURS, *noxious*, method of dissipating. The following ingenious method of dissipating the noxious vapours commonly found in wells and other subterraneous places, is related in the Trans. Philadel. by Mr. Robinson of Philadelphia the inventor. "After various unsuccessful trials (says he), I was led to consider how I could convey a large quantity of fresh air from the top to the bottom of the well, supposing that the foul would necessarily give way to the pure air. With this view I procured a pair of smith's bellows, fixed in a wooden frame, so as to work in the same manner as at the forge. This apparatus being placed at the edge of the well, one end of a leathern tube (the hose of a fire-engine) was closely adapted to the nose of the bellows, and the other end was thrown into the well, reaching within one foot of the bottom. At this time the well was so infected, that a candle would not burn at a short distance from the top; but, after blowing with my bellows only half an hour, the candle burned bright at the bottom; then, without farther difficulty, I proceeded in the work, and finished my well. Wells are often made in a very slight manner, owing to the difficulty of working in them, and there have been several fatal instances of the danger attending the workmen; but, by the above method, there is neither difficulty nor danger in completing the work with the utmost solidity. It is obvious, that in cleansing vaults, and working in any other subterraneous place, subject to damps as they are called, the same method must be attended with the same beneficial effect."

VAPOURS, in medicine, a disease properly called *hyp*, or the *hypochondriacal disease*; and in men particularly, the *spleen*. See **MEICINE**.

VAPOUR-BATH, in chemistry, a term applied to a chemist's bath or heat, wherein a body is placed so as to receive the fumes of boiling water. It consists of two vessels, disposed over one another in such manner as that the vapour raised from the water contained in the lower heats the matter included in the upper. It is very commodious for the distilling of odiferous waters, and the drawing of spirit of wine. We also use the term *vapour-bath*, when a sick person is made to receive the vapours arising from some liquid matter placed over a fire. Many contrivances have been proposed for this purpose; and their expediency and utility are best known to those who are conversant in this business. A late writer has suggested a new construction of vapour-baths; and the whole

apparatus is reduced to a tin-boiler, tin pipes wrapped in flannel, and a deal box with a cotton cover, for the reception of the body and circulation of the vapour.

VARI, in medicine, little, hard, and ruddy tumors, which frequently infect the faces of young persons of a hot temperament of body.

VARIATION of the *Compass*, is the deviation of the magnetic or mariner's needle from the meridian or true north and south line. On the continent it is called the *declination* of the magnetic needle; and this is a better term. Our readers know, that the needle of a mariner's compass is a small magnet, exactly poised on its middle, and turning freely in a horizontal direction on a sharp point, so that it always arranges itself in the plane of the magnetic action. We need not add any thing on this head to what has been delivered in the articles *COMPASS* and *Azimuth Compass*.

After the discovery of that most useful property of the magnet, or loadstone, namely, the giving hardened iron and steel a polarity, the compass was for many years used without knowing that its direction in any-wise deviated from the poles of the world; and about the middle of the 16th century, to certain were some of its inflexibly pointing to the north, that they treated with contempt the notion of the variation, which about that time began to be suspected. However, careful observations soon discovered, that in England and its neighbourhood, the needle pointed to the eastward of the true north; but the quantity of this deviation being known, mariners became as well satisfied as if the compass had none; because they imagined that the true course could be obtained by making allowance for the true variation.

From successive observations made afterwards, it was found, that the deviation of the needle from the north was not a constant quantity, but that it gradually diminished; and at last, about the year 1660, it was found at London that the needle pointed due north, and has ever since been getting to the westward; and now the variation is more than 20° to the westward of the north: so that in any one place it may be suspected the variation has a kind of libratory motion, traversing through the north to unknown limits eastward and westward. But the settling of this point must be left to time.

During the time of the said observations it was also discovered, that the variation of the needle was different in different parts of the world, it being west in some places when it was east in others; and in places where the variation was of the same name, yet the quantity of it greatly differed. It was therefore found necessary, that mariners should every day, or as often as they had opportunity, make during their voyage proper observations for an amplitude or azimuth; whereby they might be enabled to find the variation of the compass in their present place, and thence correct their courses.

Dr. Halley published in the last century a theory of the variations of the compass. In this work he supposes there are four magnetic poles in the earth; two of which are fixed and two moveable, by which he explains the different variation of the compass at different times in the same place. But it is impossible to apply exact calculations to so complicated an hypothesis. M. Euler, son of the celebrated geometrician of that name, has however shown, that two magnetic poles placed on the surface of the earth will sufficiently account for the singular figure assumed by the lines which pass through all the points of equal variation in the chart of Dr. Halley.

M. Euler first examines the case wherein the two magnetic poles are diametrically opposite; second, he places them in the two opposite meridians, but at unequal distances from the poles of the world; third, he places them in the same meridians. Finally, he considers them situated in two different

meridians. These four cases may become equally important; because, if it is determined that there are only two magnetic poles; and that these poles change their situations, it may some time hereafter be discovered that they pass through all the different positions.

Since the needle of the compass ought always to be in the plane which passes through the place of observation and the two magnetic poles, the problem is reduced to the discovery of the angle contained between this plane and the plane of the meridian. M. Euler, after having examined the different cases, finds that they also express the earth's magnetism, represented in the chart published by Messrs. Montaine and Dodson in 1744, particularly throughout Europe and North America, if the following principles are established.

Between the arctic pole and the magnetic pole $14^\circ 53'$.

Between the antarctic pole and the other magnetic pole $29^\circ 23'$.

$53^\circ 18'$ the angle at the north pole, formed by the meridian's passing through the two magnetic poles.

250° the longitude of the meridian, which passes over the northern magnetic pole.

As the observations which have been collected with regard to the variation are for the most part loose and inaccurate, it is impossible to represent them all with precision; and the great variations observed in the Indian Ocean seem to require, says M. Euler, that the three first quantities should be 14 , 35 , and 65 degrees. In the mean time, the general agreement is sufficiently satisfactory.

The high reputation of Dr. Halley's magnetical chart renders it more particularly necessary to point out the errors contained therein. There is evidently too little distance between the lines of no variation, of which one crosses the equator 17° westward of London, and the other 119° to the eastward. This makes 136° only; whereas it should necessarily exceed 180 , and even 200 , inasmuch as the pole of the world is supposed further distant from the magnetic pole towards the south than in the north, as is required by the other phenomena. Again, upon the coasts discovered by Diemen, there was no variation in 1642; and Dr. Halley also supposes there was none in 1700. Meanwhile, by the alteration observed at Paris, the line of no variation should be advanced 60° towards the south, which will agree better with the calculations, and prove that the distance of the two intersections was really greater than Dr. Halley had established.

The table of variation of Messrs. Montaine and Dodson is accompanied with several interesting particulars, which equally deserve to be inserted here.

At Barbadoes (says Captain Snow), the variation seems very nearly at a stand: for in the road I observed 5° east; and by Dr. Halley's draught, in the year 1701, $5\frac{1}{2}^\circ$. In 1747, at Port Royal keys, Jamaica, I observed the variation $7^\circ 20' E.$; and on the coast of Carthagena, the same week, off the high land of Santa Martha, $7^\circ 45'$ nearly south of Port Royal. Therefore these curves are not much altered: the curve at Jamaica is nearly at a stand, as though tied, and the fourth part of them with the rest dropping to the westward.

Under the equator, in longitude $40^\circ E.$ of London, the highest variation during the whole 56 years appears to be $17^\circ 4' W.$ and the least $16^\circ \frac{1}{4}' W.$; and in latitude $15^\circ N.$ longitude $60^\circ W.$ from London, the variation has been constantly $5^\circ E.$ But in other places the case has been widely different. For in the latitude of $10^\circ S.$ longitude $60^\circ E.$ from London, the variation has decreased from $17^\circ W.$ to $7^\circ \frac{1}{4}' W.$; and in latitude $10^\circ S.$ longitude $50^\circ W.$ from London, from $2^\circ \frac{1}{4}' W.$ to $12^\circ \frac{1}{4}' W.$; and in latitude $15^\circ N.$ longitude 20° , it has increased from $1^\circ W.$ to $9^\circ W.$

But there is still a more extraordinary appearance in the Indian sea. For instance, under the equator:

LONGITUDE E. from London.	MAGNETICAL VARIATION	
Degrees.	in 1700. Degrees.	in 1756. Degrees.
40	164 West.	164 West.
45	174 W.	144 W.
50	174 W.	114 W.
55	164 W.	84 W.
60	154 W.	6 W.
65	134 W.	44 W.
70	114 W.	34 W.
75	94 W.	1 W.
80	74 W.	04 East.
85	54 W.	14 E.
90	44 W.	1 E.
95	34 W.	01 West.
100	24 W.	1 W.

Where the west variation, in the longitude 40° E. is the same in both the above years; and in 1700 the west variation seemed to be regularly decreasing from longitude 50° E. to the longitude 100° E.: but in 1756, we find the west variation decreasing so fast, that we have east variation in the longitude 80°, 85°, and 90° E. and yet in the longitude 95° and 100° E. we have west variation again.

To these remarks may be joined the following extracts from the *Exposition du calcul astronomique*, by M. de la Lande.

"At the royal observatory in Paris, a magnetical needle of four inches deviated from the N. 18° 10' towards the west, on the 15th of February 1759: and on the 22d of April 1760, the same needle varied 18° 20'. It is indeed natural to conceive, that nothing can be precisely ascertained by 10' upon a circle whose diameter is only four inches. It is nevertheless sufficiently evident, that this variation continues to increase at Paris. In 1610 the needle declined 8° towards the east, so that the variation has changed 26° 20' in the space of 150 years; and this appears particularly since 1740: for the same needle, which has always been used by M. Maraldi, is more than 3° advanced towards the west, beyond what it was at that period; and this makes 9' in one year."

We see the needle frequently disturbed both from its general annual position, and from the change made on it by the diurnal variation. This is probably the effect of auroræ boreales which are inviolable, either on account of thick weather or day-light. Van Swinden says, he seldom or never failed to observe auroræ boreales immediately after any anomalous motion of the needle; and concluded that there had been one at the time, though he could not see it. Since no needle but a magnetic one is affected by the aurora borealis, we may conclude, that there is some natural connection between this meteor and magnetism. This should farther incite us to observe the circumstance formerly mentioned, viz. that the south end of the dipping needle points to that part of the heavens where the rays of the aurora appear to converge. We wish that this were diligently observed in places which have very different variation and dip of the mariner's needle.

For the diurnal and this irregular variation, consult the Disquisitions of Cellius and of Hiorter, in the *Memoirs of Stockholm*; Wargentin, *Philosophical Transactions*, vol. 48. Braun (*Comment. Petropol. Novæ*, T. V. VII. IX.); Graham and Canton as above.

VARIETY, in botany, is a change in some less essential part or quality; as colour, size, pubescence or age.—Externally; by the plaiting or interweaving of the branches—by bundling or uniting of several stalks into one broad flat one; by the greater

breadth, or narrowness, or curling of leaves—by becoming awnless, or smooth, or hirsute. Internally; by becoming mutilated in the corolla; or having one larger than ordinary—by luxuriance, multiplication, or fulness—by becoming prolific, or crested—by bearing bulbs instead of seeds—or being viviparous. The usual causes of variation are, climate, soil, exposure, heat, cold, winds, culture.

VARIOLA, the SMALL-POX. See MEDICINE.

VARIX, in pathology, the dilatation of a vein, arising from the laxity of its coats. A common instance of this occurs in the legs of persons who are afflicted with ulcers; which often arise from varices, and require, for their cure, a bandage or laced stocking.

VARNISH, a clear limpid fluid, capable of hardening without losing its transparency, used by painters, gilders, &c. to give a lustre to their works, to preserve them and defend them from the air.

A coat of varnish ought to possess the following properties: 1. It must exclude the action of the air; because wood and metals are varnished to defend them from decay and rust. 2. It must resist water; for otherwise the effect of the varnish could not be permanent. 3. It ought not to alter such colours as are intended to be preserved by these means. It is necessary therefore that a varnish should be easily extended or spread over the surface, without leaving pores or cavities; that it should not crack or scale; and that it should resist water. Now resins are the only bodies that possess these properties. Resins consequently must be used as the bases of varnish. The question which of course presents itself must then be, how to dispose them for this use? and for this purpose they must be dissolved, as minutely divided as possible, and combined in such a manner that the imperfections of those which might be dissolved to scale may be corrected by others.

Resins may be dissolved by three agents. 1. By fixed oil. 2. By volatile oil. 3. By alcohol. And accordingly we have three kinds of varnish: the fat or oily varnish, essential varnish, and spirit varnish. Before a resin is dissolved in a fixed oil, it is necessary to render the oil drying. For this purpose the oil is boiled with metallic oxides; in which operation the mucilage of the oil combines with the metal, while the oil itself unites with the oxygen of the oxide. To accelerate the drying of this varnish, it is necessary to add oil of turpentine. The essential varnishes consist of a solution of resin in oil of turpentine. The varnish being applied, the essential oil flies off, and leaves the resin. This is used only for paintings. When resins are dissolved in alcohol, the varnish dries very speedily, and is subject to crack; but this fault is corrected by adding a small quantity of turpentine to the mixture, which renders it brighter, and less brittle when dry.

We shall now give the method of preparing a number of varnishes for different purposes.

A Varnish for Toilet-boxes, Cases, Fans, &c.—Dissolve two ounces of gum mastic and eight ounces of gum sandarach in a quart of alcohol; then add four ounces of Venice turpentine.

A Varnish for Waincoats, Cane chairs, Iron-chairs, Grates.—Dissolve in a quart of alcohol eight ounces of gum sandarach, two ounces of seed lac, four ounces of resin; then add six ounces of Venice turpentine. If the varnish is wished to produce a red colour, more of the lac and less of sandarach should be used, and a little dragon's blood should be added. This varnish is so thick that two layers of it are equal to four or five of another.

A Varnish for Fiddles, and other Musical Instruments.—Put four ounces of gum sandarach, two ounces of lac, two ounces

of gum mastic, an ounce of gum elemi, into a quart of alcohol, and hang them over a slow fire till they are dissolved; then add two ounces of turpentine.

Varnish in order to employ Vermilion for painting Equipages.—Dissolve in a quart of alcohol six ounces of sandarach, three ounces of gum lac, and four ounces of rosin; afterwards add six ounces of the cheapest kind of turpentine; mix with it a proper quantity of vermilion when it is to be used.

Gold-coloured Varnish.—Pound separately four ounces of stick lac, four ounces of gamboge, four ounces of dragon's blood, four ounces of annotta, and one ounce of saffron: put each of them separately into a quart of alcohol, and expose them for five days in a narrow-mouthed bottle to the sun, or keep them during that time in a very warm room, shaking them every now and then to hasten the solution. When they are all melted, mix them together. More or less of each of these ingredients will give the different tints of gold according as they are combined. In order to make silver imitate gold exactly when covered with this varnish, the quantity of ingredients must be somewhat greater. The method of gilding silver-leaf, &c. with this varnish is as follows: The silver-leaf being fixed on the subject, in the same manner as gold-leaf, by the interposition of proper glutinous matters, the varnish is spread upon the piece with a brush or pencil. The first coat being dry, the piece is again and again washed over with the varnish till the colour appears sufficiently deep. What is called *gilt leather*, and many picture frames, have no other than this counterfeit gilding. Washing them with a little rectified spirit of wine affords a proof of this; the spirit dissolving the varnish, and leaving the silver-leaf of its own whiteness. For plain frames, thick tin-foil may be used in stead of silver. The tin-leaf, fixed on the piece with glue, is to be burnished, then polished with emery and a fine linen cloth, and afterwards with putty applied in the same manner: being then lacquered over with the varnish five or six times, it looks very nearly like burnished gold. The same varnish, made with a less proportion of the colouring materials, is applied also on works of brass; both for heightening the colour of the metal to a resemblance with that of gold, and for preserving it from being tarnished or corroded by the air.

Oil Varnishes.—Gum copal and amber are the substances principally employed in oil varnishes; they possess the properties necessary for varnishes, solidity, and transparency.—The copal being whitest, is used for varnishing light, the amber for dark colours. It is best to dissolve them before mixing them with the oil, because by this means they are in less danger of being scorched, and at the same time the varnish is more beautiful. They should be melted in a pot on the fire; they are in a proper state for receiving the oil when they give no resistance to the iron spatula, and when they run off from it drop by drop. The oil employed should be a drying oil, and perfectly free from greases.—It should be poured into the copal or amber by little and little, constantly stirring the ingredients at the same time with the spatula. When the oil is well mixed with the copal or amber, take it off the fire; and when it is pretty cool, pour in a greater quantity of the essence of turpentine than the oil that was used. After the varnish is made, it should be passed through a linen cloth. Oil varnishes become thick by keeping; but when they are to be used, it is only necessary to pour in a little essence of turpentine, and to put them for a little on the fire. The turpentine is necessary in oil varnishes to make them dry properly; generally twice as much of it is used as of oil. Less is necessary in summer than in winter. Too much oil hinders the varnish from drying; but when too little is used, it cracks and does not spread properly. We shall subjoin the most useful oil varnishes:

White Copal Varnish.—On sixteen ounces of melted copal

pour four, six, or eight ounces of linseed oil, boiled and quite free from grease. When they are well mixed, take them off the fire (not forgetting to stir them properly); and when pretty cool, pour in sixteen ounces of the essence of Venice turpentine. Pass the varnish through a cloth.—Amber varnish is made in the same way.

Black Varnish for Coaches and Iron Work.—This varnish is composed of bitumen of Palestine, rosin, and amber, melted separately, and afterwards mixed; the oil is then added, and afterwards the turpentine, as directed above. The usual proportions are, twelve ounces of amber, two ounces of rosin, two ounces of bitumen, six of oil, and twelve of the essence of turpentine.—Golden-coloured varnish may be made also by substituting linseed oil for alcohol.

Essential Oil Varnishes.—The only essential oil varnishes used are for pictures. Picture varnishes should be white, light, and quite transparent, which will preserve the colours without giving them any disagreeable tint; and it should be possible to take them off the picture without injuring it. They are usually made of gum mastic and turpentine dissolved together in some essential oil. The varnish is passed through a cloth, and allowed to clarify. It is applied cold to the picture.

Varnish for Glazs, in order to preserve it from the Rays of the Sun.—Pulverise a quantity of gum adragant, and let it dissolve for twenty-four hours in the white of eggs well beat up; then rub it gently on the glazs with a brush.

Varnishes before they are used should be carefully kept from dust, which would spoil them; and they should be kept in a vessel quite clean and dry. When used, they should be lifted lightly with a brush, and spread upon a ground altogether free from dirt and moisture. The substance, after being varnished, should be exposed to the heat of the sun, or placed in a warm room covered with a glass case, to keep out all filth. Oil varnishes require more heat than alcohol varnishes. The varnish should be put on very quickly, making great strokes with the pencil or brush, taking care that these strokes never cross one another; it should be spread equally, and never thicker than a leaf of paper; a second coat should not be put on till the first is quite dry. If the varnish, after being put on, becomes dull and uneven, it must be taken off entirely, and new varnish put on.

When wainscot is to be varnished, it is first painted of a wooden colour. This colour is made by infusing in water either red or yellow ochre (according to the colour wished for), terra ombria (a kind of ochre), and white lead; into this as much as necessary is put of *parlament paste*. Two thin coats of this are to be put on, and, after they are quite dry, the varnish.

Varnishes are polished with pumice-stone and tripoli earth. The pumice-stone must be reduced to an impalpable power, and put upon a piece of serge moistened with water; with this the varnished substance is to be rubbed lightly and equally. The tripoli must also be reduced to a very fine powder, and put upon a clean woollen cloth moistened with olive oil, with which the polishing is to be performed. The varnish is then to be wiped with soft linen, and, when quite dry, cleaned with starch or Spanish white, and rubbed with the palm of the hand or with a linen cloth.

To recover colours or varnish, and to take off the dirt and filth which may adhere to them, a ley is used made of potash and the ashes of lees of wine. Take forty-eight ounces of potash, and sixteen of the above-mentioned ashes, and put them into six quarts of water, and the ley is made: instead of the ashes an equal quantity of potash would probably do as well.—To clean dirty colours, dilute some of this ley with four times its quantity of water, and rub the picture with it.

then wash it with river water; and when dry, give it a coat or two of varnish. In order to take off a varnish, wash it with the above-mentioned ley, then with water, and then lift it off the substance on which it was with any iron instrument.—We shall finish this article with a description of the famous Chinese varnish.

The Chinese varnish is not a composition, but a resin which exudes from a tree called in China *tsi-chu*, “varnish-tree.” This tree grows in several provinces of the southern parts of China. The Chinese take the following method of propagating this tree: in spring they choose a vigorous shoot about a foot in length, which proceeds immediately from the trunk; and coat over the lower part, by which it adheres to the tree, with a kind of yellow earth, at least three inches in thickness. This coat is carefully covered with a mat, to defend it from rain and the injuries of the air. Towards the autumnal equinox they detach a little of the earth, to observe in what condition the small roots are, which begin to spring forth from the shoot. If they find that the filaments which compose them are of a reddish colour, they judge it is time to make an amputation; but they defer it if the roots are white, because this colour shows that they are yet too tender: they then close up the coat again, and wait till the spring following. When the shoot is separated from the trunk of the tree, it is put into the earth; but in whatever season it is planted, whether in spring or autumn, great care must be taken to put plenty of cinders into the hole prepared for it; without this precaution the ants would destroy the yet tender roots, or at least deprive them of all their moisture, and cause them to decay.

The Chinese do not procure varnish from the *tsi-chu* until its trunk is nearly five inches in diameter, which size it seldom attains to before seven or eight years. Varnish extracted from a tree smaller or of less age would not have the same body and splendor. This liquor distils only in the night-time, and during the summer season. To cause the gum to flow, they make several rows of incisions round the trunk, the number of which is proportioned to the vigour of the tree. The first row is seven inches from the earth, and the rest are at the same distance one from the other, and continue to the top of the trunk, and even sometimes on the boughs which are of a sufficient strength and size. The Chinese use a crooked iron for making these incisions, which must run a little obliquely, and be equal in depth to the thickness of the bark; they make them with one hand, and with the other hold a shell, the edges of which they insert into the opening, where it remains without any support. These incisions are made towards evening, and next morning they collect the varnish which has fallen into the shells; the following evening they are again inserted, and this operation is continued until the end of summer. A thousand trees yield almost in one night twenty pounds of varnish.

While the varnish distils, it exhales a malignant vapour, the bad effects of which can only be prevented by preservatives and great precaution. The merchant who employs the workmen is obliged to keep by him a large vase filled with rape-oil, in which a certain quantity of those fleshy filaments have been boiled that are found in hog's lard, and which do not melt. When the workmen are going to fix the shells to the trees, they carry some of this oil along with them, and rub their face and hands with it, which they do with greater care when they collect in the morning the varnish that has distilled during night. After eating, they wash their whole bodies with warm water, in which the bark of the chestnut-tree, fir-wood, crystallised saltpetre, and some other drugs, have been boiled. When they are at work near the trees, they put upon their heads a small cloth bag in which there are two holes, and cover the fore-part of their bodies with a kind of

apron made of doe-skin, which is suspended from their necks with strings, and tied round them with a girdle. They also wear boots, and have coverings on their arms, made of the same kind of skin. The labourer who should attempt to collect varnish without using this precaution, would soon be punished for his rashness, and the most dreadful effects would ensue. The disorder shows itself by tetters, which become of a bright red colour, and spread in a very short time; the body afterwards swells, and the skin bursts and appears covered with an universal leprosy. The unhappy wretch could not long endure the excruciating pains which he feels; did he not find a speedy remedy in those preservatives which are used against the malignant and noxious exhalations of the varnish.

The season of collecting varnish being ended, the merchant puts it into small casks closely stopped. A pound of it newly made costs him about one shilling and eight pence sterling; but he gains *cent. per cent.* upon it, and sometimes more, according to the distance of the place to which he transports it.

Besides the lustre and beauty which that varnish gives to many of the Chinese manufactures, it has also the property of preserving the wood upon which it is laid, especially if no other matter be mixed with it. It prevents it from being hurt either by dampness or worms.

Every workman has a particular art and method of using the varnish. This work requires not only much skill and dexterity, but also great attention, to observe the proper degree of fluidity which the gum ought to have, as it must be neither too thick nor too liquid when it is laid on. Patience above all is necessary in those who wish to succeed. To be properly varnished, a work must be done at leisure; and a whole summer is scarcely sufficient to bring it to perfection. It is therefore rare to see any of those cabinets which are imported to us from Canton so beautiful and durable as those manufactured in Japan, Tong-king, and Nang-king, the capital of the province of Kiang-nan: not that the artists do not employ the same varnish; but as they work for Europeans, who are more easily pleased, they do not take the trouble of giving the pieces which come from their hands all the polish they are capable of receiving.

There are two methods of laying on the varnish; the simplest is, when it is immediately laid on the wood. The work is first polished, and then daubed over with a kind of oil which the Chinese call *tong-yau*. When this oil is dry, it receives two or three coats of varnish; which remain so transparent, that all the shades and veins of the wood may be seen through them. If the artist is desirous of entirely concealing the substance on which they are laid, nothing is necessary but to add a few more coats; these give the work a shining surface, the smoothness of which equals that of the most beautiful ice. When the work is dry, various figures are painted upon it in gold and silver, such as flowers, birds, trees, temples, dragons, &c. A new coat of varnish is then sometimes laid over these figures, which preserves them, and adds much to their splendor. The second method requires more preparation. The Chinese workmen fix to the wood by means of glue a kind of pasteboard, composed of paper, hemp, lime, and other ingredients, well beaten, that the varnish may incorporate with them. Of this they make a ground perfectly smooth and solid, over which the varnish is laid in thin coats, that are left to dry one after the other.

It often happens, that the lustre of varnished tables and other pieces of furniture is insensibly destroyed by tea and warm liquors. “The secret of restoring to varnish its shining black colour (says a Chinese author), is to expose it for one night to a white hoar-frost, or to cover it some time with

"snow." For a method of imitating *Chinese varnish*, see TURNING.

VARNISH, among medalists, signifies the colours antique medals have acquired in the earth. The beauty which nature alone is able to give to medals, and art has never yet attained to counterfeit, enhances the value of them; that is, the colour which certain soils in which they have a long time lain tinges the metals withal: some of which are blue, almost as beautiful as the turquoise; others with an imitable vermilion colour; others with a certain shining polished brown, vastly finer than Brazil figures. The most useful varnish is a beautiful green, which hangs to the finest strokes without effacing them, more accurately than the finest enamel does on metals. No metal but brass is susceptible of this; for the green rust that gathers on silver always spoils it, and it must be got off with vinegar or lemon juice.

Falsifiers of medals have a varnish, which they use on their counterfeits, to give them the appearance of being antique. But this may be discovered by its softness; it being softer than the natural varnish, which is as hard as the metal itself. Some deposit their spurious medals in the earth for a considerable time, by which means they contract a sort of varnish, which may impose upon the less knowing; others use sal ammoniac, and others burnt paper.

VARRO (Marcus Terentius), the most learned of all the Romans, was born 28 years B.C. He was a senator of the first distinction, both for birth and merit; and bore many great offices. He was an intimate friend of Cicero: and this friendship was confirmed and immortalized by a mutual dedication of their learned works to each other. Thus Cicero dedicated his Academic Questions to Varro; and Varro dedicated his treatise on the Latin tongue to Cicero. In the civil wars he was zealously attached to Pompey; but after his defeat soon submitted to Cæsar, who was reconciled to him. Afterwards he applied his whole time to letters, and had the charge of the Greek and Latin libraries at Rome. He was above seventy when Antony proscribed him; however, he found means to escape and save his life, though he could not save some of his works and his library from being plundered by the soldiers. After this storm was over, he pursued his studies as usual; and Pliny relates, that he continued to study and to write when he was eighty-eight years of age. He was eighty when he wrote his three books *De re Rustica*, which are still extant. Five of his books *De lingua Latina*, which he addressed to Cicero, are also extant. There remain too, divers fragments of his works, particularly of his Menippean Satires, which are medleys of prose and verse; and Scaliger has collected some of his epigrams from among the *Catalecta Virgili*. His books *De lingua Latina* and *De re Rustica*, were printed with the notes of Joseph Scaliger, Turnebus, and Victorius, by Henry Stephens, at Paris, 1573, in 8vo. and have been published separately since among the *Auctores de lingua Latina*, and the *Auctores de re Rustica*.

There was another Varro of antiquity, called *Atacinus*, who was born about ten years after the first, at a small town near Narbonne. Though infinitely below the Roman in learning, he was at least as good, if not a better, poet; which perhaps has made Lilius Gyraldus and other critics confound them. He composed many works in verse; some fragments of which were collected, and published with those of other ancient poets, at Lyons in 1603. His chief works were, A poem on the war with the Sequani, a people of Gaul; and the *Astronomics*, that went under the name of *Planciades* the grammarian. But the *Argonautics*, in four books, was what gained him the greatest reputation: and though indeed nothing but a translation of Apollonius Rhodius, yet was so well done as to be commended by Quintilian.

VARRONIA, in botany: a genus of plants belonging to the class of *pentandria*, and to the order of *monogynia*; and arranged in the natural system under the 41st order, *Asperifolia*. The corolla is quinquefid; the fruit a drupa, with a quadrilocular kernel. There are six species; none of which are natives of Britain.

VASE, a term frequently used for ancient vessels dug from under ground, or otherwise found, and preserved in the cabinets of the curious. In architecture, the appellation *vase* is also given to those ornaments placed on corniches, foches, or pedestals, representing the vessels of the ancients, particularly those used in sacrifice, as incense-pots, flower-pots, &c. See *PORTLAND-Vase*.

VASSAL, in our ancient customs, signified a tenant or feudatory; or person who vowed fidelity and homage to a lord, on account of some land, &c. held of him in fee; also a slave or servant, and especially a domestic of a prince.—*Vassalus* is said to be *quasi inferior focius*; as the vassal is inferior to his master, and must serve him; and yet he is in a manner his companion, because each of them is obliged to the other. See *FEDAL System*.

VATICAN, a magnificent palace of the pope, in Rome, which is said to consist of several thousand rooms: but the parts of it most admired are the grand staircase, the pope's apartment, and especially the library, which is one of the richest in the world, both in printed books and manuscripts.

VAUBAN (Sebastien le Prestre, seigneur de), marshal of France, and the greatest engineer that country ever produced, was born in 1633. He displayed his knowledge of fortification in the course of many sieges, and his services were rewarded with the first military honours. He was made governor of Lille in 1668, commissary-general of the fortifications of France in 1678, governor of the maritime parts of Flanders in 1689, and a marshal of France in 1703. He died in 1707, after having brought the arts of attacking and defending fortified places to a degree of perfection unknown before. His writings on these subjects are in the highest esteem.

VAUDOIS, **VALDENSES**, or *Waldenses*, in ecclesiastical history, a name given to a sect of reformers, who made their first appearance about the year 1160. This famous sect, according to Mosheim, arose from Peter, an opulent merchant of Lyons, surnamed *Valdensis*, or *Validisius*, from Vaux or Waldum, a town in the marquisate of Lyons.

Their rules of practice were extremely austere; for they adopted as the model of their moral discipline the sermon of Christ on the mount, which they interpreted and explained in the most rigorous and literal manner, and consequently prohibited and condemned in their society all wars, and suits of law, and all attempts towards the acquisition of wealth, the inflicting of capital punishments, self-defence against unjust violence, and oaths of all kinds.

During the greatest part of the 17th century, those of them who lived in the valleys of Piedmont, and who had embraced the doctrine, discipline, and worship of the church of Geneva, were oppressed and persecuted, in the most barbarous and inhuman manner, by the ministers of Rome. This persecution was carried on with peculiar marks of rage and enormity in the years 1655, 1656, and 1696, and seemed to portend nothing less than the total extinction of that unhappy nation. The most horrid scenes of violence and bloodshed were exhibited in this theatre of papal tyranny; and the few Waldenses that survived were indebted for their existence and support to the intercession made for them by the English and Dutch governments, and also by the Swiss cantons, who solicited the clemency of the Duke of Savoy in their behalf.

VAULT, in architecture, an arched roof, so contrived that

the stones which form it sustain each other. Vaults are on many occasions to be preferred to soffits or flat ceilings, as they give a greater height and elevation, and are besides more firm and durable.

VAYER. See MOTHE.

VAYVODE, or VAIVODE. See WAYVODE.

VEBES (St.), a sea-port town of Portugal, in the province of Estramadura, seated on a bay of the Atlantic Ocean, twenty-one miles south of Lisbon. It stands on an eminence, with a very strong castle built on a rock. The soil about it is fertile in corn, wine, and fruits; and it is furnished with good fish from the sea, and a small lake in the neighbourhood. Here they make great quantities of fine salt, which is carried to the American plantations. E. Long. 8. 54. N. Lat. 38. 22.

UBIQUITARIANS, formed from *ubique*, "every-where," in ecclesiastical history, a sect of Lutherans which rose and spread itself in Germany; and whose distinguishing doctrine was, that the body of Jesus Christ is every-where, or in every place. Brentius, one of the earliest reformers, is said to have first broached this error, in 1560. Luther himself, in his controversy with Zuinglius, had thrown out some unguarded expressions, that seemed to imply a belief of the omnipresence of the body of Christ; but he became sensible afterwards, that this opinion was attended with great difficulties, and particularly that it ought not to be made use of as a proof of Christ's corporeal presence in the eucharist. However, after the death of Luther, this absurd hypothesis was renewed, and dressed up in a specious and plausible form by Brentius, Chemnitzius, and Andraas, who maintained the communication of the properties of Christ's divinity to his human nature. It is indeed obvious, that every Lutheran who believes the doctrine of consubstantiation, whatever he may pretend, must be an Ubiquitarian.

UBIQUITY, OMNIPRESENCE; an attribute of the Deity, whereby he is always intimately present to all things; gives the *esse* to all things; knows, preserves, and does all in all things.

UDDER, in comparative anatomy, that part in brutes wherein the milk is prepared, answering to the mammae or breasts in women. See COMPARATIVE ANATOMY.

VEDAS, the sacred books of the Hindoos, believed to be revealed by God, and called *immortal*. They are considered as the fountain of all knowledge human and divine, and are four in number; of which we have the following account in the first volume of the Asiatic Researches: the *Rigveda* consists of five sections; the *Tajurveda* of eighty-six; the *Sama-veda* of a thousand; and the *At'haraveda* of nine; with eleven hundred *śākhās*, or branches, in various divisions and subdivisions. The *Vedas* in truth are infinite; but have been long reduced to this number and order: the principal part of them is that which explains the duties of man in a methodical arrangement; and in the fourth is a system of divine ordinances. From these are reduced the four *Upavedas*, the first of which was delivered to mankind by BRAHMA, INDRA, DHANWANTARI, and five other deities; and comprises the theory of disorders and medicines, with the practical methods of curing diseases. The second consists of music, invented for the purpose of raising the mind by devotion to the felicity of the divine nature: the third treats of the fabrication and use of arms; and the fourth of *fifty-four* mechanical arts. Of however little value we may esteem the mechanical arts of the Hindoos, and however despicable their theological system may really be, the *Upaveda*, which treats of diseases and the method of curing them, surely deserves to be studied by every European physician practising in India. There are indeed a great number of medical books in the Sanscrit language worthy of attention;

for though the theories of their authors may be groundless and whimsical, they contain the names and description of many Indian plants and minerals, with their uses, discovered by experience, in the cure of diseases.

VEDETE, in war, a sentinel on horseback, with his horse's head towards the place whence any danger is to be feared, and his carbine advanced, with the butt-end against his right thigh. When the enemy has encamped, there are vedettes posted at all the avenues, and on all the rising grounds, to watch for its security.

To VEER and HAUL, to pull a rope tight, by drawing it in and slackening it alternately, till the body to which it is applied acquires an additional motion, like the increased vibrations of a pendulum, so that the rope is strained to a greater tension with more facility and dispatch. This method is particularly used in hauling the bowlines. The wind is said to *veer* and *haul* when it alters its direction, and becomes more or less fair. Thus it is said to veer aft and to haul forward.

VEER, *Ter-Veer*, anciently *Camp-Veer*, a town of Zealand in the United Provinces, standing at the mouth of the East Schelde, about four miles from Middleburgh, and eight from Flushing. Veer, in Dutch, signifies a passage or ferry over an arm of the sea or a river; and as there was once a ferry here over the Schelde to the village of Compen, on the island of North Bevelann, the town thereby got the name of *Veer*, *Camp-Veer*, and *Ter-Veer*. It is well fortified, and formerly enjoyed a good trade, especially to Scotland; the natives enjoying particular privileges here. The harbour is very good, and the arsenal the best furnished in the world. Hence the Veres, anciently earls of Oxford, are said to have derived both their origin and name.

VEERING, or WEARING, the operation by which a ship, in changing her course from one board to the other, turns her stern to windward. Hence it is used in opposition to TACKLING, wherein the head is turned to the wind and the stern to leeward. See SEAMANSHIP.

VEGA (Lopez de), a celebrated Spanish poet. He was the son of Felix de Vega and Franciscan Fernandez, who were both descended from honourable families, and lived in the neighbourhood of Madrid. Our poet was born in that city on the 25th of November, 1562. He was, according to his own expression, a poet from his cradle; and beginning to make verses before he had learned to write, he used to bribe his elder school-fellows with part of his breakfast, to commit to paper the lines he had composed. Having lost his father while he was yet still a child, he engaged in a frolic very natural to a lively boy, and wandered with another lad to various parts of Spain, till, having spent their money, and being conducted before a magistrate at Segovia for offering to sell a few trinkets, they were sent home again to Madrid. Soon after this adventure, our young poet was taken under the protection of Geronimo Manrique, bishop of Avila, and began to distinguish himself by his dramatic compositions, which were received with great applause by the public, though their author had not yet completed his education; for, after this period, he became a member of the university of Alcalá, where he devoted himself for four years to the study of philosophy. He was then engaged as secretary to the Duke of Alva, and wrote his Arcadia in compliment to that patron: who is frequently mentioned in his occasional poems. He quitted that employment on his marriage with Isabel de Urbina, a lady (says his friend and biographer Perez de Montalvan) beautiful without artifice, and virtuous without affectation. His domestic happiness was soon interrupted by a painful incident:—having written some lively verses in ridicule of a person who had taken some injurious freedom with his character, he received a challenge in consequence of his wit; and happening, in the

duel which ensued, to give his adversary a dangerous wound, he was obliged to fly from his family, and shelter himself in Valencia. He resided there a considerable time; but consubstantial affection recalled him to Madrid. His wife died in the year of his return. His affliction on this event led him to relinquish his favourite studies, and embark on board the Armada which was then preparing for the invasion of England. He had a brother who served in that fleet as a lieutenant; and being shot in an engagement with some Dutch vessels, his virtues were celebrated by our afflicted poet, whose heart was peculiarly alive to every generous affection. After the ill success of the Armada, the disconsolate Lopez de Vega returned to Madrid, and became secretary to the Marquis of Malpica, to whom he has addressed a grateful sonnet. From the service of this patron he passed into the household of the Count of Lemos, whom he celebrates as an imitable poet. He was once more induced to quit his attendance on the great, for the more inviting comforts of a married life. His second choice was Juana de Guardio, of noble birth and singular beauty. By this lady he had two children, a son who died in his infancy, and a daughter named *Feliciana*, who survived her father. The death of his little boy is said to have hastened that of his wife, whom he had the misfortune to lose in about seven years after his marriage. Having now experienced the precariousness of all human enjoyments, he devoted himself to a religious life, and fulfilled all the duties of it with the most exemplary piety: still continuing to produce an astonishing variety of poetical compositions. His talents and his virtues procured him many unsolicited honours. Pope Urban VIII. sent him the cross of Malta, with the title of Doctor in Divinity, and appointed him to a place of profit in the Apostolic Chamber; favours for which he expressed his gratitude by dedicating his *Corona Tragica* (a long poem on the fate of Mary Queen of Scots) to that liberal pontiff. In his seventy-third year he felt the approaches of death, and prepared himself for it with the utmost composure and devotion. His last hours were attended by many of his intimate friends, and particularly his chief patron the Duke of Seña, whom he had made his executor; leaving him the care of his daughter *Feliciana*, and of his various manuscripts. The manner in which he took leave of those he loved was most tender and affecting. He said to his disciple and biographer Montalvan, That true fame consisted in being good; and that he would willingly exchange all the applauses he had received to add a single deed of virtue to the actions of his life. Having given his dying benediction to his daughter, and performed the last ceremonies of his religion, he expired on the 25th of August, 1635.

VEGETATION, in physiology, the act whereby plants receive nourishment and growth. The process of nature in the vegetation of plants is very accurately delivered by Malpighi: The egg or seed of the plant being excluded out of the ovary, called *pod* or *bursa*, and requiring further fostering and brooding, is committed to the earth; which having received it into her fertile bosom, not only does the office of incubation by her own warm vapours and exhalation, joined with the heat of the sun, but by degrees supplies what the seed requires for its further growth; as abounding everywhere with canals and sinuses, wherein the dew and rain water, impregnated with fertile salts, glide, like the chyle and blood in the arteries, &c. of animals. This moisture meeting with a new-deposited seed, is percolated, or strained through the pores or pipes of the outer rind or husk, corresponding to the fecundines of the fetuses, on the inside whereof lies one or more, commonly two, thick seminal leaves, answering to the placenta in women, and the cotyledons in brutes.

These seed-leaves consist of a great number of little vesicles,

or bladders, with a tube corresponding to the navel-string in animals. In these vesiculae is received the moisture of the earth, strained through the rind of the seed; which makes a slight fermentation with the proper juice before contained therein. This fermented liquor is conveyed by the umbilical vessel to the trunk of the little plant; and to the germ or bud which is contiguous thereto: upon which a vegetation and increase of the parts succeed.

Such is the procedure in the vegetation of plants: which the illustrious author exemplifies in a grain of wheat, as follows: The first day the grain is sown it grows a little turgid; and the fecundine, or husk, gapes a little in several places; and the body of the plant, being continued by the umbilical vessel to the conglobated leaf (which is called the *pulp* or *flesh* of the seed, and is what constitutes the flower) swells; by which means, not only the germ or sprout (which is to be the future stem) opens, and waxes green, but the roots begin to bunch out; whence the placenta, or seed-leaf, becoming loose, gapes. The second day, the fecundine or husk, being broke through, the stem, or top of the future straw, appears on the outside thereof, and grows upward by degrees; in the mean time, the seed-leaf guarding the roots becomes turgid with its vesiculae, and puts forth a white down. And the leaf being pulled away, you see the roots of the plants bare; the future buds, leaves, and rest of the stalk, lying hid. Between the roots and the ascending stem the trunk of the plant is knit by the navel-knot to the flower-leaf, which is very moist, though it still retains its white colour and its natural taste. The third day, the pulp of the conglobated, or round leaf, becomes turgid with the juice which it received from the earth fermenting with its own.

Thus the plant increasing in bigness, and its bud or stem becoming taller, from whitish turns greenish; the lateral roots also break forth greenish and pyramidal from the gaping sheath, which adheres chiefly to the plant; and the lower root grows longer and hairy, with many fibres shooting out of the same.

Indeed there are hairy fibres hanging all along on all the roots, except on their tips; and these fibres are seen to wind about the saline particles of the soil, little lumps of earth, &c. like ivy; whence they grow curled. Above the lateral roots there now break out two other little ones.

The fourth day, the stem mounting upwards, makes a right angle with the seminal leaf: the last roots put forth more; and the other three growing larger, are clothed with more hairs, which finally embrace the lumps of earth; and where they meet with any vacuity, unite into a kind of network.

From this time forward the root pushes with more regularity downward, and the stalk upward, than before. There is, however, this great difference in their growth, that the stalk and branches find no resistance to their shooting up, while the roots find a great deal to their shooting downward, by means of the solidity of the earth; whence the branches advance much faster and farther in their growth than the roots; and these last often finding the resistance of a tough earth unmountable, turn their course, and shoot almost horizontally.

From a number of experiments made by Mr. Gough, and related by him in the fourth volume of the *Manchester Transactions*, it appears, that seeds will not vegetate without air; and that during their vegetation, they absorb oxygen, part of which they retain, and that carbonic acid is formed with the rest. These facts were ascertained in the following manner: He put several parcels of steeped peas and barley, at different times, into phials, which were left to stand for three or four minutes in spring water, of the heat of 45, 50, to reduce them to a known temperature. They were then

securely corked, and removed into a room, the temperature of which was never less than 53°. After remaining from four to six days in this situation, they were again placed in the same spring water, and opened in an inverted position, care being taken that the barometer stood at the time nearly where it did at first. When a cork was thus drawn, a quantity of water rushed in immediately, more than was sufficient to fill the neck. The air being pulled through lime water, contracted very sensibly, and precipitated the lime. The residuum, freed in this manner from carbonic acid, extinguished a lighted taper like water, and this it did repeatedly. He made one of these experiments with more attention than the rest, from which it appeared, that four ounces one dram forty grains, by measure, of atmospheric air, lost one-sixth of its original bulk, by being confined five days with one ounce of steeped barley. It is plain, from this experiment, that seeds in the act of vegetation take oxygen from the atmosphere, part of which they retain, and reject the rest charged with carbon. The substance of the feed-lobes is hereby changed, an additional quantity of oxygen being introduced into their composition; and a part of their carbon lost. This change, in the proportion of their alimentary principles, generates sugar, as is evident from the process of mauling. But sugar and carbonic acid are more soluble in water than the farinaceous oxyd. They therefore combine with the humidity in the capillary tubes of the feed, and find a ready passage to the germ, the vegetative principle of which they call into action by a stimulus suited to its nature. A nutritious liquor being thus prepared by the decomposition of the feed-lobes, and distributed through the infant plant, its organs begin to exert their specific actions, by decomposing the nourishment conveyed to them, and forming new oxyds from the elementary principles of it, for the increase of the vessels and fibres; and in this manner the first stage of vegetation commences.

Mr. Gough has ascertained, that a germ in the act of vegetation requires to be continually excited by the stimulus of oxygen; but as soon as the feed lobes are exhausted, the young plant is in a state to derive its nutrition from the ground; and then (and not till then) it finds itself in a situation capable of making future advances, unassisted by the stimulus of respirable air.

The infant sprout at first suffers only a suspension of its energy from the absence of pure air; but if this necessary support be withheld too long, it perishes by the putrefactive fermentation.

The lively green which the stems and leaves of plants receive from the action of light, cannot be imparted to them, provided the energy of the vegetative principle in them be suspended: for after permitting a number of peas to produce both extremities of their sprouts in wet sand covered from the light by an earthen pot, Mr. Gough placed five of them, on the 20th of April, in an inverted glass jar, containing azot confined by water; and three in another jar, in which a portion of common air was also enclosed by the same means. On the 30th the upper extremities of the sprouts of the parcel last mentioned were green; but though the experiment was prolonged to the 2d of May, those in the other glass did not exhibit any perceptible alteration in size or colour. Two of them were now placed in a glass filled with atmospheric air, where they were left unobserved to the fifth, at the end of which time the germs had vegetated considerably; the lower parts of them still remained white, but their opposite extremities had changed to their proper green. Hence it may be safely inferred, that greenness cannot be imparted to the sprouts of seeds without the joint action of light and oxygen; in which they are very different from the shoots that frequently

proceed from maturer plants, when secluded from the atmosphere: for, as these grow freely in close glass vessels, placed in a window, and containing water and azot, the parts which are recently produced continue to vegetate, in consequence of their connection with the parent flock, and acquire the colour in question without the assistance of respirable air. See PLANT, TREE, GERMINATION, BOTANY, &c.

VEGETATIVE SOUL, among philosophers, denotes that principle in plants by virtue of which they vegetate, or receive nourishment and grow. See the preceding article.

VEHICLE, in general, denotes any thing that carries or bears another along; but is more particularly used in pharmacy for any liquid serving to dilute fume medicine, in order that it may be administered more commodiously to the patient.

VEII (anc. geog.), a city of Etruria, the long and powerful rival of Rome; distant about 100 stadia, or twelve miles, to the north-west; situated on a high and steep rock. Taken after a siege of ten years by Camillus, six years before the taking of Rome by the Gauls: and thither the Romans, after the burning of their city, had thoughts of removing; but were dissuaded from it by Camillus (Livy). It remained standing after the Punic war; and a colony was there settled, and its territory assigned to the soldiers. But after that it declined gradually, as not to leave a single trace standing. Famous for the slaughter of the 300 Fabii on the Cremera (Ovid). The spot on which it stood lies near Isole, in St. Peter's patrimony (Holfenius).

VEIL, a piece of stuff, serving to cover or hide any thing. In the Romish churches, in time of Lent, they have veils or curtains over the altar, crucifix, images of saints, &c. A veil of crape is wore on the head by nuns, as a badge of their profession: the novices wear white veils, but those who have made the vows black ones. See the article NUN.

VEIN, in anatomy, is a vessel which carries the blood from the several parts of the body to the heart. See ANATOMY.

VEIN, among miners, is that space which is bounded with woughs, and contains ore, spar, canck, clay, chert, croil, brownhen, pitcher-chert, cur, which the philosophers call the *mother of metals*, and sometimes *foil of all colours*. When it bears ore, it is called a *quick vein*; when no ore, a *dead vein*.

VELA, a remarkable cape on the coast of Terra Firma, in South America. W. Long. 71. 25. N. Lat. 12. 30.

VELARIUS, in antiquity, an officer in the court of the Roman emperors, being a kind of usher, whose post was behind the curtain in the prince's apartment, as that of the chancellor's was at the entry of the ballustrade; and that of the ostiarii at the door. The velarii had a superior of the same denomination, who commanded them.

VELEZ-DE-GOMARA, a town of Africa, in the kingdom of Fez, and in the province of Eriff. It is the ancient ACARTH. With a harbour and a handsome castle, where the governor resides. It is seated between two high mountains, on the coast of the Mediterranean Sea. W. Long. 4. o. N. Lat. 35. 10.

VELITES, in the Roman army, a kind of ancient soldiery, who were armed lightly with a javelin, a cask, cuirass, and shield.

VELLEIUS PATERCULUS. See PATERCULUS.

VELLUM, is a kind of parchment, that is finer, evenner, and more white than the common parchment. The word is formed from the French *velin*, of the Latin *vitulinus*, "belonging to a calf."

VELOCITY, in mechanics, swiftness; that affection of motion whereby a moveable is disposed to run over a certain space in a certain time. It is also called *celerity*, and is always

proportional to the space moved. Huyghens, Leibnitz, Bernoulli, Wolfius, and the foreign mathematicians, hold, that the momenta or forces of falling bodies, at the end of their falls, are as the squares of their velocities into the quantity of matter; the English mathematicians, on the contrary, maintain them to be as the velocities themselves into the quantity of matter. See QUANTITY.

VELVET, a rich kind of stuff, all silk, covered on the outside with a close, short, fine, soft flay, the other side being a very strong close tissue. The nap or flay, called also the *velveting*, of this stuff, is formed of part of the threads of the warp, which the workman puts on a long narrow-channelled ruler or needle, which he afterwards cuts, by drawing a sharp steel tool along the channel of the needle to the ends of the warp. The principal and best manufactories of velvet are in France and Italy, particularly in Venice, Milan, Florence, Genoa, and Lucca: there are others in Holland, set up by the French refugees; whereof that at Haerlem is the most considerable: but they all come short of the beauty of those in France, and accordingly are sold for ten or fifteen per cent. less. There are even some brought from China; but they are the worst of all.

VENEERING, VANEERING, or *Finccring*, a kind of marquetry, or inlaying, whereby several thin slices or leaves of fine wood, of different kinds, are applied and fastened on a ground of some common wood. There are two kinds of inlaying: the one, which is the more ordinary, goes no farther than the making of compartments, of different woods; the other requires much more art, and represents flowers, birds, and the like figures. The first kind is what we properly call *vaneering*; the latter we have already described under MARQUETRY. The wood intended for veneering is first sawed out into slices or leaves, about a line thick: in order to faw them, the blocks or planks are placed upright in a kind of vice or sawing press: the description of which may be seen under the article just referred to. These slices are afterwards cut into slips, and fashioned divers ways, according to the design proposed; then the joints being carefully adjusted, and the pieces brought down to their proper thickness, with several planes for the purpose, they are glued down on a ground or block of dry wood, with good strong English glue. The pieces thus joined and glued, the work, if small, is put in a press; if large, it is laid on the bench, covered with a board, and pressed down with poles, or pieces of wood, one end whereof reaches to the ceiling of the room, and the other bears on the boards. When the glue is quite dry, they take it out of the press and finish it; first with little planes, then with divers scrapers, some whereof resemble rasps, which take off dents, &c. left by the planes. When sufficiently scraped, the work is polished with the skin of a sea-dog, wax, and a brush and polisher of slave-grass: which is the last operation.

VENEREAL, something belonging to venery; as the lues venerea, &c. See MEDICINE.

VENERY, is used for the act of copulation, or coition, of the two sexes.

VENESECTION, or PHLEBOTOMY, in surgery. See SURGERY.

VENETIAN BOLE, a fine red earth used in painting, and called in the colour shops *Venetian red*.—It is dug in Carinthia, and sent from Venice to all parts of the world; but the use of it here is very much superfluous by a bright colcothar of vitriol.

VENICE, a city of Italy, and capital of a republic. This city makes a very grand appearance at a distance, as seeming, from its being built on a multitude of islands, to float on the sea; or rather, with its stately buildings and steeples, as it were, rising out of it. The number of these islands is uncer-

tain; some reckoning sixty; others seventy-two; and others again making them amount to one hundred and thirty-eight; but the latter must comprehend, in their calculation, all those places which have gradually been raised in the Laguna; and by diving piles in the ground, fitted for building on. The Laguna, or marshy lake, which lies between the city and the continent, and five Italian miles in breadth, is too shallow for large ships; but, by the attention of the republic, is prevented from becoming part of the continent, and from being ever frozen, so as to bear an army. Towards the sea, the access to the city is also difficult; but the safe and navigable parts are indicated by piles; which, at the approach of an enemy's fleet, can be cut away. Besides, as a considerable number of galleys and men-of-war may be fitted out very expeditiously for sea from the docks, which contain vast quantities of naval stores, the city is strong without fortifications. The fish, which are caught even at the very doors of the houses, may be reputed a good preservative against famine. The several canals, leading to the city among the sand banks and marshy shallows, are, though at a vast expence, kept clear of the mud and slime the flood brings with it. The return of the sea is something later here than every sixth hour, and it generally rises between four and five feet, keeping the water between the islands of the city in continual motion. Some of these canals being very narrow, the mud is not so effectually carried off as to prevent ill smells in hot water. The great canal, which winds through the city, and divides it into two parts, is thirteen hundred paces long. The best way of going up and down the city is in gondolas, which, indeed, strike the eye with a mournful appearance, being all lined either with black cloth or serge, or painted black. Over the several canals are laid four hundred and fifty (some say upwards of five hundred) bridges, great and small, and the better part of them stone: the highest and longest is the Rialto, which, in the middle of the city, crosses the great canal at its narrowest part, where it is but forty paces broad. This bridge consists only of one single arch, whose foundation takes up ninety feet, resting on twelve thousand elm-piles, and every-where incrustated with marble. It is said to have cost the republic two hundred and fifty thousand ducats. In the upper part, it is thirty-seven common paces broad, with two rows of shops, forming as it were three freets, of which that in the middle is the widest. At each end is an ascent of fifty-six steps. The city may, indeed, every-where be traversed on foot; but the freets are very narrow, and the free-stone pavement very slippery in wet weather. The many small bridges, with their steps, are also not a little troublesome. The whole city is said to be six Italian miles in circumference, and to make the tour of it in a gondola takes up somewhat more than two hours. Venice contains seventy parish churches, besides others, fifty-four convents of monks, twenty-six nunneries, seventeen rich hospitals, eighteen oratories, forty religious fraternities, with their chapels: among which are six called Scuole Grandi, fifty-three squares, one hundred and sixty-five marble, and twenty-three half statues. The buildings, indeed, are all of stone; but the greater part make so mean a figure, that this city, in point of beauty and elegance, can in no-wise stand the test with many others. St. Mark's square, it is true, is very fine, and so are the several stately marble palaces that border upon the great canal, though most of them are of Gothic architecture. In the churches and convents, the most admirable part are the paintings; and indeed Venice, highly renowned for fine paintings, far surpasses, in this very respect, even Rome itself. Venice, from the fertility of its neighbourhood, and the facility of carriage, enjoys a constant plenty of all kinds of provisions. The spring-water being very indifferent in most places, almost every house has a cistern, into which the

rain water is conveyed from the roof, and clarified by being filtrated through sand. Water is also brought from the river Brenta, and preserved in cisterns. Among the diversions of Venice, the carnival is accounted the chief. It usually begins the second day of Christmas, and continues till Shrove-Tuesday; consisting chiefly of mascherades and ridottos. The Venetians are passionately fond of mascherades; during the carnival, St. Mark's place is the general rendezvous. The other diversions are plays and operas; mascherades are also permitted at other times, particularly about Ascension-day, at which time there is a fair at St. Mark's place, which begins the Sunday before that festival, and lasts till Whitfuntide. Among the most rational and agreeable diversions of this city, are the concerts. The trade in cloth, especially scarlet, silk goods, and looking-glasses, is still very considerable. Here also gold and silver stuffs are manufactured; which, though not so beautiful as those of France, have a very good sale in the Levant. The Brocatellas (a kind of stuff like brocade), made of coarse silk, are much used for carpets. The invention of public banks is owing to the Venetians; those erected in the several states of Europe being modelled after theirs. The bank of Venice belongs to the state, and pays no interest for any funds lodged in it. Venice is divided into six parts, called *Schierie, Sestieri*. S. Marco contains the piazza di S. Marco, with the adjacent buildings. This square, the pride of the city, forms a right angle, the shortest side of which, two hundred and forty paces long, and seventy-five broad, reaches along the ducale palace. The ducale palace, towards the water-side and St. Mark's place, is entirely Gothic; but on the side of the small canal, and in the court, of modern architecture, and mostly of marble. It not only serves for the residence of the Doge, but also for the meeting of the council. The finest ornaments of the council-chamber and other apartments, are the paintings of famous ancient masters. In the palace, is a little arsenal, where a considerable number of loaded muskets are always kept in readiness, that, in case of an insurrection of the people, the Doge and the nobility may have recourse to this defence; and it is for this purpose, that the council-chamber has a communication through a door with this armoury; every three months the pieces are loaded afresh. In one side of the palace, towards the canal, Rio di palazzo, dark prisons, strongly secured with iron grates, present themselves to view. The lower gallery, or arched walk, on the side of St. Mark's square, together with the opposite hall, is called Broglio. Here, at a certain hour of the day, the nobles take their walks; and, at this time, no Venetian, of an inferior rank, must be seen on it, though a foreigner, as supposed unacquainted with the custom, is not desired to quit the place. That part of St. Mark's square, between these two buildings and the piazza, receives an additional ornament from two pillars of oriental granate, on one of which stands St. Mark's lion in brass, and on the other, a marble statue of St. Theodore. Between these is the place for the public execution of malefactors, through which no nobleman is ever seen to pass. A galley completely rigged and armed, lies close to the Broglio, for the defence of the ducale palace on any sudden emergency. Contiguous to the north part of the Doge's palace, is St. Mark's church, which is also styled the Doge's chapel. Its materials justly entitle it to be called magnificent, being, both on the out and in-side, covered with fine marble: but the architecture is entirely Gothic. The best part of it are the Mosaic paintings, and the four brass horses, formerly gilt, standing over the great door, and said to have been brought here from Constantinople. They are universally allowed to be master-pieces, which very few of the kind can equal. The church treasury is, for the greater part, old fashioned, but very rich in gold and jewels. In it is kept a

very famous manuscript of the gospel of St. Mark, pretended to be autographical; but the dampness of the place where it lies, has spoiled it to such a degree, that no part of it is any longer legible, and it is not so much as certain whether it be written in Latin or Greek. In the Sestiera di Castello, is the so much celebrated arsenal or dock, two Italian miles and a half in circuit, walled and moated in, with twelve towers along its walls; and within the enclosure a great variety of buildings, in which every thing requisite for a land or sea armament is kept in readiness. These buildings consist of an armoury, store-houses for iron-work, oars, cordage, bullets, tar, canvas, guns, &c. a rope-house, a saltpetre-house, smith's forges, a foundry, batons and slips for ship-building, &c. Within it lie the men-of-war, frigates, galleys, and other vessels, with the Bucintauri, which is also laid up here. In the Sestiera di Canale Regio is the theatre; and in this quarter the Jews live, to the amount of fifteen hundred. They must wear a scrap of red cloth in their hats, by way of distinction from Christians. Sestiera di S. Paolo contains the exchange, the bank, &c. On the invasion of Italy, in the fifth century, by the Huns, under their king Attila, and the general desolation that every-where appeared, great numbers of the people, who lived near the Adriatic, took shelter in those islands where now stands the famous city of Venice; and which islands, about the year 421, particularly Rialto, had, in some measure, been built upon by the Paduans, for the advantage of commerce. Here having settled their small places or states, they were at first governed by consuls; afterwards by tribunes, and formed a kind of republic, the council of which was represented by the persons of these magistrates. These islands became still better inhabited on the succeeding incursions of the Goths and Longobardi into Italy; multitudes from Rome and other large cities repairing thither, so that this state became soon able to make head against these bold invaders. At length the chiefs of the islands and the Longobardi came to an agreement, whereby the former were to remain unmolested. This was the commencement of the city and state of Venice. About the beginning of the eighth or the end of the seventh century, the former government of these islands was abolished, and an unlimited power conferred on Paulucio Anafesto, with the title of duke. Under this sovereignty the state greatly increased, till the people, justly becoming weary of the ills of domestic despotism, chose, in the year 1171, another duke, but curtailed his power, by assigning him a council of two hundred and forty persons, composed of commons as well as nobles. Duke Ziani sided with Pope Alexander III. against the Emperor Frederick, and obtained over him such a signal victory at sea, that the pope presented him with a ring, which he was to drop into the Adriatic, as a sign of his marriage with, and perpetual sovereignty over it. The Venetians, who had already extended their dominion into Istria, Dalmatia, Syria, Lombardy, and other places, made a very considerable acquisition, in the beginning of the thirteenth century, by possessing themselves of the principal islands in the Archipelago and Mediterranean, particularly that of Candia. From this time they alone carried on, at an immense profit, the trade for East-India goods, which they imported from Alexandria in Egypt, to which place they were brought across the Red Sea, and by the way of Suez. Under Duke Marino Morosini, was introduced the present form of electing the Doge; and it was at this juncture that jealousy and envy fomented the war with Genoa, which, after continuing 130 years, was at last put an end to by a treaty, in 1381. During this war, Duke Peter Gradenigo, in the year 1296, ordained, that the nobility alone should be capable of sitting in the grand council. Thus the government became aristocratical. In the fourteenth century, the Venetians extended their possessions in

Lombardy; and, in 1473, the last king of Cyprus appointed the state of Venice his heir. Towards the end of the fifteenth century, the Venetian commerce, and, consequently, power, began to decline, when the Portuguese discovered a route by sea to the East Indies, which opened the trade to all nations. In the sixteenth century, the pope, the emperor, France and Spain, joining in a league against them, they were dispossessed of all their towns and places in the kingdom of Naples, the ecclesiastical state, and the Milanese. They received another severe blow from the Turks, who drove them out of the kingdom of Cyprus. In the seventeenth century, a sharp contest arose between the state, the clergy, and the pope, in which, however, they had the advantage. They were also long engaged in troublesome wars with the Turks, losing Candia, and gaining part of Dalmatia and all Morea; but even the greater part of these have been lost in the wars of the last century. Thus has the republic of Venice continued now upwards of 1300 years, amidst many foreign wars, and intestine commotions. Its grandeur was chiefly owing to trade and liberty; and since the decline of the former, its strength, of consequence, must have suffered a considerable diminution. The power is lodged in the hands of the nobility, who are said to be near 2000, including those whom public employments in the provinces oblige to reside out of Venice. On the birth of a nobleman's son, his name is entered in the golden book, otherwise he forfeits his nobility. Every noble is, indeed, a member of the senate; and, on this account, it is a received maxim, that they all are equal in dignity. But the difference, notwithstanding, between the interest and authority of families, is very considerable. To the first class belong the ancient houses, whose ancestors chose the first duke, and who, from thence, are called *Le Case Elettorali*. These are the Contarini, Morosini, Badovari, Tiepoli, Michieli, Sanudi, Gradenighi, Memmi, Faleri, Dandali, Polani, and Barozzi; and on them, preferable to others, are conferred the higher offices; the Giustiniani, Cornari, Bragadini, and Bembi, pretend to an equality with the foregoing, being very little inferior to them in point of antiquity. Next follow eight houses almost as ancient; among which the most distinguished are Quirini, Delfini, Soranzo, Zorzi, and Marcetti. The second class has its origin from the Serrar del Consiglio; Duke Grandinigo having passed a law that the council should perpetually consist of the families which then composed it, and some others which he ennobled. This produced a second class of nobility, who, accordingly, were then registered in the golden book. It consists of upwards of eighty families, and some of great wealth and reputation, as the Mocenighi, Capoli, Foscarini, Foscare, Grimani, Gritti, Gossioni, Loredani, Donati, Malipieri, Nani, Pisani, Pefari, Priuli, &c. with these are also included those families that were raised to nobility after the Genoese war, on account of their large contributions towards carrying it on with vigour. Many of this degree are now extinct, and the principal among the surviving are, the Trevisani, Vandramini, Renieri, Giusti, and Pasqualighi. The third and last class is composed of the Cittadini, or citizens, whose nobility was purchased for 100,000 Venetian ducats, a resource of the republic for raising money in necessitous times. Crowned heads, German and other princes, have not thought it any degradation to be made nobles of Venice. The habit of the nobility, whilst at Venice, is a black furred gown reaching to their heels, with a belt about three inches broad, and plated with silver. Instead of hats they have long caps. The head of the republic is the doge, or duke, who, on the demise of the former, is chosen in the following manner: all the nobili above thirty years of age meet in the palace of St. Mark, where an equal number of balls to those present are put into an urn. Thirty of these are gilded, and the others silvered over. Every noble, in his turn, takes out a ball; and they who have drawn

the thirty gilt balls, retire into a chamber, to continue the election. But that there may be but one person of a family among the electors, the relations of him who draws a golden ball immediately withdraw from the council; and the same number of white balls are taken out of the urn. The thirty electors again draw from another urn, in which are twenty-one silvered, and nine gilded balls: they who draw the gilded, choose forty other electors of quite different families, though they may nominate themselves; and every one of the four first has a right of nominating five; but the five others can name only four each. These electors are again, by lots, reduced to twelve, who name twenty-five: the first nominating three, and each of the other, two. These twenty-five draw lots a second time to be reduced to nine; and of these nine each chooses five others, and, from the total forty-five, eleven are separated again by lot, who choose forty-one others; the eight first nominating four, and the three last only three. These forty-one are, according to the form in all preceding elections, confirmed by the grand council; and, being shut up in a chamber of the ducal palace, there remain till they have chosen a new doge. To the due and legal election of a doge, it is required that out of the forty-one he should have twenty-five votes. His election is followed by a kind of coronation; the ducal cap, the forepart of which projects, as a mark of the unlimited power of the republic, being placed with great ceremony on his head. This is performed at his public entrance into St. Mark's church, where he is received, by the illustrious Signoria, on the great steps, called *Lascala de Giganti*, and afterwards conducted to the upper step, where the cap is placed on his head. The doge has been very justly defined to be, in habit and state, a king; in authority a counsellor; in the city, a prisoner; and out of it, a private person. He is not so much as to stir from the city without the council's permission. At present his privileges consist in the following principal particulars: That the coin be stamped with his name, but not his image. That all the credentials of the republic's ministers to foreign courts be made out in his name, though without either his signature or seal, and his family is not to be subject to any sumptuary laws. His yearly income is 12,000 Venetian ducats. Of this sum he must spend one half on the four grand entertainments, which he is obliged to give every year; and, to live up to his dignity, he must also spend considerably of his own fortune. Among the restrictions, are the following: during his life, none of his children or brethren can hold any of the great honorary offices, nor be sent on embassies. He is not so much as to ask the pope for any benefice, nor to accept of any when offered, the purple only excepted. He is not to marry the sister or relation of a prince, without the consent of the great council. He cannot resign, but may be deposed. He is not to receive any present whatever from a foreign prince. In state affairs, he cannot transact the least matter without the council. During his life, he is subject to the council of ten, who keep a watchful eye over his whole administration, and, at any time, can come and search his most private apartments. In general, his authority, essentially considered, is no greater than that of a private person, unless he be of such abilities as to influence the whole council; then, indeed, his authority bears the sway; but it seldom happens that such persons are chosen. On his death, a formal enquiry is made, whether he has abused his power; whether, from a care of his own concerns, he neglected those of the public; whether he lived agreeably to his dignity, &c. If found guilty of any thing alleged to his charge, his heirs are fined in proportion to the nature of the crime. However, the ducal dignity is solicited, and the person duly elected is not to decline it. On ascension-day, the doge, or, in case of illness, the vice-doge, who is always one of the six consiglieri, performs the annual frivolous ceremony of marrying the Adriatic Sea, in a barge pompously gilt and

carved, called the Bucentauro, on board of which are also the Signoria and all foreign ministers. The patriarch having poured into it a quantity of holy water, which is said to prevent or allay any storms, the doge, through an aperture near his seat, drops into the sea a golden ring, of a few dollars' value, saying these words, *Deponamus te, mare, in signum veri perpetue dominii*: That is, We epouse thee, O sea, in token of a real and perpetual dominion over thee. In the grand council, all nobles of the age of twenty-five years, may take their place, though some younger find means to obtain admittance. It usually meets on Sundays and holidays, in the large hall of the ducal palace, and, when all the nobility are present, consists of near 2000 persons. The senate, or *pregadi*, are a committee of the grand council, by whom they are also chosen. This senate has the management of the most secret and important state affairs, as the making alliances and peace, declaring war, sending ambassadors, coining money, filling up offices, imposing taxes, &c. Next is the collegium, in which all public instruments directed to the state and doge, are read, audiences given to foreign ministers, and other matters of importance transacted. It consists of the doge, six counsellors, &c. the three *capidella* *quarantia criminale* (or presidents of the *quarantia*, or court of forty), the six *savi-grandi* (or the chief-officers of state), the five *savi di terra firma* (or the military officers), the five *savi degli ordini* (who, though conductors of sea affairs, are here little more than mute spectators). Of these three great assemblies, the presidentship is lodged in the signoria, or *il configlietto*, composed of the doge and his six counsellors, who are, as it were, the wardens of the people, one being chosen from every *fetteria*, or sixth part of the city. The procurators of St. Mark have not only the inspection of the church of St. Mark, its library, and the records of the republic, but likewise manage all affairs relating to the poor, together with wills, guardianships, redemption of christian slaves, and bringing over-rigid creditors to a reasonable composition. Their number never exceeds nine: their office is of great authority and during life, and it is out of them that the doge is generally chosen. Titular, or extraordinary procurators of St. Mark, are more numerous; the republic gladly selling these titles in a public scarcity of money. *Il configlio di dieci* is a high penal court, which consists of ten counsellors, the doge, who is president, and his six *configliieri*. With regard to the state of religion and the clergy in the countries of the republic, the established religion is the Roman-catholic; but Greeks, Armenians, and Jews, are allowed the public exercise of their worship, and protestants, observing privacy, remain unmolested. At the head of the church-government is the patriarch of Venice, the chief ecclesiastic in the republic. He is always a noble Venetian, and chosen by the senate; and though confirmed by the pope, must, in all other respects, be independent of the papal chair. The territories of the republic are under governors chosen out of the nobility, who are changed at the expiration of a certain term of years. The commander in chief of an entire province, is called *proveditore generale*, or governor. In a large town is a *podesta* and *castellano*; and the military affairs are managed by a *capitano*. Appeals from the inferior courts in the town are carried to the *quarantia civile* at Venice, or civil court of forty persons. The annual revenue of the republic is computed at 8,200,000 ducats, and is under the direction of three *governatori dell'Entrate*. In war-time, both the nobles and the other subjects, even the doge, contribute proportionably to their incomes towards defraying the public expenses. The states of Italy subject to the Venetians, are the Dogado, the Paduan, the Polceine di Rovigo, the Veronese, the Vicentin, the Bresian, the Bergamasco, the Cremasco, the Trevigiano, the Feltrin, the Bellunese, the Cadorian; great part of Friuli and Istria. To these may be added a part of Dalmatia, the islands of Corfu, Zante, Cephalonia, Paxu, Anti-

paxu, and some others. The number of inhabitants in the city of Venice is estimated at 160,000, and, of the whole state, at 2,500,000: Venice is situated 216 miles N. Rome. Long. 30. E. Ferro. Lat. 45. 28. N.

VENIRE FACIAS, in law, is a judicial writ lying where two parties plead and come to issue, directed to the sheriff, to cause twelve men of the same neighbourhood to meet and try the fame, and to say the truth upon the issue taken.

VENTER, signifies the belly; but it is also used for the children by a woman of one marriage: there is in law a first and second venter, &c. where a man hath children by several wives; and how they shall take in descents of lands.

VENTER Inpiciendo, is a writ to search a woman that faith she is with child, and thereby withholdeth lands from the next heir: the trial whereof is by a jury of women.

VENTILATOR, a machine by which the noxious air of any close place, as an hospital, gaol, ship, chamber, &c. may be discharged and changed for fresh.

The noxious qualities of bad air have been long known; and no one has taken greater pains to set the mischief arising from foul air in a just light than Dr. Hales; who has also proposed an easy and effectual remedy by the use of his ventilators; his account of which was read to the Royal Society in May 1741. In the November following, M. Triewald, military architect to the king of Sweden, informed Dr. Mortimer, secretary to the Royal Society, that he had in the preceding spring invented a machine for the use of his majesty's men-of-war, in order to draw out the bad air from under their decks, the least of which exhausted 36,172 cubic feet of air in an hour, or at the rate of 21,732 tons in twenty-four hours. In 1742 he sent one of them, formed for a 60-gun ship, to France; which was approved of by the Royal Academy of Sciences at Paris; and the king of France ordered all the men-of-war to be furnished with the like ventilators.

The ventilators invented by Dr. Hales consist of a square box ABCD (Pl. 3. fig. 1.) of any size; in the middle of one side of this box a broad partition or midriff is fixed by hinges X, and it moves up and down from A to C, by means of an iron rod ZR, fixed at a proper distance from the other end of the midriff, and passing through a small hole in the cover of the box up to R. Two boxes of this kind may be employed at once, and the two iron rods may be fixed to a lever FG (fig. 2.) moving on a fixed centre O; so that by the alternate raising and pressing down of the lever FG, the midridfs are also alternately raised and depressed, whereby these double bellows are at the same time both drawing in air, and pouring it out, through apertures with valves made on the same side with, and placed both above and below, the hinges of the midridfs. In order to render the midridfs light, they are made of four bars lengthwise, and as many across them breadthwise, the vacant spaces being filled up with thin panels of fir-board; and that they may move to and fro with the greater ease, and without touching the sides of the boxes, there is an iron regulator fixed upright to the middle of the end of the box AC (fig. 1.) from N to L, with a notch cut into the middle of the end of the midriff at Z; so that the midridfs, in rising and falling, suffer no other friction than what is made between the regulator and the notch. Moreover, as the midriff ZX moves with its edges only one-twentieth of an inch from the sides of the box ABCDEF, very little air will escape by the edges; and, therefore, there will be no need of leathern sides as in the common bellows. The end of the box at AC is made a little circular, that it may be better adapted between A and C to the rising and falling midriff; and at the other end X of the midriff a slip of leather may be nailed over the joints if needful. The eight large valves through which the air is to pass, are placed at the hinge-end of the boxes BK (fig. 2.) as at 1, 2, 3, &c. The valve v opens inward to admit the air to enter, when the midriff is depressed at the other end by means of,

Fig. 2.

Fig. 1.

Fig. 3.

Fig. 1.

Fig. 2.

WEIGHING

The lever FG. And at the same time the valve 3 in the lower ventilator is shut by the compressed air which passes out at the valve 4. But when that midriff is raised, the valve 1 shuts, and the air passes out at the valve 2. And it is the same with the valves 5, 6, &c. of the other box; so that the midriffs are alternately rising and falling, and two of the ventilators drawing in air, and two blowing it out; the air entering at the valves 1, 3, 6, 8, and passing out at the valves 2, 4, 5, 7. Before these last valves there is fixed to the ventilators a box QQNM (fig. 3) as a common receptacle for all the air which comes out of these valves; which air passes off by the trunk P, through the wall of a building. For a farther account of this machine we refer to the author himself, who gives a full detail of it and of its manner of working. See Description of Ventilators by Stephen Hales, D.D. Lond. 1743, 8vo.

The ventilators in large ships, since the order for ventilating the fleet issued by the lords of the admiralty in 1756, are fixed in the gunner's fore-store-room, and generally a-head of the sail-room. The foul air is carried up through the decks and fore-castle near the fore-mast, sometimes above it, and sometimes abaft it, but more frequently on its starboard side; the lever, by which the ventilators are worked, is under the fore-castle in two-deck ships, and between the upper and middle decks in three-deckers; sometimes the lever is hung athwart ships; in some ships afore and aft, and in others oblique. The iron rod, which communicates the motion from the lever, passes through the partners of the fore-mast, and is connected with another lever, suspended at or near the middle; in some ships over the ventilators, in others under them, when it is found necessary to fix them up to the deck. The best method to save room is to place the ventilators over one another with their circular ends together; the air-trunk should be so high above deck, that the men on deck may not be incommoded by the foul air which blows out of it; and therefore the trunk comes through the upper deck, near and behind the fore-mast. For the method of freeing mines, ships, prisons, &c. from noxious air by means of fire-pipes, see PNEUMATICS.

VENTRICLE, properly denotes any little cavity; but is more particularly used by physicians and anatomists for the stomach and certain cavities of the heart and brain.

VENTRILOQUISM, an art by which certain persons can so modify their voice, as to make it appear to the audience to proceed from any distance, and in any direction. Some faint traces of this art are to be found in the writings of the ancients; and it is the opinion of M. de la Chapelle, who in the year 1772 published an ingenious work on the subject, that the responses of many of the oracles were delivered by persons thus qualified, to serve the purposes of priest-craft and delusion. As the ancient ventriloquists, when exercising their art, seemed generally to speak from their own bellies, the name by which they were designed was abundantly significant: but it is with no great propriety that modern performers are called *ventriloquists*, and their art *ventriloquism*, since they appear more frequently to speak from the pockets of their neighbours, or from the roof or distant corners of the room, than from their own mouths or their own bellies.

From Brodeau, a learned critic of the 16th century, we have the following account of the feats of a capital ventriloquist and cheat, who was valet de chambre to Francis the First. The fellow, whose name was *Louis Brabant*, had fallen desperately in love with a young, handsome, and rich heiress; but was rejected by the parents as an unsuitable match for their daughter, on account of the lowliness of his circumstances. The young lady's father dying, he made a visit to the widow, who was totally ignorant of his singular talent. Suddenly, on his first appearance, in open day, in her own house, and in the presence of several persons who were with her, she heard herself accosted, in a voice perfectly resembling

that of her dead husband, and which seemed to proceed from above, exclaiming, "Give my daughter in marriage to Louis Brabant: He is a man of great fortune, and of an excellent character. I now endure the inexpressible torments of purgatory, for having refused her to him. If you obey this admonition, I shall soon be delivered from this place of torment. You will at the same time provide a worthy husband for your daughter, and procure everlasting repose to the soul of your poor husband."

The widow could not for a moment resist this dread summons, which had not the most distant appearance of proceeding from Louis Brabant; whose countenance exhibited no visible change, and whose lips were close and motionless, during the delivery of it. Accordingly, she consented immediately to receive him for her son-in-law. Louis's finances, however, were in a very low situation; and the formalities attending the marriage contract rendered it necessary for him to exhibit some show of riches, and not to give the ghost the lie direct. He accordingly went to work upon a fresh subject, one Cornu, an old and rich banker at Lyons; who had accumulated immense wealth by usury and extortion, and was known to be haunted by remorse of conscience on account of the manner in which he had acquired it.

Having contracted an intimate acquaintance with this man, he, one day while they were sitting together in the usurer's little back parlour, artfully turned the conversation on religious subjects, on demons and spectres, the pains of purgatory, and the torments of hell. During an interval of silence between them, a voice was heard, which to the astonished banker seemed to be that of his deceased father, complaining, as in the former case, of his dreadful situation in purgatory, and calling upon him to deliver him instantly from thence, by putting into the hands of Louis Brabant, then with him, a large sum for the redemption of Christians then in slavery with the Turks; threatening him at the same time with eternal damnation if he did not take this method to expiate likewise his own sins. The reader will naturally suppose that Louis Brabant affected a due degree of astonishment on the occasion; and further promoted the deception, by acknowledging his having devoted himself to the prosecution of the charitable design imputed to him by the ghost. An old usurer is naturally suspicious. Accordingly the wary banker made a second appointment with the ghost's delegate for the next day; and, to render any design of imposing upon him utterly abortive, took him into the open fields, where not a house, or a tree, or even a bush, or a pit, were in sight, capable of screening any supposed confederate. This extraordinary caution excited the ventriloquist to exert all the powers of his art. Wherever the banker conducted him, at every step his ears were saluted on all sides with the complaints and groans not only of his father, but of all his deceased relations, imploring him for the love of God, and in the name of every saint in the calendar, to have mercy on his own soul and theirs, by effectually seconding with his purse the intentions of his worthy companion. Cornu could no longer resist the voice of Heaven, and accordingly carried his guest home with him, and paid him down 10,000 crowns; with which the honest ventriloquist returned to Paris, and married his mistress.—The catastrophe was fatal. The secret was afterwards blown, and reached the usurer's ears, who was so much affected by the loss of his money, and the mortifying ralleries of his neighbours, that he took to his bed and died.

This trick of Louis Brabant is even exceeded by an innocent piece of wagery played off not forty years ago by another French ventriloquist on a whole community. We have the story from M. de la Chapelle, who informs us, that M. St. Gill, the ventriloquist, and his intimate friend, returning home from a place whither his business had carried him, sought for

shelter from an approaching thunder-storm in a neighbouring convent. Finding the whole community in mourning, he enquired the cause, and was told that one of their body had died lately, who was the ornament and delight of the whole society. To pass away the time, he walked into the church, attended by some of the religious, who showed him the tomb of their deceased brother, and spoke feelingly of the scanty honours they had bestowed on his memory. Suddenly a voice was heard, apparently proceeding from the roof of the quire, lamenting the situation of the defunct in purgatory, and reproaching the brotherhood with their lukewarmness and want of zeal on his account. The friars, as soon as their astonishment gave them power to speak, consulted together, and agreed to acquaint the rest of the community with this singular event, so interesting to the whole society. M. St. Gill, who wished to carry on the joke still farther, dissuaded them from taking this step; telling them that they would be treated by their absent brethren as a set of fools and visionaries. He recommended to them, however, the immediately calling of the whole community into the church, where the ghost of their departed brother might probably reiterate his complaints. Accordingly all the friars, novices, lay-brothers, and even the domestics of the convent, were immediately summoned and collected together. In a short time the voice from the roof renewed its lamentation and reproaches, and the whole convent fell on their faces, and vowed a solemn reparation. As a first step, they chanted a *De profundis* in a full choir; during the intervals of which the ghost occasionally expressed the comfort he received from their pious exercises and ejaculations on his behalf. When all was over, the prior entered into a serious conversation with M. St. Gill; and on the strength of what had just passed, sagaciously inveighed against the absurd incredulity of our modern sceptics and pretended philosophers on the article of ghosts or apparitions. M. St. Gill thought it now high time to disabuse the good fathers. This purpose, however, he found it extremely difficult to effect, till he had prevailed upon them to return with him into the church, and there be witnesses of the manner in which he had conducted this ludicrous deception.

A ventriloquist, who performed feats somewhat similar to these, made his appearance in Edinburgh; and many of the other towns of Scotland, a few months before the writing of this article. He imitated successfully the voice of a squeaking child, and made it appear to proceed from whatever place he chose; from the pockets of the company, from a wooden doll, with which he held many spirited conversations; from beneath a hat or a wine-glass, and out of any person's foot or hand. When the voice seemed to come from beneath a glass or hat, it was dull and on a low key, as sounds confined always are; and what evinced his dexterity was, that when the glass was raised from the table during the time of his speaking, the words or syllables uttered afterwards were on a higher key, in consequence, one would have thought, of the air being readmitted to the speaker. This part of the experiment failed, however, when the management of the glass was at a distance committed to any of the company; but as the room was not well illuminated, they are inclined to attribute this failure to the ventriloquist's not being able to perceive at what precise instant of time the glass was removed from the table. The same artist imitated the tones of a scolding old woman, disturbed at unreasonable hours by a person demanding admission into her house; but this exhibition did not to us appear masterly. The tones of the old woman and the child were not accurately discriminated: the child was a young scold, and the scold spoke like an angry child. We have heard that, when in Edinburgh, the same practitioner astonished a number of persons in the Fishmarket, by making a fish appear to speak, and give the lie to its vender, who affirmed that it was fresh, and caught in the

morning; and whether this fact was really performed or not, we cannot doubt, from what we saw and heard him do, but that he was fully equal to its performance.

Our ventriloquist was an illiterate man; and though sufficiently communicative, could not make intelligible to us the manner in which he produced these acoustic deceptions. Indeed if he had, we should hardly have described the practical rules of the art to the public; for though it is proper to make the existence of such an art universally known, it will readily occur to every reflecting mind, that the attainment of it should not be rendered easy to those who, like Louis Brabant, might make it subservient to the purposes of knavery and deception. The speculative principles on which it is founded must be obvious to every man who has studied the philosophy of the human mind, and has ever witnessed the feats of mimicry.

It is undoubtedly true, that, previous to experience, we cannot refer sound to any external cause; that it does not therefore give immediate indication of the place or distance of the sonorous body; and that it is only by the association of place with sound that the latter becomes an indication of the former. This being admitted, nothing seems requisite to fit a man for becoming an expert ventriloquist but a delicate ear, flexibility of the organs of speech, and long practice of those rules which repeated trials would enable him to discover. A delicate ear perceives every difference which change of place produces in the same sound; and if a person possessed of such an ear have sufficient command over his organs of speech, to produce by them a sound in all respects similar to another proceeding from any distant object, it is evident that to the audience the sound which he utters must appear to proceed from that object. If this be the true theory of ventriloquism, it does not seem to be possible for the most expert ventriloquist to speak in his usual tones of conversation, and at the same time make the voice appear to come from a distance; for these tones must be supposed familiar to his audience, and to be in their minds associated with the ideas of his figure, place, and distance. Hence the ventriloquist whom we saw appeared to speak from various places only in the tones of the squeaking child, while Louis Brabant and M. St. Gill, in their great feats, imitated the voices of ghosts, to which no man could be familiar, and where terror would greatly contribute to the deception. There can, however, be no doubt, but that if, by a peculiar modification of the organs of speech, a sound of any kind can be produced, which in faintness, tone, body, and in short every other sensible quality, perfectly resembles a sound delivered from the roof of an opposite house; the ear will naturally, without examination, refer it to that situation and distance, the sound which the person hears being only a sign, which he has from his infancy been constantly accustomed, by experience, to associate with the idea of a person speaking from a house-top. It is evident too, that when there is no particular ground of suspicion, any small disparity between the two sounds will not be perceptible. But if our theory be just, that experience or habit which misleads a person who has seldom heard the ventriloquist, and is a stranger to his powers, at length finds another person right who is acquainted with them, and has been a frequent witness of their effects. This was actually the case of M. de la Chapelle, with whom the illusion at length ceased, in consequence of repeated visits to M. St. Gill: so that while others, ignorant of his talent, and possessed only of their old or habitual experience with regard to articulate sounds, considered his voice as coming from the top of a tree, or from a deep celler under ground; our author, well acquainted with the powers of the ventriloquist, and having acquired a new kind of experience, at once referred it directly to the mouth of the speaker.

VENUS, in Pagan worship, the goddess of love and beauty.

Cicero mentions two other deities of this name. *Venus, fyled Urania and Celestis*; and the *Venus Pandemos* or *Populæris*, the wife of Vulcan, and the goddess of wanton and effeminate love. To the first the Pagans ascribed no attributes but such as were agreeable to the strictest chastity and virtue; and of this deity they admitted no corporeal resemblance, the being only represented by the form of a globe, ending conically. Her sacrifices were termed *nephalia*, on account of their sobriety. To her, honey and wine were offered, and no animal except the heifer; and on her altars the wood of figs, vines, or mulberries, were not suffered to be burnt. The Romans dedicated a temple to this goddess, to whom they gave the name of *Vetricordia*; because she turned the hearts of lewd women, and inspired modesty and virtue.

But the most famous of these goddesses is the wife of Vulcan; who is represented as springing from the froth raised by the genitals of Saturn, when cut off by Jupiter and thrown into the sea. As soon as the foam was formed, she was laid in a beautiful shell embellished with pearl, and wafted by gentle zephyrs to the isle of Cythera, whence she sailed to Cyprus. At her landing, flowers rose beneath her feet; she was received by the Hours, who braided her hair with golden fillets; and then wafted her to heaven, where her charms appeared so attractive, that most of the gods desired her in marriage; but Vulcan, by the advice of Jupiter, gained possession by putting poppies into her nectar. As Venus was the goddess of love and pleasure, the poets have been lavish in the description of her beauties; and the painters and statuary have endeavoured to give her the most lovely form. Sometimes she is represented clothed in purple, glittering with gems, her head crowned with roses, and drawn in an ivory car by swans, doves, or sparrows; at others she stands attended by the Graces; but in all positions, her son Cupid is her inseparable companion. She was honoured as the mother of Hymeneus, Cupid, Æneas, and the Graces, and was passionately fond of Adonis and Anchises.

This goddess was principally worshipped at Paphos and Cyprus; and the sacrifices offered to her were white goats and swine, with libations of wine, milk, and honey. Her victims were crowned with flowers, or wreaths of myrtle.

VENUS, in astronomy. See **ASTRONOMY** and **PNEUMATICS**.

VENUS's Fly-trap. See **DIONÆA Muscipula**.

VENUS, in zoology, a genus of insects belonging to the order of vermes testacea. This animal is a tethys: the shell is bivalve; the hinge with three teeth near each other, one placed longitudinally and bent inwards. There are a great many species; of which the most remarkable is the *merenaria*, or commercial, with a strong, thick, weighty shell, covered with a brown epidermis; pure white within; slightly striated transversely. Circumference above eleven inches.—These are called in North America *clams*; they differ from other species only in having a purple tinge within. Wampum, or Indian money, is made of them.

VEPRECULÆ, diminutive from *vepre*, "a briar or bramble;" the name of the 31st order in Linnaeus's Fragments of a Natural Method. See **BOTANY**.

VERA-CRUZ, a sea-port town in North America, in New Spain, with a very secure and commodious harbour, defended by a fort. Here the Flotilla annually arrives from Spain to receive the produce of the gold and silver mines of Mexico; and at the same time a fair is held here for all manner of rich merchandize brought from China and the East Indies by way of the South Sea, and for the merchandize of Europe by the way of the Atlantic Ocean. This town is not two miles in circumference; and about it there is a wall of no great strength

on the land-side. The air is unwholesome; and there are very few Spaniards here unless when the Flotilla arrives, and then it is crowded with people from all parts of Spanish America. It is 200 miles south-east of Mexico. W. Long. 37. 25. N. Lat. 19. 12.

VERAGUA, a province of New Spain, bounded on the east by that of Costa Rica, on the west by Panama, on the north by Darien and the Gulf of Mexico; and on the south by the South Sea. It is about 125 miles in length from east to west, and 60 in breadth from north to south. It is a mountainous barren country; but has plenty of gold and silver. Conception is the capital town.

VERATRUM, in botany: a genus of plants of the class of *polygamia*, and order of *monœcia*; and in the natural system arranged under the 10th order, *Coronariæ*. There is no calyx; the corolla has six petals; there are six stamina: the hermaphrodite flowers have three pistils and three capsules. There are three species, none of which are natives of Britain. The most important is the *album*, or hellebore, the root of which is perennial, about an inch thick, externally brown, internally white, and beset with many strong fibres; the stalk is thick, strong, round, upright, hairy, and usually rises four feet in height: the leaves are numerous, very large, oval, entire, ribbed, plaited, without footstalks, of a yellowish green colour, and surround the stem at its base; the flowers are of a greenish colour, and appear from June to August in very long, branched, terminal spikes.

It appears from various instances, that every part of the plant is extremely acrid and poisonous, as its leaves and even seeds prove deleterious to different animals. Greding employed it in a great number of cases of the maniacal and melancholic kind; the majority of these, as might be expected, derived no permanent benefit; several, however, were relieved, and five completely cured by this medicine. It was the bark of the root, collected in the spring, which he gave in powder, beginning with one grain: this dose was gradually increased according to its effects. With some patients one or two grains excited nausea and vomiting, but generally eight grains were required to produce this effect, though in a few instances a scruple and even more was given.

Veratrum has likewise been found useful in epilepsy, and other convulsive complaints; but the diseases in which its efficacy seems least equivocal, are those of the skin; as scabies and different prurient eruptions, herpes, morbus pediculofus, lepra, scrophula, &c. and in many of these it has been successfully employed both internally and externally.

As a powerful stimulant, and irritating medicine, its use has been resorted to only in desperate cases, and then it is fit to be tried in very small doses in a diluted state, and to be gradually increased according to the effects.

VERB, in grammar. See **GRAMMAR**.

VERBASCUM, in botany: a genus of plants of the class of *pentandria*, and order of *monogynia*; and in the natural system arranged under the 28th order, *Luridæ*. The corolla is rotated, and rather unequal: the capsule is monolocular and bivalved. There are 12 species, five of which are natives of Britain; 1. The *thapsus*, or great mullein, which has a stem single, simple, erect, covered with leaves, about six feet high. Leaves large, broad, white, woolly on both sides, sessile, decurrent. Flowers terminal, in a long spike, sessile, yellow. Catarrhal coughs and diarrheas are the complaints for which it has been internally prescribed. Dr. Home tried it in both, but it was only in the latter disease that this plant succeeded. He relates four cases in which a decoction of verbascum was given; and from which he concludes, that it "is useful in diminishing or stopping diarrheas of an old standing, and

often in easing the pains of the intestines. These acquire a great degree of irritability; and the ordinary irritating causes, aliment, bile, distension from air, keep up a quicker peristaltic motion. This is obviated by the emollient and perhaps gentle astringent qualities of this plant." 2. The *nigrum*, or black mullein, having a stem beset with hairs that are beautifully branched; the blossoms yellow, with purple tips. It is a beautiful plant, and the flowers are grateful to bees. Swine eat it; there are not found of it; cows, horses, and goats, refuse it. The other British species are the *lychnitis*, *nigrum*, *blattai*, and *virgatum*.

VERBENA, in botany: a genus of plants of the class of *diandria*, and order of *monogynia*; and in the natural system arranged under the 40th order, *Personate*. There are 17 species, only one of which is a native of Britain; the *officinalis*, or common vervain, which grows on the road-sides near towns and villages. The leaves have many jagged clefts, the blossoms are pale blue. It manifests a slight degree of astringency, and was formerly much in vogue as a deobstruent; but is now disregarded. Mr. Millar says, that it is never found above a quarter of a mile from a house; whence the common people in England call it *Simpler's joy*, because, wherever it is found, it is a certain sign of a house being near. Sheep eat it; cows, horses, and goats, refuse it.

VERD (Cape), a promontory on the west coast of Africa, forty miles north-west of the mouth of the river Gambia. W. Long. 17. 38. N. Lat. 14. 45. The islands of Cape de Verd are seated in the Atlantic Ocean, about 400 miles west of the Cape. They are between the 13th and 19th degree of latitude; and the principal are ten in number, lying in a semicircle. Their names are, *St. Anthony*, *St. Vincent*, *St. Lucia*, *St. Nicholas*, the *Ile of Sal*, *Bona Vista*, *Mayo*, *St. Jago*, *Fuego*, and *Brava*.

VERDICT (*Vere dictum*), is the answer of the jury given to the court concerning the matter of fact, in any case civil or criminal, committed by the court to their trial and examination. See LAW and TRIAL.

VERDIGRISE, the acetite of copper, much used by painters as a green colour. It is chiefly manufactured at Montpellier; the vines of Languedoc being very convenient for this purpose. The following process for making verdigrise is described by Mr. Monet of the Royal Society of Montpellier, and is published among the memoirs of the academy for the years 1750 and 1753.

Vine-stalks well dried in the sun are steeped during eight days in strong wine, and afterwards drained. They are then put into earthen pots, and upon them wine is poured. The pots are carefully covered. The wine undergoes the acetous fermentation, which in summer is finished in seven or eight days; but requires a longer time in winter, although this operation is always performed in cellars. When the fermentation is sufficiently advanced, which may be known by observing the inner surface of the lids of the pots, which during the progress of the fermentation is continually wetted by the moisture of the rising vapours, the stalks are then to be taken out of the pots. These stalks are by this method impregnated with all the acid of the wine, and the remaining liquor is but a very weak vinegar. The stalks are to be drained during some time in baskets, and layers of them are to be put into earthen pots with plates of Swedish copper, so disposed that each plate shall rest upon and be covered with layers of stalks. The pots are to be covered with lids; and the copper is thus left exposed to the action of the vinegar, during three or four days, or more, in which time the plates become covered with verdigrise. The plates are then to be taken out of the pots, and left in the cellar three or four days; at the end of which time they are to be moistened with water, or with the weak

vinegar above mentioned, and left to dry. When this moistening and drying of the plates has been thrice repeated, the verdigrise will be found to have considerably increased in quantity; and it may then be scraped off for sale.

A solution or erosion of copper, and consequently of verdigrise, may be prepared by employing ordinary vinegar instead of wine, as is directed in the above process. But it would not have the unctuality of ordinary verdigrise, which quality is necessary in painting. Good verdigrise must be prepared by means of a vinous acid, or solvent half acid and half spirituous. Accordingly, the success of the operation depends chiefly on the degree of fermentation to which the wine employed has been carried: for this fermentation must not have been so far advanced that no sensibly vinous or spirituous parts remained in the liquor.

Verdigrise is employed externally for detegering foul ulcers, and as an escharotic. It is rarely or never given internally. Some recommend it indeed in the dose of a grain or two as an emetic, which operates almost as soon as received into the stomach, and which may therefore be of use where poisonous substances have been taken, to procure their immediate rejection.

VERDITER, or VERDATER, a preparation of copper, sometimes used by the painters, &c. for a blue; but more usually mixed with a yellow for a green colour. See COLOUR-Making.

VERE (Sir Francis), a renowned English general, was the second son of Geoffrey de Vere, a branch of the ancient family of that name, earls of Oxford, and was born in the year 1554. Concerning his education we are uninformed. About the age of thirty-one he began his military career in Holland, in the courts of which Queen Elizabeth declared him the *worthiest captain of her time*. (See *Letters of the Sidney Family*, vol. ii. p. 104.) But the last and most glorious achievement of his life was his gallant defence of Otford, with about 1600 men, against an army of 12,000, from July 1601 until March 1602, when he resigned the government, and returned to Holland. He died in 1608, in the 54th year of his age; and was buried in St. John's chapel in Westminster abbey, where a splendid monument was erected to his memory. He married the daughter of a citizen of London, named Dent, by whom he had three sons and two daughters, none of whom survived him. He will ever be remembered by posterity as one of the greatest heroes of our most heroic age. A military work of his, entitled, "The Commentaries of Sir Francis Vere, being diverse pieces of service wherein he had command; written by himself by way of commentary," will afford ample information respecting his exploits. It was printed at Cambridge, 1657, in folio, elegantly adorned with prints of Sir Francis, Sir Horace Vere, Sir John Ogke, maps, and plans of battles, &c.

VERGE (*Virgata*), in law, signifies the compass of the king's court, which bounds the jurisdiction of the lord steward of the household; and which is thought to have been twelve miles round. The term *verge* is also used for a stick or rod, whereby one is admitted tenant to a copyhold estate, by holding it in his hand, and swearing fealty to the lord of the manor.

VERGERS, certain officers of the courts of king's bench and common pleas, whose business it is to carry white wands before the judges. There are also vergers of cathedrals, who carry a rod tipped with silver before the bishop, dean, &c.

VERGIL (Polydore). See VIRGIL.

VERJUICE, a liquor obtained from grapes or apples, unfit for wine or cyder; or from sweet ones, whilst yet acid and unripe. Its chief use is in sauces, ragouts, &c. though it is also an ingredient in some medicinal compositions, and is used by the wax-chandlers to purify their wax.

VERMES, the sixth class of animals in the Linnæan system, comprehending five orders. See **NATURAL HISTORY**, and **ZOOLOGY**.

VERMICELLI, or **VERMICHELLY**, a composition of fine flour and eggs, reduced to a paste, and formed into long slender threads or strings, by forcing it with a piston through a number of little holes. It was first brought from Italy, where it is in great vogue: it is chiefly used in soups, and is an excellent article of food.

VERMIFORMIS, in anatomy, a term applied to various parts in the human body, bearing some resemblance to worms: as the appendix vermiformis of the intestines.

VERMILION, a very bright and beautiful red colour, composed of quicksilver and sulphur, in great esteem among the ancients under the name of *minium*; but what goes by the name of minium amongst us, is a preparation of lead, known also by the name of *red-lead*. This substance is well known to artists.

VERMIN, a collective name, including all kinds of little animals and insects, which are hurtful or troublesome to mankind, beasts, or fruits, &c. as worms, lice, fleas, caterpillars, ants, flies, &c.

VERNIER SCALE, a scale excellently adapted for the graduation of mathematical instruments, thus called from its inventor Peter Vernier, a person of distinction in the Franche Comté. See **NONIUS**. Vernier's method is derived from the following principle. If two equal right lines, or circular arcs, A, B, are so divided, that the number of equal divisions in B is one less than the number of equal divisions of A, then will the excess of one division of B above one division of A be compounded of the ratios of one of A to A₁, and of one of B to B₁.

For let A contain 11 parts, then one of A to A is as 1 to 11, or $\frac{1}{11}$. Let B contain 10 parts, then one of B to

B is as 1 to 10, or $\frac{1}{10}$. Now $\frac{1}{10} - \frac{1}{11} = \frac{11 - 10}{10 \times 11} =$

$$\frac{1}{10 \times 11} = \frac{1}{10} \times \frac{1}{11}.$$

Or if B contains n parts, and A contains $n + 1$ parts; then $\frac{1}{n}$ is one part of B, and $\frac{1}{n+1}$ is one part of A.

$$\text{And } \frac{1}{n} - \frac{1}{n+1} = \frac{n+1-n}{n \times n+1} = \frac{1}{n} \times \frac{1}{n+1}.$$

The most commodious divisions, and their aliquot parts, into which the degrees on the circular limb of an instrument may be supposed to be divided, depend on the radius of that instrument.

Let R be the radius of a circle in inches; and a degree to be divided into n parts, each being $\frac{1}{n}$ th part of an inch.

Now the circumference of a circle, in parts of its diameter 2 R inches, is $3,1415926 \times 2$ R inches.

Then $360^\circ : 3,1415926 \times 2$ R :: $1^\circ : \frac{3,1415926}{360} \times 2$ R inches.

Or, $0,01745329 \times R$ is the length of one degree in inches.

Or, $0,01745329 \times R \times p$ is the length of 1° , in p th parts of an inch.

But as every degree contains n times such parts, therefore $n = 0,01745329 \times R \times p$.

The most commodious perceptible division is $\frac{1}{8}$, or $\frac{1}{10}$ of an inch.

Example. Suppose an instrument of 30 inches radius, into how many convenient parts may each degree be divided? how many of these parts are to go to the breadth of the vernier, and to what parts of a degree may an observation be made by that instrument?

Now $0,01745 \times R = 0,5236$ inches, the length of each degree: and if p be supposed about $\frac{1}{8}$ of an inch for one division; then $0,5236 \times p = 4,188$ shows the number of such parts in a degree. But as this number must be an integer, let it be 4, each being $15'$: and let the breadth of the vernier contain 31 of those parts, or $74'$, and be divided into 30 parts.

Here $n = \frac{1}{4}$; $m = \frac{1}{30}$; then $\frac{1}{4} \times \frac{1}{30} = \frac{1}{120}$ of a degree, or $30'$, which is the least part of a degree that instrument can show.

If $n = \frac{1}{5}$, and $m = \frac{1}{36}$; then $\frac{1}{5} \times \frac{1}{36} = \frac{60}{5 \times 36}$ of a minute, or $20''$.

The following table, taken as examples in the instruments commonly made from 3 inches to 8 feet radius, shows the divisions of the limb to nearest tenths of inches, so as to be an aliquot of $60'$'s, and what parts of a degree may be estimated by the vernier, it being divided into such equal parts, and containing such degrees as their columns show.

Rad inches.	Part in a deg.	Parts in vernier.	Breadth of vernier.	Parts observed.
3	1	15	$15\frac{1}{2}$	4 0'
6	1	20	$20\frac{1}{4}$	3 0
9	2	20	$10\frac{1}{2}$	1 30
12	2	24	$12\frac{1}{3}$	1 15
15	3	20	$6\frac{1}{2}$	1 0
18	3	30	$10\frac{1}{3}$	0 40
21	4	30	$7\frac{1}{2}$	0 30
24	4	36	$9\frac{1}{3}$	0 25
30	5	30	$7\frac{1}{2}$	0 20
36	6	30	$5\frac{1}{2}$	0 20
42	8	30	$3\frac{1}{2}$	0 15
48	9	40	$4\frac{1}{2}$	0 10
60	10	36	$3\frac{1}{3}$	0 10
72	12	30	$2\frac{1}{2}$	0 10
84	15	40	$2\frac{1}{4}$	0 6
96	15	60	4	0 4

By altering the number of divisions, either in the degrees or in the vernier, or in both, an angle can be observed to a different degree of accuracy. Thus, to a radius of 30 inches, if a degree be divided into 12 parts, each being five minutes, and the breadth of the vernier be 21 such parts, or $15'$, and divided into 20 parts, then $\frac{1}{12} \times \frac{1}{20} =$

$$\frac{1^\circ}{240} = 15'' \text{ or taking the breadth of the vernier } 21 \times 2, \text{ and divided into 30 parts; then } \frac{1}{12} \times \frac{1}{30} = \frac{1^\circ}{360}, \text{ or } 10'' :$$

Or $\frac{1}{12} \times \frac{1}{50} = \frac{1^\circ}{600} = 6''$; where the breadth of the vernier is $4\frac{1}{2}$.

VERONA, a city of Italy, capital of the Veronese, in the territory of Venice, situated near the mountains, on the river

Adige, in E. Long. 11. 24. N. Lat. 45. 26. It is seven miles in compass; was fortified by the Venetians; and contains 57,400 inhabitants.

VERONESÉ, a territory of Italy, in the republic of Venice, bounded on the north by the Trentino, on the east by the Vicentino and Paduano, on the south by the Mantuano, and on the west by the Bresciano. It is about 35 miles in length, and 27 in breadth; and is one of the most fertile countries in Italy, abounding in corn, wine, fruits, and cattle.

VERONESÉ. See **CAGLIARI**.

VERONICA, in botany: a genus of plants of the class of *diandria*, and order of *monogynia*; and in the natural system arranged under the 40th order, *Personate*. There are forty species; 15 are natives of Britain, only two of which have been applied to any use. 1. The *officinalis*, common male speed-well, or fluellin; a native of Britain, growing on heaths and barren grounds. The blossoms are blue, the leaves elliptical, serrated, and hairy. The leaves have a small degree of astringency, and are somewhat bitter. An infusion of them is recommended by Hoffman as a substitute for tea; but is more astringent and less grateful. The herb was formerly esteemed in medicine for various disorders, but is now almost totally disused. Cows, sheep, goats, and horses, eat it; swine refuse it. 2. The *buccabunga*, or common brook-lime, the flowers of which are blue, in loose lateral spikes; leaves sessile, oval, opposite, thick, notched. This plant was formerly considered as of much use in several diseases, and was applied externally to wounds and ulcers; but if it have any peculiar efficacy, it is to be derived from its antiscorbutic virtue.

VERSAILLES, a town of France, and principal place of a district, in the department of the Seine and Oise. In the beginning of the last century, it was a small village, when Louis XIII. built here a hunting-seat, which Louis XIV. enlarged into a palace, in a forest ten leagues in circumference, which became a place of frequent residence of the royal family till the revolution. The palace is magnificent, with beautiful gardens, adorned with statues, canals, fountains, &c. and a park, five miles in circumference, surrounded with a wall. Since the revolution, it has been erected into a bishop's see: three posts SW. Paris. Long. 19. 48. E. Ferro. Lat. 48. 49. N.

VERSE, in poetry, a line consisting of a number of long and short syllables, which run with an agreeable cadence.

VERSE is also used for a part of a chapter, section, &c.

VERSIFICATION, the art or manner of making verse; also the tune and cadence of verse. See **POETRY**.

VERSION, a translation of some book or writing out of one language into another. See **TRANSLATION**.

VERT, in heraldry, the term for a green colour. It is called *vert* in the blazon of the coats of all under the degree of nobles; but in coats of nobility it is called *emerald*; and in those of kings *verus*. In engraving it is expressed by diagonals, or line drawn athwart from right to left, from the dexter chief corner to the sinister base.

VERTEBRÆ, in anatomy. See **ANATOMY**.

VERTEX, in anatomy, denotes the crown of the head. Hence vertex is also used figuratively for the top of other things: thus we say, the vertex of a cone, pyramid, &c.

VERTEX, is also used in astronomy for the point of the heaven directly over our heads, properly called the *zenith*.

VERTICILLATÆ, the name of a class in Ray's and Boerhaave's Methods, consisting of herbaceous vegetables, having four naked seeds, and the flowers placed in whorls round the stalk. The term is synonymous to the *labiati*, or lip-flowers of Tournefort; and is exemplified in mint, thyme, and Savory. Verticillate is also the name of the 42d order in Linnæus's Fragments of a Natural Method, consisting of plants which answer the above description.

VERTICILLUS, a mode of flowering, in which the flowers are produced in rings at each joint of the stem, with very short foot-stalks. The term is exemplified in mint, horehound, and the other plants of the natural order described above.

VERTICITY, is that property of the loadstone whereby it turns or directs itself to one particular point.

VERTIGO, in medicine. See **MEDICINE**.

VERTUMNUS, in mythology, a god who presided over gardens and orchards, honoured among the Etruscans, from whom the worship of this deity was transmitted to the Romans. Ovid has described the various forms assumed by this deity, in order to obtain the love of Pomona. Some have supposed that Vertumnus, whose name they derive a *vertendo*, because he had power to change his form at pleasure, marked the year and its variations; and thus they say he pleased Pomona, by bringing the fruits to maturity. Accordingly, Ovid says, that he assumed the form of a labourer, reaper, vine-dresser, and old woman, to represent the four seasons, spring, summer, autumn, and winter. Vertumnus had a temple near the market-place at Rome, being represented as one of the tutelary deities of the merchants. The commentators on Ovid say, that he was an ancient king of Hetruria, who, by his diligent and successful cultivation of fruits and gardens, obtained the honour of being ranked among the gods.

VERUMONTANUM, in anatomy, a small eminence near the passages where the semen is discharged into the urethra.

VERVAIN, in botany. See **VERBENA**.

VERTOT d'AUBOEF (Rene Aubert de), a celebrated historian, was descended from a noble and ancient family in Normandy, and born in 1655. At sixteen years of age, he became a Franciscan friar; afterwards he entered into the order of the Premonstratensians, in which he had several benefices; and at length was a secular ecclesiastic. He became secretary to the dukes of Orleans, member of the Academy of Inscriptions, and historiographer of Malta. He died at Paris in 1735. His principal works are: 1. The History of the Revolutions of Sweden. 2. The Revolutions of Portugal. 3. The Revolutions of the Romans. 4. The History of Malta. These works are written in elegant French, and translated into most of the languages of Europe.

VERULAM. See **BACON**.

VESALIUS (Andreas), a celebrated physician and anatomist, was born at Brussels about the year 1512. He studied physic at Paris under James Sylvius; but applied himself chiefly to anatomy, which was then very little known, dissections being esteemed unlawful and impious; and it appears from his work, *De humani corporis fabrica*, that he perfected himself in this useful knowledge very early. About the year 1537, the republic of Venice made him professor in the university of Padua, where he taught anatomy for seven years; Charles V. called him to be his physician, as he was also to Philip II. king of Spain. Vesalius was now at the height of his glory, when all of a sudden he formed the design of taking a journey to Palestine; concerning which journey we are told the following story. A young Spanish nobleman he attended, being believed to be dead, Vesalius obtained leave to open him to explore the true cause of his illness; but when he opened the breast, he perceived symptoms of life, and saw the heart beat. The parents, not satisfied with prosecuting him for murder, accused him of impety to the inquisition, in hopes that tribunal would punish him with greater rigour; but the king interposing, saved him on condition of his making a pilgrimage to the Holy Land. He was shipwrecked on his return, and thrown upon the island of Zante, where he perished, in 1564. He was the author of several works, the principal of which is that above mentioned.

VESICATORIUM, a BLISTER; an application of an acrid nature made to any part of the body, in order to draw a flux of humours to that part, and thus elevate the scarf-skin into a blister.

VESPA, the WASP: a genus of insects belonging to the order of hymenoptera. The mouth consists of two jaws without any proboscis; the superior wings are plaited; the eyes are lunar; and there is a sharp sting in the tail. There are 159 species; only three of which are natives of Britain, the *crabro*, the *vulgaris*, and the *coarctata*.

1. *Crabro*, the hornet. It has tawny antennæ; the segments of the abdomen are black on the anterior part and yellow on the posterior, with two black spots on each. Its length is an inch; it builds in hollow trees. Its cakes or combs are composed of a substance like coarse paper, or rusty parchment. It is very voracious, devouring other insects, and even bees.

2. *Vulgaris*, the common wasp. The male has seven yellow segments of the abdomen, with a black triangle on each: the head is yellow, and the antennæ long. The upper lip of the female is yellow, the antennæ short; there are six segments of the abdomen, with two lateral black spots on each. M. Reaumur and Dr. Derham agree in distinguishing three sorts of wasps; viz. the queens or females, the males, and the common labouring wasps, called *mules*, which, according to Reaumur, are neither males nor females, and consequently barren. The queens, of which there is a great number, are much longer in the body, and larger than any other wasp: they have a large heavy belly, corresponding in size to the prodigious quantity of eggs with which they are charged. The males are less than the queens, but longer and larger than the common wasps, which are the smallest of the species: they have no stings, with which both the queens and common wasps are furnished. There are in one nest two or three hundred males, and as many females: but their number depends on the size of the nest; and Dr. Derham observed, that the males were bred, or at least mostly reared, in the two cells or partings, between the combs, next to the uppermost cell. The antennæ or horns of the male wasps are longer and larger than those of either of the other sorts: but the chief difference, says Dr. Derham, consists in their parts of generation, which are altogether different from those of other wasps.

The mules are the labourers belonging to a nest, and are employed in procuring materials for the nests, and in constructing them, and also in furnishing the other wasps, and the young, with provisions.

At the beginning of winter, the wasps destroy all the eggs, and all the young ones without exception: all the mules and males, which have been employed in this work, being unfurnished with provisions, perish; and none survive except some few females, which, according to Reaumur, were fecundated in October, and raise a new colony in the beginning of spring. In spring a new commonwealth is founded by a single female impregnated during the autumn, and that has weathered out the severity of the winter. It digs a hole in a dry soil, contrives itself a sinuous inlet, or else it takes up with the dwelling place of a mole, where it hastily builds a few cells and deposits its eggs. Within the space of twenty days, they have gone through the different states of larvae, chrysalids, and turned to wasps. Nature all-wise provides for every thing. The mule-wasps are the only ones that labour at laying the foundation of the republic. The first eggs that are hatched prove to be neuter-wasps. No sooner are they come into existence, but they fall to work, enlarge the hole, and go about upon wood, lattice-work, and window sashes, in search of materials for building. With their teeth they cut, hack, and tear off small fibres of wood, which they moisten with a

liquor they disgorge, and then convey them to the work-shop. Other labourers are in waiting for them, who with those materials set about the construction of the wasp-nest, which is commonly round, and made of materials resembling fine paper. The common covering of it, which is formed of several leaves or layers, with intermediate spaces, is pierced by two holes at a distance from one another, one of which is used for the entrance of the wasps, and the other only for their exit. The space within this covering is cut by a number of horizontal planes, with intervals between them of the size of about half an inch; they are suspended from one another by ligaments, and attached to the covering by their edges: they all have hexagonal cells in their lower surface.

The eggs of the wasp are of an oblong form, and resemble those of a common fly, but they are larger; they are always fastened to the angles of a cell, never to the sides of it. They are usually placed single; it is very rare to find two in one cell; and, if they are laid so, it seems that only one succeeds; for there is never found more than one worm in a cell.

The heads of all the nymphs are turned toward the centre of the comb, and their tails go obliquely downward toward the base of the cell. They are continually seen opening their mouths, and moving their forceps, seeming ever hungry, and impatiently waiting for food from their parents. The cells are left open till the nymph is at its full growth; and then the wasps cover it over with a thin lid, under which the worm undergoes its transformation; and as soon as it is arrived at the wasp-state, it eats its way through this thin cover, and comes to work with the rest. The elder brothers, or first hatched insects, take amazing care of those born after them, by proportioning their food to the delicacy of their stomach. First, it consists of the juice of fruits and meats; afterwards it is the carcasses of insects. The caterers provide for the labourers. Each one takes his own portion; there is no dispute, no fighting. The republic grows daily more numerous, living in profound peace. Every individual, as soon as he has acquired sufficient strength, flies away to the fields. They then become a gang of banditti; they pillage our wall-trees, break into our fruit before its maturity, dart with the fierceness of hawks upon our bees, cut their throats to possess themselves of their honey, plunder and lay waste their commonwealth, riot on the fruits of their labour, and oblige them to remove. During the period of plenty, the wasps bring all the booty to the nest, and share it amongst them. There is nothing then goes forwards but feasting, rioting, and good fellowship; but concord cannot be lasting among robbers. Towards the month of October provisions begin to run short: the neuters and males tear from their cradles the eggs, the larvae, the chrysalids, and the new-born insects, without showing mercy to any. They next fight against one another. Frosts and rains throw the citizens into a state of languor, and they almost all perish, luckily for us and our bees, some few females alone excepted, which in the ensuing spring become founders of new republics.

3. *Coarctata*, the small wasp; has black antennæ, yellowish at the base; the head is black with a yellow spot between the antennæ, and another at the base of the upper lip. Each segment of the abdomen is bordered with yellow. It is about half an inch long. The history, as well as the manners of this species, are the same as those of the common wasp; but their buildings are on a different construction. Their nest is fastened to the branch of a tree with a kind of band; and is in bigness from the size of an orange down to that of an egg. Wood reduced to paper is the material part of it; which if it were of a ruddy colour, might be taken for a large opening rose. It is covered over with a varnish impenetrable

by water. One of those nests was neither mollified nor impaired by that element.

VESPASIAN, the tenth emperor of Rome; remarkable for his clemency and other virtues. See the Roman History.

VESPER, in the church of Rome, denotes the afternoon service; answering in some measure to the evening prayers of the church of England.

VESPERTILIO, the BAT; a genus of quadrupeds, belonging to the order of *primates*. All the teeth are erect, pointed, near each other; and the first four are equal. The fore-feet have the toes connected by a membrane expanded into a kind of wings by which the creature is enabled to fly. There are twenty-eight species, of which four are natives of Britain. The most remarkable are,

1. The *vampyrus*, vampire, or Ternate bat (see Pl. 1.) with large canine teeth; four cutting teeth above, the same below; sharp black nose; large naked ears; the tongue is pointed, terminated by sharp aculeated papillæ; talons very crooked, frong, and compressed sidewise; no tail: the membrane divided behind quite to the rump: head of a dark ferruginous colour; on the neck, shoulder, and under-side, of a much lighter and brighter red; on the back the hair shorter, dusky, and smooth: the membranes of the wings dusky. They vary in colour; some being entirely of a reddish brown, others dusky.

These monsters inhabit Guinea, Madagascar, and all the islands from thence to the remotest in the Indian Ocean. They fly in flocks, and perfectly obscure the air with their numbers; they begin their flight from one neighbouring island to another immediately on sunset, and return in clouds from the time it is light till sun-rise. They live on fruits; and are so fond of the juice of the palm-tree, that they will intoxicate themselves with it till they drop on the ground. It is most likely, from the size of their teeth, they are carnivorous. Mr. Edwards relates, that they will dip into the sea for fish. They swarm like bees; hanging by one another from the trees in great clusters. The Indians eat them, and declare the flesh to be very good: they grow exceedingly fat at certain times of the year. The French who live in the Isle de Bourbon boil them in their bouillon, to give it a relish. The negroes hold them in abhorrence. Many are of an enormous size: Beckman measured one, whose extent from tip to tip of the wings was five feet four inches; and Dampier another, which extended farther than he could reach with out-stretched arms. Their bodies are from the size of a pullet to that of a dove; their cry is dreadful, their smell rank, their bite, resistance, and fierceness, great when taken.

The ancients had some knowledge of these animals. Herodotus mentions certain winged wild beasts like bats, that molested the Arabs who collected the cassia, to such a degree, that they were obliged to cover their faces, all but their eyes, with skins. It is very probable, as M. de Buffon remarks, it was from such relations that poets formed their fictions of Harpies.

Linnaeus gives this species the title of *vampyre*; conjecturing it to be the kind which draws blood from people in their sleep. M. de Buffon denies it; ascribing that faculty only to a species found in South America. But there is reason to imagine that this thirst after blood is not confined to the bats of one continent nor to one species: for Bontius and Nieuhoff informs us, that the bats of Java seldom fail of attacking persons who lie with their feet uncovered, whenever they can get access; and Gumilla, after mentioning a greater and less species found on the banks of the Oronoque, declares them to be equally greedy after human blood. Persons thus attacked have been known to be near passing from a sound sleep into

eternity. The bat is so dexterous a bleeder, as to infuse its aculeated tongue into a vein without being perceived, and then suck the blood till it is fatiated; all the while fanning with its wings, and agitating the air in that hot climate in so pleasing a manner, as to fling the sufferer into a still sounder sleep. It is therefore very unsafe to rest either in the open air, or to leave open any entrance to these dangerous animals: but they do not confine themselves to human blood; for M. Condamine says, that in certain parts of America they have destroyed all the great cattle introduced there by the missionaries.

2. The *spectrum*, or spectre, with a long nose; large teeth; long, broad, and upright ears: at the end of the nose a long conic erect membrane, bending at the end, and flexible: hair on the body cinereous, and pretty long: wings full of ramified fibres: the membrane extends from hind leg to hind leg: no tail; but from the rump extend three tendons, terminating at the edge of the membrane. By Seba's figure the extent of the wings are two feet two inches; from the end of the nose to the rump, seven inches and an half. Inhabits South America; lives in the palm-trees; grows very fat; called *vampyre* by M. de Buffon, who supposes it to be the species that sucks the human blood: but neither Piso, nor any other writer who mentions the fact, gives the least description of the kind.

3. The *Peruvian* bat hath a head like a pug dog; large straight-pointed ears; two canine teeth, and two small cutting teeth between each, in each jaw: the tail is inclosed in the membrane which joins to each hind-leg, and is also supported by two long cartilaginous ligaments involved in the membrane: colour of the fur, iron grey: body equal to that of a middle-sized rat: extent of the wings two feet five inches.

4. The *noctule* hath the nose slightly bilobated; ears small and rounded; on the chin a minute verruca; hair reddish ash-colour; length of the rump two inches eight-tenths; tail one inch seven-tenths; extent of wings thirteen inches. Inhabits Great Britain and France; flies high in search of food, not skimming near the ground. A gentleman informed Mr. Pennant of the following fact relating to those animals, which he was witness to: that he saw taken under the eaves of Queen's College, Cambridge, in one night, 185; the second night, sixty-three; the third night, two; and that each that was measured had fifteen inches extent of wings.

5. The *marinus*, common bat; has a tail: the lips and nose are simple; and the ears are smaller than the head. It inhabits Europe, and is found in Britain. This animal flies only during the night, living chiefly on moths: when it lights on the ground it is unable to rise again till it has crawled to some height: it remains torpid during winter, revives in the beginning of the spring, and comes abroad in the dusk of the evening. This species is two inches and a half long, when full grown, and about nine inches in extent; the fur is of a mouse-colour, tinged with reddish; it generally skims near the ground, with an uneven jerking flight; and often seeking for gnats and other aquatic insects, flies close by the surface of water. It breeds in the summer season, and is preyed on by owls.

Bats are very voracious, if proper food is to be had; and though moths and other insects be their natural and common food, yet if flesh, whether raw or roasted, fresh or corrupted, comes in their way, they devour it with greediness. In this country they appear abroad early in the spring, flying about only in the evenings; but are sometimes roused from their torpidity by a warm day or two during winter, and will then venture out in quest of food, but recommence their state of hybernation whenever the cold returns: they retire at the end

of summer into caves, ruined houses, or the roofs and caves of houses, where they remain suspended by the hind legs, and enveloped in their wings, generally in large numbers. Bats may be caught by means of the flower cups of bur-dock, whitened and thrown up in the way of their flight; they are attracted by the whiteness, and the hooks of the bur, sticking to their membranous wings, make them fall to the ground.

VESSEL, a general name given to the different sorts of ships which are navigated on the ocean, or in canals and rivers. It is, however, more particularly applied to those of the smaller kind, furnished with one or two masts. See SHIP.

VESTA, in pagan worship, the same with Cybele. See CYBELE.

VESTA the Younger, in pagan worship, the goddess of Fire, was the daughter of Saturn and Cybele, and the sister of Ceres. She was so much in love with chastity, that on Jupiter's ascending the throne and offering to grant whatever she asked, she only desired the preservation of her virginity, which she obtained.—Vesta was not represented in her temple by any image.

VESTALIA, in Roman antiquity, a festival celebrated in honour of the goddess Vesta, on the 5th of the ides of June; that is, on the ninth of the month.

VESTALS, among the ancient Romans, were priestesses of the goddess Vesta, and had the perpetual fire committed to their charge: they were at first only four in number, but afterwards increased to fix; and it does not appear that their number ever exceeded six, among whom was one superior to the rest, and called *vestalis maxima*. The vestals were chosen from six to ten years of age, and obliged to strict continency for thirty years; the first ten of which were employed in learning the ceremonies of religion, the next ten in the performance of them, and the ten last in teaching them to the younger vestals. The habit of the vestals consisted of an head-dress, called *infula*, which sat close to the head, and from whence hung certain laces called *vitta*: a kind of surplice made of white linen, and over it a purple mantle with a long train to it.

VESTIBLE, in architecture, a kind of entrance into a large building; being an open place before the hall, or at the bottom of the staircase.

VESTRY, a place adjoining to a church, where the vestments of the minister are kept; and also a meeting at such place, consisting of the minister, church-wardens, and chief men of most parishes, who make a parish vestry or meeting. By custom there are select vestries, being a certain number of persons chosen to have the government of the parish, make rates, and take the accounts of church-wardens, &c.

VESUVIUS, a volcanic mountain of Italy, in the kingdom of Naples, remarkable for its eruptions, recorded both in ancient and modern history. One which happened in the seventy-ninth year of the christian æra, overwhelmed the cities of Herculaneum and Pompeia, when the elder Pliny lost his life. The principal eruptions of modern times, which have been recorded, happened in the years 1538, 1631, 1707, 1717, 1737, 1760, 1761, 1766, 1767, 1779, and 1794; of these, the first in 79, in 1631, and the last in 1794, appear to have been the most tremendous. In the year 1794, the mischief was considerable: the lava covered, and totally destroyed, 5000 acres of rich vineyards and cultivated land, and drove the inhabitants of Torre del Greco from the town, most of the houses being either buried, or so injured, as to be uninhabitable: the damage done to the vineyards by the ashes likewise was immense: seven miles east of Naples. See VOLCANO, and (in the SUPPLEMENT) ÆTNA.

VETCH, in botany. See VICTA.

VETERAN, among the ancient Romans, an appellation given to a *soldier* grown old in the service, or who had made a certain number of campaigns.

VETERINARY ART. See FARRIERY.

VEXILLUM, in botany; the upper petal of a pea-bloom, or butterfly-shaped flower, which is generally larger than any of the others.

VIALES, in mythology, a name given among the Romans to the gods who had the care and guard of the roads and highways.

VIATICUM, in Roman antiquity, an appellation given in common to all officers of any of the magistracies, as *licitors*, *accensi*, *scribes*, *criers*.

VIBEX, is sometimes used, by physicians, for a black and blue spot in the skin occasioned by an afflux or extravasation of blood.

VIBRATION, in mechanics, a regular, reciprocal motion of a body, as a pendulum.

VIBURNUM, in botany: a genus of plants of the class *pentandria*, order *trigynia*, and in the natural system arranged under the 43d order, *Dunoglr*. The calyx is quinquepartite and above; the corolla divided into five laciniæ; the fruit a monoepermous berry. There are 19 species; two of which, the *lantana* and *opulus*, are natives of Britain. 1. The *lantana*, common viburnum, wayfaring, or plant mealy tree, rises with a woody stem, branching twenty feet high, having very pliant shoots covered with a lightish-brown bark; large heart-shaped, veined, serrated leaves, white and hoary underneath; and the branches terminated by umbels of white flowers, succeeded by bunches of red berries, &c. 2. The *opulus*, or gelder rose; consisting of two varieties, one with flat flowers, the other globular. The former grows eighteen or twenty feet high, branching opposite, of an irregular growth, and covered with a whitish bark; large lobated or three-lobed leaves on glandulose foot-stalks, and large flat umbels of white flowers at the ends of the branches, succeeded by red berries. The latter grows fifteen or eighteen feet high, branching like the other, garnished with large lobated or three-lobed leaves, on glandular footstalks; and large globular umbels of white flowers at the ends of the branches, in great abundance. This tree when in bloom exhibits a singularly fine appearance; the flowers, though small, are collected numerously into large globular umbels round like a ball; hence it is sometimes called *snow-ball-trees*. 3. The *tinus*, common laurustinus, or evergreen viburnum; grows eight or ten feet high or more, branching numerously from the bottom upwards, assuming a close bushy growth, with the branches somewhat hairy and glandulous; very closely garnished with oval, wholly entire leaves, of a strong green colour, placed in pairs opposite; and whitish and red flowers, collected numerously in large umbellate clusters all over the plant, at the sides and ends of the branches, from January until March or April, exhibiting a most beautiful appearance. There are a great many varieties. All the different species of viburnum, both deciduous and evergreen kinds, being of the tree kind, are woody and durable in root, stem, and branches. They may all be propagated by layers; and are of such hardy temperature, as to grow freely in the open ground all the year, in shrubberies, and other hardy plantations.

VICAR, a person appointed as deputy to another, to perform his functions in his absence, and under his authority.

VICAR, in the canon-law, denotes a priest of a parish, the predial tithes whereof are impropriated or appropriated; that is, belong either to a chapter, religious house, &c. or to a layman who receives them, and only allows the vicar the

small tithes, or a convenient salary. See the article *PARSON* and *Vicar*.

VICE, in ethics, is ordinarily defined an elective habit, denoting either an excess or defect from the just medium wherein virtue is placed.

VICE, in smithery and other arts conversant in metals, a machine or instrument serving to hold fast any thing they are at work upon, whether it is to be beat, filed, or rivetted.

VICE is also used in the composition of divers words to denote the relation of something that comes instead or in the place of another; as vice-admiral, vice-chancellor, &c. are officers who take place in the absence of admirals, &c.

VICEROY, a governor of a kingdom, who commands in the name and instead of a king, with full and sovereign authority.

VICIA, in botany: a genus of plants of the class *diadelphia*, and order of *decandria*; and in the natural system arranged under the 32d order, *Papilionacea*. The stigma is bearded transversely on the lower side. There are 20 species, seven of which are natives of Britain. The most important of these are, 1. The *fatia*, common vetch, or tare. The stalks are round, weak, branched, about two feet long. Pinnæ five or seven pair, a little hairy, notched at the end. Stipulæ dentated. Flowers light and dark purple, on short pedicles, generally two together; pods erect; seeds black. It is known to be an excellent fodder for horses. 2. The *cracca*, tufted vetch. It has a stem branched, three or four feet long. Leaves pinnated; pinnæ generally ten or twelve pairs, lance-shaped, downy. Stipulæ entire. Flowers purple, numerous, pendulous, in imbricated spikes. It is also reckoned an excellent fodder for cattle. 3. The *faba*, or common garden bean. It is a native of Egypt. It is too well known to require description.

VICTIM, denotes a sacrifice offered to some deity, of a living creature, as a man or beast, which is slain to appease his wrath, or to obtain some favour.

VICTOR (Sextus Aurelius), a Roman historian, who flourished under the emperors Constantine and Julian; as we learn from many passages in his own writings, and also from Ammianus Marcellinus. This historian relates, that Constantine made him consul, and honoured him with a brazen statue, on account of his excellent qualifications; although, as he owns of himself, he was born in an obscure village, and of poor and illiterate parents. It is commonly believed that he was an African: it is certain, that he dwells much upon the praises of that country, which he calls the glory of the earth; *decus terrarum*. Two books of his are extant in the historical way: one, *De viris illustribus urbis Romæ*; the other, *De Casaribus*; to which is prefixed *Libellus de origine gentis Romanæ*. The whole makes an abridged history of Rome, from its foundation down to the reign of Julian inclusive.

VICTORY, in pagan worship, is represented by Hædod as the daughter of Styx and Pallas; and Varro calls her the daughter of Heaven and Earth. The Romans erected a temple to her, where they prayed to the gods to give success to their arms. They painted her in the form of a woman, clad in cloth of gold. In some medals, she is represented with wings flying through the air, holding a laurel crown in one hand, and a palm in the other; but in other medals, she is seen standing upon a globe, with the same crown and branch of palm.

VIDA (Marcus Hieronymus), bishop of Alva, in Mount-ferrat, and one of the most excellent Latin poets that have appeared since the Augustan age, was born at Cremona in 1470. Having distinguished himself by his learning and taste for literature, he was made bishop of Alva in 1552. After

continuing two years with Pope Clement VII. at Rome; he went to reside upon his see; where, for thirty years, he performed all the offices of a good bishop and a good man; and though he was mild, gentle, and full of goodness, he was so far from wanting spirit, that when the city of Alva was besieged by the French, he used all possible means to prevent its being given up, by strenuously exhorting the people, and, when provisions were scarce, by supplying them at his own expence. His poetics, and poem on the silk-worm, pass for his masterpiece; his poem on the game of chess is also greatly admired. He also wrote hymns, eclogues, and a poem entitled *Christados*, in six books; all which are in Latin, and have gained him a great reputation. His works in prose consist of dialogues, synodical constitutions, letters, and other pieces. He died in 1566, soon after his being made bishop of Cremona.

VIENNA, the capital of the circle of Austria, in Germany, and of the whole German empire, is the place where the emperor resides. The city itself is not of very great extent; nor can it be enlarged, it being limited by a very strong fortification; but it is very populous. The streets, in general, are narrow, and the houses built high. Some of the public buildings are magnificent; but they appear externally to no great advantage, on account of the narrowness of the streets. The chief of them are the imperial palace, the library, and the museum; the palaces of the princes Lichtenstein, Eugene, &c. Vienna was twice ineffectually besieged by the Turks; namely, in 1589 and 1683. At the latter period, the siege was raised by John Sobieski, king of Poland, who totally defeated the Turkish army before the walls of this place. There is no great danger that Vienna will ever again be subject to the inconveniences of a siege. Yet, in case this should happen, a measure has been taken, which will prevent the necessity of destroying the suburbs; namely, no houses without the walls are allowed to be built nearer to the glacis than 600 yards; so that there is a circular field of that breadth all round the town, which, exclusive of the advantage above mentioned, has a very beautiful and salutary effect. These magnificent suburbs, and the town together, are said to contain above 300,000 inhabitants; yet the former are not near so populous, in proportion to their size, as the town; because many houses in the suburbs have extensive gardens belonging to them, and many families, who live during the winter within the fortifications, spend the summer in the suburbs. The cathedral is built of free-stone, is 114 yards long, and forty-eight broad, and the steeple is 447 feet high. Instead of a weather-cock there was a Turkish crescent, in memory of the siege in 1589; but after the second siege in 1683, they changed it for a golden cross, which three months after was thrown down by a storm. At present there is a black spread eagle, over which is a gilded cross. Joining to this church is the archbishop's palace, the front of which is very fine. The university had several thousand students, who, when this city was besieged, mounted guard, as they did also in 1741. Besides this, there is the academy of Lower Austria; and the archducal library is much frequented by foreigners, as it contains above 100,000 printed books, and 10,000 manuscripts. The academy of painting is remarkable for the fine pictures it produces. The archducal treasury, and a cabinet of curiosities of the house of Austria, are great rarities. The inhabitants, in general, live in a splendid manner; and people of distinction have all sorts of wines at their tables, which they are very free with to foreigners. There is a fort of harbour on the Danube, where there are magazines of naval stores, and ships have been fitted out to serve on that river against the Turks. Vienna is an archbishop's see. It is seated

at the place where the river Vienna, or Wien, falls into the Danube, thirty miles west of Presburgh, 350 north-north-east of Rome, 520 south-east by south of Amsterdam, 565 east of Paris, and 680 east-south-east of London. E. Long. 16. 28. N. Lat. 48. 13.

VIGIL, in church-history, is the eve or next day before any solemn feast; because then Christians were wont to watch, fast, and pray in their churches.

VIGILS of Plants, a term under which botanists comprehend the precise time of the day in which the flowers of different plants open, expand, and shut. As all plants do not flower in the same season, or month; in like manner, those which flower the same day, in the same place, do not open and shut precisely at the same hour. Some open in the morning, as the lip-flowers, and compound flowers with flat spreading petals; others at noon, as the mallows; and a third let in the evening, or after sun-set, as some geraniums and opuntias: the hour of shutting is equally determined. Of those which open in the morning, some shut soon after, while others remain expanded till night.

The hours of opening, like the time of flowering, seem to vary, according to the species of the plant, the temperature of the climate, and that of the season. Flowers, whose extreme delicacy would be hurt by the strong impressions of an ardent sun, do not open till night; those which require a moderate degree of heat to elevate their juices; in other words, whose juices do not rise but in the morning or evening, do not expand till then; whilst those which need a more lively heat for the same purpose, expand at noon, when the sun is in his meridian strength. Hence it is, that the heat of the air being greater betwixt the tropics than elsewhere, plants which are transported from those climates into the cold or temperate climates of Europe, expand their flowers much later than in their native soil. Thus, a flower which opens in summer at six o'clock in the morning at Senegal, will not open at the same season in France and England till eight or nine, nor in Sweden till ten.

Linnæus distinguishes by the general name of *solar* (*flores solares*) all those flowers which observe a determinate time in opening and shutting. These flowers are again divided, from certain circumstances, into three species, or kinds:

Equinoctial flowers (*flores æquinoxiales*) are such as open or shut at all seasons, at a certain fixed or determinate hour.

Tropical flowers (*flores tropicæ*) are such whose hour of opening is not fixed at all seasons, but accelerated or retarded according as the length of the day is increased or diminished.

Meteorous flowers (*flores meteoricæ*) are such whose hour of expansion depends upon the dry or humid state of the air, and the greater or less pressure of the atmosphere. Of this kind is the Siberian fow-thistle, which shuts at night if the ensuing day is to be clear and serene, and opens if it is to be cloudy and rainy. In like manner the African marigold, which in dry or serene weather opens at six or seven in the morning, and shuts at four o'clock in the afternoon, is a sure indication that rain will fall during the course of the day, when it continues that after seven.

VIGO, a sea-port town of Spain, in Galicia, with an 'old castle and a fort. It is seated in a fertile country by the sea-side. It was rendered famous by a sea-fight between the confederate fleet commanded by Sir George Rook, and a squadron of French men-of-war, while the Duke of Ormond with a body of land-forces drove the Spaniards from the castles which defended the harbour. Admiral Hopson having with infinite danger broke through the boom made across the mouth of the harbour, the English took four galleons and five large men-of-war, and the Dutch five galleons and one man-of-war. Four

galleons, with fourteen men-of-war, were destroyed, with abundance of plate and other rich effects. W. Long. 8. 21. N. Lat. 42. 3.

VILLA FRANCA, the name of several towns; one in Piedmont, three miles east of Nice; another of Catalonia, eighteen miles west of Barcelona; a third, the capital of St. Michael, one of the Azores; and a fourth, a town of Efremadura in Spain, fifty-seven miles south-east of Salamanca.

VILLAGE, an assemblage of houses inhabited chiefly by peasants and farmers, and having no market, whereby it is distinguished from a town. The word is French, formed of *vil*, or *vilis*, "low, mean, contemptible;" or rather, from the Latin *villa*, a country-house or farm.

VILLAIN, or **VILLEIN**, in our ancient customs, denotes a man of servile or base condition, viz. a bond-man or servant.

VILLARS (Lewis Hector duke de), marshal of France, grandee of Spain, &c. and a very brave general, was the son of Peter marquis de Villars, of a noble and ancient family. He was at first aid-de-camp to Marshal de Bellefons, his cousin; and distinguished himself in several sieges and battles till the year 1702, when having obtained the victory at Fredlingham from the Prince of Baden, he was made marshal of France. The marshal de Villars took the fort of Kell the year following, and gained a battle at Hochstet in concert with the Elector of Bavaria. In 1707 he forced the lines of Stolhoffen, and raised large contributions from the enemy: but in 1709, he, in conjunction with Marshal Bouffers, was entirely defeated by the Duke of Marlborough, at the battle of Malplaquet, when Marshal Villars was wounded at the beginning of the action. In 1712 he gained much glory by forcing the intrenchments at Denain on the Scheld; which was followed by the taking of Marchiennes, Douay, Bouchain, Landau, Friburg, &c. and by the peace concluded at Rastatt, between the emperor and France in 1714. The Marshal de Villars, who had been plenipotentiary at the treaty of Rastatt, was made president of the council of war in 1715, then counsellor of the regency, and minister of state. In 1733 he was nominated to command in Italy under the King of Sardinia, and the French king declared him marshal general of his camps and armies; a title which had not been granted to any one since the Marshal Turenne, who appears to have been the first who was ever honoured with it. The Marshal de Villars made himself master of Pishgirona, Milan, Novara, and Tortona. But having opened the following campaign, he fell sick, and died at Turin, in 1734, aged eighty-two. The Memoirs of M. de Villars have been published in Holland, the first volume of which was written by himself.

VILLENAGE, in law. The folk-land or estates held in villenage, was a species of tenure neither strictly feudal, Norman, or Saxon; but mixed and compounded of them all; and which also, on account of the heriots that usually attend it, may seem to have somewhat Danish in its composition. Under the Saxon government there were, as Sir William Temple speaks, a sort of people in a condition of downright servitude, used and employed in the most servile works, and belonging, both they, their children, and effects, to the lord of the soil, like the rest of the cattle or stock upon it. These seem to have been those who held what was called the *folk-land*, from which they were removeable at the lord's pleasure. On the arrival of the Normans here, it seems not improbable, that they, who were strangers to any other than a feudal state, might give some sparks of enfranchisement to such wretched persons as fell to their share, by admitting them, as well as others, to the oath of fealty; which conferred a right of protection, and raised the tenant to a kind of estate superior to

downright slavery, but inferior to every other condition. This they called *villengage*, and the tenants *villains*.

These villains, belonging principally to lords of manors, were either villains *regardant*, that is, annexed to the manor or land; or else they were in *grafs*, or at large, that is, annexed to the person of the lord, and transferable by deed from one owner to another. They could not leave their lord without his permission; but, if they ran away, or were purloined from him, might be claimed and recovered by action, like beasts or other chattels. They held indeed small portions of land by way of sustaining themselves and families: but it was at the mere will of the lord, who might dispossess them whenever he pleased; and it was upon villain services, that is, to carry out dung, to hedge and ditch the lord's demesnes, and any other the meanest offices: and their services were not only base, but uncertain both as to their time and quantity.

A villain could acquire no property either in lands or goods: if he purchased either, the lord might seize them to his own use: unless he contrived to dispose of them again before the lord had seized them, for the lord had then lost his opportunity.

In many places also a fine was payable to the lord, if the villain presumed to marry his daughter to any one without leave from the lord: and, by the common law, the lord might also bring an action against the husband for damages in thus purloining his property. For the children of villains were also in the same state of bondage with their parents; whence they were called in Latin *nativi*, which gave rise to the female appellation of a villain, who was called a *neise*. In case of a marriage between a freeman and a wife, or a villain and a freewoman, the issue followed the condition of the father, being free if he was free, and villain if he was villain; contrary to the maxim of the civil law, that *partus sequitur ventrem*. But no bastard could be born a villain, because by another maxim of our law he is *nullius filius*; and as he can gain nothing by inheritance, it was hard that he should lose his natural freedom by it. The law, however, protected the persons of villains against atrocious injuries of the lord: for he might not kill or maim his villain; though he might beat him with impunity.

Villains might be enfranchised by manumission. In process of time they gained considerable ground on their lords; and in particular strengthened the tenure of their estates to that degree, that they came to have in them an interest in many places full as good, in others better than their lords. For the good-nature and benevolence of many lords of manors having, time out of mind, permitted their villains and their children to enjoy their possessions without interruption, in a regular course of descent, the common law, of which custom is the life, now gave them title to prescribe against their lords: and, on performance of the same services, to hold their lands, in spite of any determination of the lord's will. For though in general they are still said to hold their estates at the will of the lord, yet it is such a will as is agreeable to the custom of the manor; which customs are preserved and evidenced by the rolls of the several courts-baron in which they are entered, or kept on foot by the constant immemorial usage of the several manors in which the lands lie. And as such tenants had nothing to show for their estates but these customs, and admissions in pursuance of them, entered on those rolls, or the copies of such entries witnessed by the steward, they now began to be called *tenants by copy of court-roll*, and their tenure itself a *copyhold*.

Privileged VILLENAGE, a species of tenure otherwise called *villain-tenage*. See **TENURE**. Ancient demesne consists of those lands or manors which, though now perhaps granted out to private subjects, were actually in the hands of the crown

in the time of Edward the Confessor, or William the Conqueror; and so appear to have been, by the great survey in the exchequer, called *doomday-book*. The tenants of these lands, under the crown, were not all of the same order or degree. Some of them, as Britton testifies, continued for a long time pure and absolute villains, dependent on the will of the lord; and common copyholders in only a few points. Others were in a great measure enfranchised by the royal favour; being only bound in respect of their lands to perform some of the better sort of villain-services: but those determinate and certain; as, to plough the king's land for so many days, to supply his court with such a quantity of provisions, and the like; all of which are now changed into pecuniary rents: and in consideration hereof they had many immunities and privileges granted to them; as, to try the right of their property in a peculiar court of their own, called a *court of ancient demesne*, by a peculiar process denominated a writ of right close: not to pay toll or taxes; not to contribute to the expenses of knights of the shire; not to be put on juries, and the like.

These tenants therefore, though their tenure be absolutely copyhold, yet have an interest equivalent to a freehold: for though their services were of a base and villenous original, yet the tenants were esteemed in all other respects to be highly privileged villains; and especially for that their services were fixed and determinate, and that they could not be compelled (like pure villains) to relinquish those tenements at the lord's will, or to hold them against their own: *et ideo* (says Bracton) *dicuntur liberi*.

Lands holding by this tenure are therefore a species of copyhold, and as such preserved and exempted from the operation of the statute of Charles II. Yet they differ from common copyholds, principally in the privileges before mentioned; as also they differ from freeholders by one especial mark and distinction of villenage, noted by Bracton, and remaining to this day; viz. that they cannot be conveyed from man to man by the general common-law conveyances of feoffment, and the rest; but must pass by surrender to the lord or his steward, in the manner of common copyholds; yet with this difference, that, in the surrenders of these lands in ancient demesne, it is not used to say, "to hold at the will of their lord," in their copies; but only, "to hold according to the custom of the manor."

VILLI, among botanists, a kind of down like short hair, with which some trees abound.

VILLIERS (George duke of Buckingham), an ingenious and witty nobleman, whose mingled character rendered him at once the ornament and disgrace, the envy and ridicule, of the court he lived in, was son to that famous statesman and favourite of king Charles I. who lost his life by the hands of lieutenant Felton. He was born in 1637, the year before the fatal catastrophe of his father's death. The early parts of his education he received from various domestic tutors, after which he was some time at the university of Cambridge.

As to his personal character, it is impossible to say any thing in its vindication; for though his severest enemies acknowledge him to have possessed great vivacity and a quickness of parts peculiarly adapted to the purposes of ridicule, yet his warmest advocates have never attributed to him a single virtue. His generosity was profane, his wit malevolence, the gratification of his passions his sole aim through life, his very talents caprice, and even his gallantry the mere love of pleasure. But it is impossible to draw his character with equal beauty, or with more justice, than in that given of him by Dryden, in his *Abdalom* and *Achitophel*, under the name of *Zimri*, to which the reader is referred.

As a **WRITER**, however, he stands in a quite different point

of view. There we see the wit, and forget the libertine.—His poems, which indeed are not very numerous, are capital in their kind; but what will immortalize his memory while language shall be understood, or true wit relished, is his celebrated comedy of *The Rehearsal*.

VILLOSE, or VILLOUS, something abounding with villi or fibres like short hair; such is one of the coats of the stomach.

VINCA, in botany: a genus of plants of the class *pentandria*, and order of *monogynia*; and in the natural system arranged under the 30th order, *Contortæ*. The corolla is twisted; there are two erect foliicles; the seeds are naked. There are five species; only two of which are natives of Britain: 1. The *major*, great periwinkle. It has a woody, erect stem; leaves broader and sharper pointed; pedicles of the flowers straight, and calyx as long as the tube; otherwise like the former. 2. The *minor*, small periwinkle, has a woody, creeping, slender, crooked stem; leaves long, oval, entire, pointed, opposite, glossy. Flowers single, on long curved pedicles from the axæ of the leaves, which are large and blue.

ST. VINCENT, an island in the West Indies, about forty miles in length, and ten in breadth. This island was only inhabited by native Caribbs till, in the latter part of the last century, a ship from Guinea, with a large cargo of slaves, was either wrecked or run ashore upon the island of St. Vincent, into the woods and mountains of which great numbers of the negroes escaped, whom the Indians suffered to remain. Partly by the accession of runaway slaves from Barbadoes, and partly by the children they had by the Indian women, these Africans became very numerous; so that about the beginning of the last century they constrained the Indians to retire into the north-west part of the island. These people, as may be reasonably supposed, were much dissatisfied with this treatment; and complained of it occasionally both to the English and to the French, that came to wood and water amongst them. The latter at length suffered themselves to be prevailed upon to attack these invaders. After much deliberation, in the year 1719, they came with a considerable force from Martinico, and landing without much opposition, began to burn the negro huts, and destroy their plantations, supposing that the Indians would have attacked them in the mountains, which if they had done, the blacks had probably been extirpated, or forced to submit, and become slaves. But either from fear or policy, the Indians did nothing, and the negroes falling in the night, and retreating to inaccessible places in the day, destroyed to many of the French (amongst whom was Mr. Paulian, major of Martinique, who commanded them), that they were forced to retire. When by this experiment they were convinced that force would not do, they had recourse to fair means, and by dint of persuasions and presents, patched up a peace with the negroes as well as the Indians, from which they received great advantage. Things were in this situation, when captain Uring came with a considerable armament to take possession of St. Lucia and this island, in virtue of a grant from King George I. to the Duke of Montague. When the French had dislodged this gentleman, by a superior force from St. Lucia, he sent Captain Braithwaite to try what could be done at the island of St. Vincent, in which he was not at all more successful. After this the country became a theatre of savage hostilities between the negroes and the Charaibes; in which it is believed that the former were generally victorious; it is certain that they proved so in the end, their numbers, in 1763, being computed at 2000; whereas of the red or native Charaibes, there were not left more than 100 families, and most of these are by this time said to be exterminated. It is, however, worthy of remark, that the African intruders have adopted most of the Charaibeian man-

ners and customs; among the rest, the practice of flattening the foreheads of their infants; and, perhaps, it was chiefly from this circumstance that they acquired the appellation of the black Charaibes. St. Vincent being ceded to the English by the peace of Paris, in the year 1763, the first measure of the English government was to dispose of the lands, without any regard to the claims of the Charaibes of either race; which in truth, were considered as of no consequence or validity. This gave rise to a war with the Charaibes, in the course of which, it became the avowed intention of government to exterminate those miserable people altogether, or by conveying them to a barren island on the coast of Africa, consign them over to a lingering destruction. By repeated protests and representations from the military officers employed in this disgraceful business, and the dread of parliamentary enquiry, administration at length thought proper to desist, and the Charaibes after surrendering part of their lands, were permitted to enjoy the remainder unmolested. On the 10th of June 1779, St. Vincent shared the common fate of most of the British West-Indian possessions, in that unfortunate war with America, which swallowed up all the resources of the nation, being captured by a small body of troops from Martinico, consisting of only 450 men, commanded by a lieutenant in the French navy. It contained at that time sixty-one sugar estates, 500 acres in coffee, 200 acres in cacao, 400 in cotton, 50 in indigo, and 500 in tobacco, besides land appropriated to the raising provisions, such as plantains, yams, maize, &c. All the rest of the country, excepting the few spots that had been cleared from time to time by the Charaibes, retained its native woods. St. Vincent contains about 84,000 acres, which are everywhere well watered, but the country is very generally mountainous and rugged; the intermediate valleys, however, are fertile in a high degree, the soil consisting chiefly of a fine mould, composed of sand and clay, well adapted for sugar. The extent of country at present possessed by British subjects is 23,605 acres, and about as much more is supposed to be held by the Charaibes. All the remainder is thought incapable of cultivation or improvement. The governor's salary is 2000l. sterling, one half of which is raised within the island, the other half is paid him out of the exchequer of Great Britain. The number of inhabitants appears, by the last returns to government, to be 1450 whites, and 11,853 negroes. During the present war, the Caribs revolted; and, assisted by the French, spread desolation over the whole island. By the exertions of the governor, however, and the British forces in the West Indies, the revolt is in a great measure quelled, though it will be long before things are restored to their former state. Long 61. W. Greenwich. Lat. 13. 10. N.

VINCI (Leonardo da), an illustrious Italian painter, descended from a noble Tuscan family, was born in the castle of Vinci near Florence in 1445. He was placed under Andrea Verocchio, a celebrated painter in that city; but soon surpassed him and all his predecessors so much, as to be reputed the master of the third or golden age of modern painting. But his studies were far from terminating here; no man's genius was more universal; he applied himself to arts, to literature, and to the accomplishments of the body; and he excelled in every thing which he attempted. Lewis Sforza duke of Milan prevailed on him to be director of the academy for architecture he had just established; where Leonardo soon banished all the Gothic fashions, and reduced every thing to the happy simplicity of the Greek and Roman style. By the duke's order, he constructed the famous aqueduct that supplies the city of Milan with water: this canal goes by the name of *Mortefiana*, being above 200 miles in length, and conducts the water of the river Adda quite to the walls of the city. In 1479 he was desired to construct some new device for the

entertainment of Louis XII. of France, who was then to make his entrance into Milan. Leonardo accordingly made a very curious automaton in the form of a lion, which marched out to meet the king, reared up on its hinder legs before him, and opening its breast, displayed an escutcheon with fleurs de lys quartered on it. The disorders of Lombardy, with the misfortunes of his patrons the Sforzi, obliging Leonardo to quit Milan, he retired to Florence, where he flourished under the Medici; here he raised the envy of Michael Angelo, who was his contemporary; and Raphael, from the study of his works, acquired his best manner of designing. At length, on the invitation of Francis I. he removed to France when above 70 years of age; where the journey and change of climate threw him into his last sickness: he languished for some months at Fontainebleau, where the King came frequently to see him; and one day rising up in his bed to acknowledge the honour done him, he fainted, and Francis supporting him, Leonardo died in his arms. His death happened in 1520. Some of his paintings are to be seen in England and other countries, but the greatest part of them are in Florence and France. He composed a great number of discourses on curious subjects; but none of them have been published but his treatise on the Art of Painting.

VINCULUM, in algebra, a character in form of a line, or stroke drawn over a factor, divisor, or dividend, when compounded of several letters or quantities to connect them, and shews that they are to be multiplied or divided, &c. together by the other terms.

Thus $d \times a + b - c$ shews that d is to be multiplied into $a + b - c$.

VINE, in botany. See VITIS.

VINEGAR, ACETUM, an agreeable acid and penetrating liquor, prepared from wine, cyder, beer, and other liquors; of considerable use, both as a medicine and a sauce. The word is French, *vinaigre*; formed from *vin*, "wine;" and *aigre*, "sour." See ACETUM, and CHEMISTRY.

The process indicated by Boerhaave for making vinegar is still the most frequently used. It consists in fixing two casks in a warm room or place. Two false bottoms of basket-work are fixed at a certain distance from the bottom, upon which the refuse of grapes and vine twigs are placed. One of these tuns is filled with wine, and the other only half filled. The fermentation begins in this last: and, when it is in full action, it is checked by filling the cask up with wine out of the other. The fermentation then takes place in the last mentioned cask, that remained half filled; and this is checked in the same manner by pouring back the same quantity of liquid out of the other: and in this way the process is continued till the vinegar is made, which is usually in about 15 days. When the fermentation develops itself, the liquid becomes heated and turbid: a great number of filaments are seen in it; it emits a lively smell; and much air is absorbed, according to the observation of the Abbé Rozier. A large quantity of lees is formed, which subsides when the vinegar becomes clear. This lees is very analogous to the fibrous matter.

Vinegar is purified by distillation. The first portions which pass over are weak; but soon afterwards the acetous acid rises, and is stronger the later it comes over in the distillation. This fluid is called *distilled vinegar*; and is thus cleared of its colouring principle, and the lees, which are always more or less abundant. Vinegar may likewise be concentrated by exposing it to the frost. The superabundant water freezes, and leaves the acid more condensed.

A pound of the coarsest sugar added to a gallon of water, and placed in the sun without being corked, will, in the

course of a few weeks, make very good vinegar. Gooseberries, apples, or other recent fruits, also make very good vinegar.

EELS in VINEGAR. See ANIMALCULE.

VINEYARD, a plantation of vines. The best situation of a vineyard is on the declivity of a hill facing the south.

VIO (Thomas de). See CAJETAN.

VIOL, a musical instrument of the same form with the violin, and, like that, struck with a bow.

VIOLA, in botany: a genus of plants of the class *syngenesia*, order *monogynia*; in the natural system arranged under the 20th order, *Campanulacæ*. The calyx is pentaphyllous; the corolla five petaled, irregular, with a nectarium behind, horn-shaped; the capsule is above the germen, three-valved, monolocular. There are 28 species; six of which are natives of Britain. The most important of these are, 1. The *palustris*, marsh violet. The leaves are smooth, reniform, two or three on each footstalk: flowers pale blue, small, inodorous. An infusion of the flowers is an excellent test of the presence of acids and alkalis. 2. The *odorata*, purple sweet violet, has leaves heart-shaped, notched: flowers deep purple, single; creeping scions. The flowers of this plant taken in the quantity of a dram or two are said to be gently purgative or laxative, and, according to Bergius and some others, they possess an anodyne and pectoral quality. 3. *Tricolor*, pansies, heart-s-ease, or three faces under a hood. The stems are diffuse, procumbent; triangular; the leaves oblong, cut at the edges; stipule dentated: the flowers purple, yellow, and light blue; inodorous. This elegant little plant merits culture in every garden, for the beauty and great variety of its three-coloured flowers; and it will succeed any-where in the open borders, or other compartments, disposed in patches towards the front; either by sowing the seed at once to remain, or by putting in young plants previously raised in a seed-bed: they will begin flowering early in summer, and will continue shooting and flowering in succession till winter; and even during part of that season in mild weather. The common violet is propagated by parting the roots, sometimes by seed.

VIOLATION, the act of violating, that is, forcing a woman, or committing a rape upon her.—This term is also used in a moral sense, for a breach or infringement of a law, ordinance, or the like.

VIOLET, in botany. See VIOLA.

VIOLET-Crab, in zoology. See CANCEL.

VIOLIN, or FIDDLE, a musical instrument mounted with four strings or guts, and struck or played with a bow. The style and sound of the violin is the gayest and most sprightly of all other instruments; and hence it is of all others the fittest for dancing. Yet there are ways of touching it, which render it grave, soft, languishing, and fit for church or chamber music. It generally makes the treble or highest parts in concerts. Its harmony is from fifth to fifth. Its play is composed of bass, counter-tenor, tenor, and treble; to which may be added, a fifth part: each part has four-fifths, which rise to a greater seventeenth.

VIOLONCELLO, of the Italians, is properly our fifth violin; which is a little bass violin half the size of the common bass violin, and the strings bigger and longer in proportion: consequently its sound is an octave lower than our bass violin; which has a noble effect in concert.

VIPER, in zoology. See COLUBER, POISON, and SERPENT; in which last article every thing concerning the poison of the viper, for which we referred from POISON, is already diffused.

VIRAGO, a woman of extraordinary stature and courage; and who, with the female sex, has the mien and air of a man, and performs the actions and exercises of men.

VIRGIL, in Latin PUBLIUS VIRGILIUS MARO, the most excellent of all the ancient Roman poets, was born Oct. 15, U. C. 684, in the consulship of Pompey and Crassus, at a village called Andes, not far from Mantua. His father was undoubtedly of low birth and mean circumstances, but by his industry so much recommended himself to his master, that he gave him his daughter, named Maia, in marriage, as a reward of his fidelity. Our poet, discovering early marks of a very fine genius, was sent at twelve years old to study at Cremona, where he continued till his seventeenth year. He was then removed to Milan, and from thence to Naples, being the residence of several teachers of philosophy and polite learning; and applied himself heartily to the study of the best Greek and Roman writers. But physic and mathematics were his favourite sciences, which he cultivated with much care. He learned the Epicurean philosophy under the celebrated Syro. His acquaintance with Varus, his first patron, commenced by his being fellow-student with him under this philosopher. We have no certain knowledge of the time and occasion of Virgil's going to Rome, how his connections with the wits and men of quality began, nor how he was introduced to the court of Augustus.

In the warmth of early youth, he formed a noble design, of writing an heroic poem "On the Wars of Rome;" but, after some attempts, was discouraged from proceeding, by the roughness and asperity of the old Roman names. He turned himself, therefore, to pastoral; and, being captivated with the beauty and sweetness of Theocritus, was ambitious to introduce this new species of poetry among the Romans. His first performance in this way is supposed to have been written U. C. 709, the year before the death of Julius Cæsar, when the poet was in his 25th year: it is entitled, "Alexis." Possibly "Palæmon" was his second. Mr. Warton places "Silenus" next; which is said to have been publicly recited on the stage by Cytheris, a celebrated comedian. Virgil's fifth eclogue is composed in allusion to the death and deification of Cæsar. The battle of Philippi in 712, having put an end to the Roman liberty, the veteran soldiers began to murmur for their pay; and Augustus, to reward them, distributed among them the lands of Mantua and Cremona. Virgil was involved in this common calamity, and applied to Varus and Pollio, who warmly recommended him to Augustus, and procured for him his patrimony again. Full of gratitude to Augustus, he composed the "Tityrus," in which he introduces two shepherds: one of them, complaining of the distraction of the times, and of the havoc the soldiers made among the Mantuan farmers; the other, rejoicing for the recovery of his estate, and promising to honour the person who restored it to him as a god. But, our poet's joy was not of long continuance; for, we are told, that when he returned to take possession of his farm, he was violently assaulted by the intruder, and would have certainly been killed by him, if he had not escaped by swimming hastily over the Mincio. Upon this unexpected disappointment, melancholy and dejected, he returned to Rome, to renew his petition; and, during his journey, seems to have composed his ninth eclogue. The celebrated eclogue, entitled, "Pollio," was composed in 714, upon the following occasion. The consul Pollio on the part of Anthony, and Mæcenæ on the part of Cæsar, had made up the differences between them; by agreeing, that Octavia, half-sister to Cæsar, should be given in marriage to Antony. This agreement caused an universal joy; and Virgil, in this eclogue, testified his. It is dedicated to Pollio by name, who was at that time consul; and therefore we are sure of the date of this eclogue, as it is known that he enjoyed that high office in 714. In 715, Pollio was sent against the Parthini, a people of Illyricum; and during this

Vol. X.

expedition, Virgil addressed to him a beautiful eclogue, called "Pharmaceutria." His tenth and last eclogue is addressed to Gallus.

Being in his 34th year, he retired to Naples; and laid the plan of his inimitable "Georgics," which he undertook at the entreaties of Mæcenæ, to whom he dedicated them. They are divided into four books; and the subjects of them are particularly specified in the four first lines of the first book. Corn and ploughing are the subject of the first book, vines of the second, cattle of the third, and bees of the fourth.

He is supposed to have been in his 45th year, when he began to write the "Æneid." This poem may very well be considered as a political work. Virgil wrote in defence of the new usurpation of the state; and all that can be offered in his vindication, which however seems enough, is, that the Roman government could no longer be kept from falling into a single hand, and that the usurper he wrote for was as good a one as they could have. But, whatever may be said of his motives for writing it, the poem has in all ages been highly applauded. Augustus was eager to peruse it before it was finished; and entreated him by letters to communicate it. The poet at length complied, and read himself the sixth book to the emperor, when Octavia, who had just lost her son Marcellus, the darling of Rome, and adopted son of Augustus, made one of the audience. Virgil had artfully inserted a beautiful lamentation for the death of young Marcellus; upon hearing which, Octavia could bear no more, but fainted away, overcome with surprise and sorrow. When she recovered, she made the poet a present of ten sesterces for every line, which amounted in the whole to above 2000l.

The "Æneid" being brought to a conclusion, but not to the perfection our author intended to give it, he resolved to travel into Greece, to correct and polish it at leisure. Augustus, returning victorious from the East, met with Virgil at Athens, who thought himself obliged to attend the emperor to Italy, but the poet was suddenly seized with a fatal distemper, which, being increased by the agitation of the vessel, put an end to his life as soon as he landed at Brundisium. He died September 22d, in his 52d year. He had ordered in his will, that the "Æneid" should be burnt as an unfinished poem; but Augustus forbade it, and had it delivered to Varius and Tucca, with the strictest charge to make no additions, but only to publish it correctly. He died with such steadiness and tranquillity, as to be able to dictate his own epitaph. His bones were carried to Naples, according to his earnest request; and a monument was erected at a small distance from the city.

The genuine and undisputed works of this poet are ten "Eclogues, or Bucolics," four books of "Georgics," and the "Æneid" in twelve books. The "Culex," the "Ceiris," and some smaller pieces, called "Catalecta," are subjoined to some editions of his works.

VIRGIL (Polydore), an English historian, born at Urbino in Italy, was sent in the beginning of the 16th century, by pope Alexander VI. as sub-collector of the Papal tax, called *Petence*, in this kingdom. He had not been long in England before he obtained preferment in the church; for in 1503 he was promoted to the rectory of Church-Langton in the archdeaconry of Leicester. In 1507 he was collated to the prebend of Scamley in the church of Lincoln; and in the same year was made archdeacon of Wells, and prebendary of Hereford. In 1513 he resigned his prebend of Lincoln, and was collated to that of Oxgate in St. Paul's, London. We are told, that on his preferment to the archdeaconry of Wells, he resigned the office of sub-collector to the pope, and determined to spend the remainder of his life in England, the History of which kingdom he began in the year 1505, at the command of Henry VII. That work cost him 12 years'

U

labour. In 1528 he finished his treatise on Prodigies. Polydore continued in England during the whole reign of Henry VIII. and part of that of Edward VI. whence it is concluded that he was a moderate Papist. In 1550, being now an old man, he requested leave to revisit his native country. He was accordingly dismissed with a present of 300 crowns, together with the privilege of holding his preferments to the end of his life. He died at Urbino in the year 1555. As an historian, he is accused by some as a malignant slanderer of the English nation; yet Jovius remarks, that the French and Scotch accuse him of having flattered that nation too much: (See his *Elog.* cap. 137. p. 179). Besides the above, he wrote, 1. *De rerum inventioribus*; of which an English translation was published by Tangle in 1663. It was also translated into French and Spanish. 2. *De prodigiis et fortibus*. 3. *Episcoporum Angliæ catalogus*. Manuscript. 4. *De vita perfecta*, Basil, 1546, 1553, 8vo. 5. *Epistole eruditæ*; and some other works.

VIRGINIA, one of the United States of America, bounded on the north by Pennsylvania and Maryland, on the east by Maryland, the Chesapeake, and the Atlantic Ocean, on the south by North Carolina, on the west by Kentucky, and on the north-west by the river Ohio, which separates it from the Indians; about 300 miles from east to west, and 180 from north to south; several ridges of mountains cross this country from north to south, a little inclining westerly as they advance towards the south; they extend from the state of New York as far as Georgia, under different names: in Virginia, they are called the Blue Mountains, North Mountains, Warmspring or Jackson's Mountains, Allegany Mountains, and Laurel Mountains; the most easterly at least one hundred miles from the Atlantic; the soil of the land, free from the mountains, is in general tolerably good, and capable of bearing the different kinds of corn and pulse, cotton, flax, and hemp; and in the marshy land rice has been lately cultivated. Before the revolution, the chief object was tobacco, but since that time corn has more engaged the attention of the Virginia farmers. In the south-west parts of the state, near the Kanaway rivers, are mines of lead: mines of copper also have been found, and mines of iron; and in several places, coals. Marble is found in considerable quantities, and limestone; and many medicinal springs have been discovered in different parts. The principal rivers are James river, York, Potomack, Roanoke, and Kanaway Great and Little. Virginia is divided into eighty-two counties. There are but few towns of consequence in the state, the principal are Williamburgh, Norfolk, Alexandria, and Richmond. The number of inhabitants, in the year 1790, amounted to 747,610. By the declaration of rights, in May 1776, a free toleration of religious worship is allowed to all: the principal denominations of Christians are episcopalians who are the most ancient settlers, presbyterians, methodists, and baptists. Before the war with England, the Virginians imported almost the whole of their clothing, of which they now manufacture three-fourths; the manufacture of iron and lead are both very considerable, but agriculture seems to be the principal employment. In the year 1586, Sir Walter Raleigh procured several merchants and gentlemen to advance large sums of money towards carrying on the design he had formed, of making farther discoveries in the West Indies: and, in the year following, he obtained letters patent from the queen, to possess, plant, and enjoy for himself and such persons as he should nominate, themselves, and their successors, all such lands, territories, &c. as they should discover not in the possession of any Christian nation. In April following, the merchants and gentlemen, by Sir Walter's directions, fitted out two small vessels, under the command of Captain Philip Amidas, and Captain Arthur Barlow, two of Sir Walter's servants, who knowing no better course, sailed away

to the Canaries; from thence to the Caribbee Islands, and crossing the Gulf of Mexico made the coast of Florida. They were so ignorant of navigation, that, by the computation of able seamen, they went above a thousand leagues out of their way. Their voyage, however, was prosperous and they anchored in an inlet by the Roanoke. They landed upon certain islands on the coast, between Cape Fear and the Bay of Chesapeake. They saw none of the natives till the third day after their landing, when they espied three in a canoe. One of them went ashore, and waited without any sign of fear till the English rowed to him. He spoke much to them in his own language, and then went boldly aboard their vessels. They gave him a shirt, a hat, wine and meat, with which he was much pleased. Having attentively viewed every thing, he went away; and within half an hour, he had loaded his canoe with fish, which he brought and divided between the ship and the bark. The next day several canoes came, and in one of them the king's brother. His name was Granganameo; the king was called Wingina, and the country Wingandacoo. The king himself, at that time, lay at his chief town ill of the wounds which he had lately received in a battle. Granganameo, leaving his canoes at some distance, went to the point of land where the English had gone to the Indian the day before. Having spread a mat, he sat down upon it; and when the English came to him well armed, he showed no fear, but made signs to them to sit down, stroking his own head and breast, and then theirs, to express his love. The natives were a proper well-proportioned people, very civil in their behaviour, and highly respectful to Granganameo; for none of them sat down, or spoke a word in his presence, except four; on whom the English also bestowed presents. But Granganameo took them all from them, and made signs that every thing belonged to him. After some small traffic, he went away, but returning in two days, he ate and drank very merrily with them. Not long after, he brought his wife and children on board. After this there came down from all parts great numbers of people, with leather, coral, and divers kind of dyes. But when Granganameo was present, none durst trade but himself, and those who wore red copper on their heads as he did. He would have given a bag of pearls for a suit of armour; but the English refused, as not regarding them, that they might thereby the better learn where they grew. He was very just to his promise, for they often trusted him, and he never failed to come within his day to the place which he promised. He commonly sent the English every day a brace of bucks, rabbits, hares, and fish; and sometimes melons, walnuts, cucumbers, peas, and divers kinds of roots. And the English, to try the strength and goodness of the soil, put some of their peas into the ground, which grew wonderfully, and were found, in ten days' time, fourteen inches high. They returned to England about the middle of September, carrying with them two of the natives, Manteo and Wanchefe; and their discovery was so welcome there, that the queen herself named the country *Virginia*. The advantageous accounts which these first adventurers gave of the fertility, pleasantness, and wholesomeness of the country, induced Sir Richard Grenvil himself to make a voyage thither the next year: and he accordingly set out from Plymouth, the 9th of April, with seven ships. Having made the usual circuit of the Canaries and West Indies, where they took two rich Spanish prizes, and forced a profitable trade, they fell in with the continent of America, near Cape Fear, and were in great danger of being lost upon it. But having happily escaped, they came to an anchor off the island of Wocoon, the 26th of May. They immediately sent to the isle of Roanoke to Wingina the king: and Mr. Arundel went to the main, with Manteo, who proved, throughout their whole stay, very faithful and useful to them. Soon after, the

general, Sir Richard Grenvil, went himself to the main, with a select body of men, and ranging about, discovered several Indian towns. At one of them the Indians stole a silver cup, for which they burnt their town, and destroyed their corn, and so returned to their ships at Wococon. At Hatteras, whither they went soon after, Granganameo, the king's brother, came aboard the admiral, with Manteo. This is the last visit he made to the English, for some time this year he died, and in him they lost a sincere and hearty friend. Sir Richard Grenvil having only made that small excursion on the continent, returned to England: but he left behind him 108 persons, as a colony, to keep possession of, and inhabit the country. Of these he constituted Mr. Ralph Lane governor, a military man of note, who was afterwards knighted, and applying himself to the sea-service was of eminent command in the English navy. With them remained Captain Philip Amidas as admiral, one of the commanders-in-chief in the first adventure, Mr. Thomas Harriot, Captain Stafford, Mr. Kendal, with several others of name in the expedition. This colony chose Roanoke, an island at the mouth of Albemarle Sound, for the place of their habitation, and their chief employment was to reconnoitre and view the country. Their farthest discovery to the southward, was Secotan, an Indian town, by their reckoning, eighty leagues from Roanoke, lying up between the rivers Pampticoe and Neus, in North Carolina. Disputes with the Indians and other circumstances induced Mr. Lane and the rest to return to England, in the year 1586. Sir Walter Raleigh was not idle at home: he provided a ship of 100 tons, and loaded her with plenty of all things necessary for the settlement: but it being Easter before she departed, Mr. Lane and his company had shipped themselves for England in Sir Francis Drake's fleet, a few days before her arrival. Having, therefore, spent some time in seeking them up the country without effect, they returned that summer to England, with all their provision. About a fortnight after the departure of this ship, Sir Richard Grenvil arrived with three ships more, well provided; but he neither found that ship according to his expectation nor could hear any news of the colony which he, himself, had left there the year before. Therefore, after travelling in vain up and down to seek them, finding their habitation abandoned, and being unwilling to lose the possession of the country, he landed fifty men on the island of Roanoke, plentifully furnished with all provisions for two years, and so returned to England. The next year three ships were sent, under the command of Mr. John White, who was appointed governor of the colony, with twelve assistants, as a council. To these Sir Walter Raleigh gave a charter, and incorporated them by the name of the governor and assistants of the city of Raleigh, in Virginia, with express directions to settle at Chesapeake; which, however useful and important, they, nevertheless, disobeyed and neglected. Having taken the old route by the West Indies, they had like to have been cast away upon Cape Fear, through the error or design of Simon Ferdinando. He had been with the Captain Amidas in the first expedition; and being made pilot in this, was suspected of a design to ruin the whole voyage; but being prevented by the vigilance of Captain Stafford, they arrived all safe at Hatteras the 22d of July. Soon after, there arose a dispute between the governor and his assistants or council, concerning a person to be sent to England to solicit supplies; all refused, except one, who was thought very unequal to the business; at last they unanimously pitched upon the governor, as the fittest person; and having signed a paper, testifying his unwillingness to leave the colony, they at length prevailed upon him, with much importunity, to undertake it. Leaving, therefore, above a hundred persons on one of the islands of Hatteras, to form a plantation, he departed, and after many

crosses and difficulties, got first to Ireland, and from thence went to England. At this time the nation was in great commotion, and apprehension of the Spanish invasion; however, having laid a plan of operations, and made proper dispositions for the defence of the nation, Sir Walter found leisure to fit out a small fleet for the relief of the colony, at Bideford, early the next year, which was put under the command of Sir Richard Grenvil, and only waited for a fair wind; but the alarm of the vast and formidable armament, made by the king of Spain, entreating all ships of force, then in any readiness, received orders from the state, to stay in their harbours, for the defence of their own country; and Sir Richard Grenvil was personally commanded not to depart out of Cornwall; however Governor White laboured so strenuously with them, that he obtained two small barks, and put to sea from Bideford, the 22d of April, 1588; but these vessels, though of little force, being more intent on a gainful voyage, than the relief of the colony, ran in chase of prizes; till at last, one of them meeting with two ships of war, was, after a bloody fight, overcome, boarded, and riddled; in this maimed, ransacked, and ragged condition, he returned to England in a month's time; and in about three weeks after, the other also returned, without performing her intended voyage, to the distress, and, as it proved, the utter destruction of the colony in Virginia, and to the great displeasure of their patron at home: these disappointments gave much vexation to Sir Walter Raleigh, who had, by this time, expended, as we are authentically assured, no less than forty thousand pounds upon the enterprise, for which, and other reasons, Sir Walter Raleigh made an assignment to Thomas Smith, with other merchants and adventurers of London, and to Governor White, and other gentlemen, for continuing the plantation of Virginia; but the new assignees were not so diligent and careful of the business, as they ought to have been; for it was a year after before any thing was undertaken by them for the relief of the colony: then Mr. White, with three ships, set sail from Plymouth; and passing by the West Indies, they staid some time there, to perform some exploits, as they called them, which was to attack and plunder the Spaniards, among whom they got a considerable booty. Neither did the colony at all advance before the arrival of Lord Delaware, in the year 1610, from which time it gradually began to flourish.

VIRGO, in astronomy, one of the signs or constellations of the zodiac. See ASTRONOMY.

VIRGULA DIVINITORIA, divining rod. See MINE.

VIRTUE, a term used in various significations. In the general it denotes power, or the perfection of any thing, whether natural or supernatural, animate or inanimate, essential or accidental. But, in its more proper or restrained sense, virtue signifies a habit, which improves and perfects the possessor and his actions. See MORAL PHILOSOPHY.

VIRTUOSO, an Italian term lately introduced into the English, signifying a man of curiosity and learning, or one who loves and promotes the arts and sciences. But among us the term seems to be appropriated to those who apply themselves to some curious and quaint rather than immediately useful art or study; as antiquaries, collectors of rarities of any kind, microscopical observers, &c.

VISCERA, in anatomy, a term signifying the same with entrails; including the heart, liver, lungs, spleen, intestines, and other inward parts of the body.

VISCOUNT (*Vice Comes*), was anciently an officer under an earl, to whom, during his attendance at court, he acted as deputy to look after the affairs of the country. But the name was afterwards made use of as an arbitrary title of honour, without any shadow of office pertaining to it, by Henry VI.; when, in the 18th year of his reign, he created John Beauchamp

mont a peer by the name of *Vifcount Beaumont*; which was the first instance of the kind. A viscount is created by patent as an earl is; his title is *Right Honourable*; his mantle is two doublings and a half of plain fur; and his coronet has only a row of pearls close to the circle.

VISCUM, in botany : a genus of plants of the class *diccia*, order *tetrandria*, and in the natural system arranged under the 48th order, *Aggregate*. The male calyx is quadripartite; the anthers adhere to the calyx : the female calyx consists of four leaves; there is no style: the stigma is obtuse. There is no corolla; the fruit is a berry with one seed. There are nine species; only one of which is a native of Britain, viz. the *album*, or common mistletoe. It is a shrub growing on the bark of several trees: the leaves are conjugate and elliptical, the stem forked; the flowers whitish in the axils of the leaves. This plant was reckoned sacred among the druids.

VISHNOU, that person in the triad of the Bramins who is considered as the *preserver* of the universe. *Brahma* is the creator, and *Siva* the destroyer: and these two, with Vishnou, united in some inexplicable manner, constitute *Brahme*, or the supreme numen of the Hindoos. See **POLYTHEISM**.

VISIER, an officer or dignitary in the Ottoman empire, whereof there are two kinds; one called by the Turks *Vizier-azem*, that is, "grand visier," is the prime minister of state in the whole empire. He commands the army in chief, and presides in the divan or great council. Next to him are six other subordinate visiers, called *visiers of the bench*; who officiate as his counsellors or assessors in the divan.

VISION, in optics, the act of seeing or perceiving external objects by means of the organ of sight, the eye. See **ANATOMY** and **OPTICS**.

VISTULA, or **WEISEL**, a large river of Poland, which taking its rise in the mountains south of Silesia, visits Cracow, Warsaw, &c. and continuing its course northward, falls into the Baltic sea below Dantzic.

VITAL, in physiology, an appellation given to whatever ministers principally to the constituting or maintaining life in the bodies of animals: thus the heart, lungs, and brain, are called *vital parts*; and the operations of these parts by which the life of animals is maintained are called *vital functions*.

VITALIANO (Donati), an eminent naturalist, was born in Padua the 8th of September, 1717. He showed from his childhood the greatest inclination for botany and natural history; and, at the age of twelve years, knew all the medicinal plants, and had made a collection of natural productions. When some years older, he profited by the friendship of the celebrated Ponteder, and was generously furnished with books and informations by the living professor Vallisneri, junior. His best masters were, however, his own mountain and maritime peregrinations; which he began in Dalmatia in 1743, and continued for five years. He was chosen for adjutant to the marquis Poleni, public professor of experimental physics, and cultivated under so great a master all the parts of physico-mathematics. With him he made a journey to Rome, and there became an intimate friend of Leprotti the papal physician, to whom he afterwards dedicated his *Saggio della flora naturale dell' Adriatico*; a work of great merit, which count Ginanni of Ravenna endeavoured to depreciate, though with little success. The essay of Donati was published in 1750, and was afterwards translated into French. The fame which our author acquired induced his Sardinian majesty to appoint him professor of botany and natural history at Turin. He went there very willingly; made many excursions among the mountains of Savoy and Genoa, and would have been happy could he always have conversed with the mountaineers, who generally are harmless people. The king his master sent him out of the way of his

enemies, whose envy and hatred his merit alone had raised; he commanded him to set out on a voyage to Egypt, and from thence to visit Syria, Palestine, Arabia, and the East Indies, to make observations and to collect the rarest productions of nature. In 1759 he was in Alexandria, saw Egypt as far as the great cataract of the Nile, and a great part of Palestine, Arabia, and Chaldea; and in all those travels was exposed to suffer the cruel consequences of a bad choice which he had made of his companions. While he laid at Balfora, waiting for orders from court, he fell ill of a putrid fever, and died in a few days. The news of his death came to Turin about the end of October 1763. He left in manuscript two volumes in folio.

VITELLUS, the yolk of an egg. See **EGG**.

VITIS, in botany : a genus of the class *pentandria*, order *monogymia*; and in the natural system arranged under the 46th order, *Pectoracea*. The petals cohere at the top, and are withered; the fruit is a berry with five seeds. There are 11 species; the most important of which is the *vinifera* or common vine, which has naked, lobed, sinuated leaves. There are a great many varieties; but a recital of their names would be tiresome without being useful. All the sorts are propagated either from layers or cuttings, the former of which is greatly practised in England, but the latter is much preferable.

In choosing the cuttings, you should always take such shoots of the last year's growth as are strong and well ripened; these should be cut from the old vine, just below the place where they were produced, taking a knot, or piece of the two years' wood to each, which should be pruned smooth; then you should cut off the upper part of the shoots, so as to leave the cutting about sixteen inches long. When the piece or knot of old wood is cut at both ends, near the young shoot, the cutting will resemble a little mallet; from whence Columella gives the title of *malleolus* to the vine cuttings. In making the cuttings after this manner, there can be but one taken from each shoot; whereas most persons cut them into lengths of about a foot, and plant them all: which is very wrong, for various reasons too tedious to mention.

When the cuttings are thus prepared, if they are not then planted, they should be placed with their lower part in the ground in a dry soil, laying some litter upon their upper parts to prevent them from drying: in this situation they may remain till the beginning of April (which is the best time for planting them); when you should take them out, and wash them from the filth they have contracted; and if you find them very dry, you should let them stand with their lower parts in the water six or eight hours, which will defend their vessels, and dispose them for taking root. If the ground be strong and inclined to wet, you should open a trench where the cuttings are to be planted, which should be filled with lime rubbish, the better to drain off the moisture: then raise the borders with fresh light earth about two feet thick, so that it may be at least a foot above the level of the ground: then you should open the holes at about six feet distance from each other, putting one good strong cutting into each hole, which should be laid a little sloping, that their tops may incline to the wall; but it must be put in so deep, as that the uppermost eye may be level with the surface of the ground; for when any part of the cutting is left above ground, most of the buds attempt to shoot, so that the strength of the cuttings is divided to nourish so many shoots, which must consequently be weaker than if only one of them grew; whereas, by burying the whole cutting in the ground, the sap is all employed on one single shoot, which consequently will be much stronger; besides, the sun and air are apt to dry that part of the cutting which remains above ground, and so often prevents their buds from shooting.

Having placed the cutting into the ground, fill up the hole gently, pressing down the earth with your foot close about it, and raise a little hill just upon the top of the cutting, to cover the upper eye quite over, which will prevent it from drying. Nothing more is necessary but to keep the ground clear from weeds, until the cuttings begin to shoot: at which time you should look over them carefully, to rub off any small shoots, if such are produced, fastening the first main shoot to the wall, which should be constantly trained up, as it is extended in length, to prevent its breaking or hanging down. You must continue to look over these once in about three weeks during the summer season, constantly rubbing off all lateral shoots which are produced; and be sure to keep the ground clear from weeds, which, if suffered to grow, will exhaust the goodness of the soil and starve the cuttings. The Michaelmas following, if your cuttings have produced strong shoots, you should prune them down to two eyes. In the spring, after the cold weather is past, you must gently dig up the borders to loosen the earth; but you must be very careful, in doing this, not to injure the roots of your vines: you should also raise the earth up to the stems of the plants, so as to cover the old wood, but not so deep as to cover either of the eyes of the last year's wood. After this they will require no farther care until they begin to shoot; when you should rub off all weak dangling shoots, leaving no more than the two produced from the two eyes of the last year's wood, which should be fastened to the wall. From this time till the vines have done shooting, you should look them over once in three weeks or a month, to rub off all lateral shoots as they are produced, and to fasten the main shoots to the wall as they are extended in length; about the middle or latter end of July, it will be proper to nip off the tops of these two shoots which will strengthen the lower eyes. During the summer season you must constantly keep the ground clear from weeds: nor should you permit any sort of plants to grow near the vines, which would not only rob them of nourishment, but shade the lower parts of the shoots, and thereby prevent their ripening; which will not only cause their wood to be spongy and luxuriant, but render it less fruitful.

As soon as the leaves begin to drop in autumn, you should prune these young vines again, leaving three buds to each of the shoots, provided they are strong: otherwise it is better to shorten them down to two eyes if they are good; for it is a very wrong practice to leave much wood upon young vines, or to leave their shoots too long, which greatly weakens the roots: then you should fasten them to the wall, spreading them out horizontal each way, that there may be room to train the new shoots the following summer, and in the spring the borders must be dugged as before.

The uses of the fruit of the vine for making wine, &c. are well known. The vine was introduced by the Romans into Britain, and appears formerly to have been very common. From the name of vineyard yet adhering to the ruinous sites of our castles and monasteries, there seem to have been few in the country but what had a vineyard belonging to them. The county of Gloucester is particularly commended by Malmsbury in the twelfth century, as excelling all the rest of the kingdom in the number and goodness of its vineyards. In the earlier periods of our history, the title of Ely was expressly denominated the *Isle of Vines* by the Normans. Vineyards are frequently noticed in the descriptive accounts of doomsday; and those of England are even mentioned by Bede as early as the commencement of the eighth century.

Doomsday exhibits to us a particular proof that wine was made in England during the period preceding the conquest. And after the conquest the bishop of Ely appears to have

received at least three or four tuns of wine annually, as tythes, from the produce of the vineyards in his diocese; and to have made frequent reservations in his leases of a certain quantity of wine for rent. A plot of land in London, which now forms East-Smithfield and some adjoining streets, was withheld from the religious house within Aldgate by four successive constables of the Tower, in the reigns of Rufus, Henry, and Stephen, and made by them into a vineyard to their great emolument and profit. In the old accounts of rectorial and vicarial revenues, and in the old registers of ecclesiastical suits concerning them, the title of wine is an article that frequently occurs in Kent, Surry, and other counties. And the wines of Gloucestershire, within a century after the conquest, were little inferior to the French in sweetness. The beautiful region of Gaul, which had not a single vine in the days of Cæsar, had numbers so early as the time of Strabo. The fourth of it was particularly stocked with them; and they had even extended themselves into the interior parts of the country: but the grapes of the latter did not ripen kindly. France was famous for its vineyards in the reign of Vespasian, and even exported its wines into Italy. The whole province of Narbonne was then covered with vines; and the wine-merchants of the country were remarkable for all the knavish dexterity of our modern brewers, tinging it with smoke, colouring it (as was suspected) with herbs and noxious dyes, and even adulterating the taste and appearance with aloe. And, as our first vines would be transplanted from Gaul, so were in all probability those of the Allobroges in Franche Compté. These were peculiarly fitted for cold countries. They ripened even in the frosts of the advancing winter. And they were of the same colour, and seem to have been of the same species, as the black Mulcades of the present day, which have lately been tried in the island, and found to be fittest for the climate. These were pretty certainly brought into Britain a little after vines had been carried over all the kingdoms of Gaul, and about the middle of the third century; when the numerous plantations had gradually spread over the face of the latter, and must naturally have continued their progress into the former.

The Romans, even nearly to the days of Lucullus, were very seldom able to regale themselves with wine. Very little was then raised in the camps of Italy. And the foreign wines were so dear, that they were rarely produced at an entertainment; and when they were, each guest was indulged only with a single draught. But in the seventh century of Rome, as their conquests augmented the degree of their wealth, and enlarged the sphere of their luxury, wines became the object of particular attention. Many vaults were constructed, and good stocks of liquor deposited in them. And thus naturally gave encouragement to the wines of the country. The Palernian rose immediately into great repute; and a variety of others, that of Florence among the rest, succeeded it about the close of the century. And the more westerly parts of the European continent were at once subjected to the arms, and enriched with the vines, of Italy.

But the scarcity of the native, and dearth of the foreign wines in that country, several ages before the conquest of Lancashire, had called out the spirit of invention, and occasioned the making of fictitious wines. These were still continued by the Romans, and naturally taught to the Britons. And they were made of almost all the products of the orchard and garden, the pear, the apple, mulberry, service, and rose. Two of them, therefore, were those agreeable liquors which we still denominate *cyder* and *perry*. The latter would be called *pyrum* by the Romans, and is therefore called *perry* or *pear-water* by us. And the former assumed among the

Romans the appellation of *ficera*, which was colloquially pronounced by them *fidera*, as the same pronunciation of it among the present Italians shows; and retains therefore the denomination of *cyder* among ourselves.

VITREOUS HUMOUR OF THE EYE. See ANATOMY.

VITRIFICATION, in chemistry, the conversion of a body into glass by means of fire. See GLASS.

VITRIOL, a compound salt, formed by the union of iron, copper, or zinc, with the sulphuric acid. It is of three colours, white, blue, and green, according to the metal.

VITRIOLATED, among chemists, something impregnated, or supposed to be so, with vitriol or its acid.

VITRIOLIC ACID. See SULPHURIC ACID and CHEMISTRY.

VITRUVIUS POLLIO (Marcus), a very celebrated Roman architect, was, according to the common opinion, born at Verona, and lived in the reign of Augustus, to whom he dedicated his excellent treatise on architecture, divided into ten books. William Philander's edition of this celebrated work is esteemed. Claudius Perrault has given an excellent translation of it in French, with learned notes. There are also several English translations of Vitruvius.

VITUS'S DANCE (St.). See MEDICINE.

VIVERRA, THE WEASEL: a genus of quadrupeds belonging to the order of feræ. They have six fore-teeth, the intermediate ones being shorter, and more than three grinders, and the claws are exerted. There are twenty-seven species, the principal of which are,

1. The *ichneumon*, with the tail tapering to a point, and the toes distinct from each other; inhabits Egypt, Barbary, India, and its islands. It is there a most useful animal, being an inveterate enemy to the serpents and other noxious reptiles which infest the torrid zone; it attacks without dread that most fatal of serpents the *Naja*, or *Cobra de Capello*; and should it receive a wound in the combat, instantly retires, and is said to obtain an antidote from a certain herb (according to Sparmann the *ophiorhiza*); after which it returns to the attack, and seldom fails of victory: it is a great destroyer of the eggs of crocodiles, which it digs out of the sand; and even kills multitudes of the young of those terrible reptiles: it was not therefore without reason that the ancient Egyptians ranked the *ichneumon* among their deities. This animal is at present domesticated and kept in houses in India and in Egypt, for it is more useful than a cat in destroying rats and mice; and grows very tame. It is very active; springs with great agility on its prey; will glide along the ground like a serpent, and seem as if without feet. It fits up like a squirrel, and eats with its fore-feet, catching any thing that is flung to it. It is a great enemy to poultry, and will draw itself dead till they come within reach: loves fish; drains its prey, after sucking the blood, to its hole. Its excrements are very fetid; when it sleeps, it brings its head and tail under its belly, appearing like a round ball, with two legs sticking out. Rumphius observes how skillfully it seizes the serpents by the throat, so as to avoid receiving any injury; and Lucan beautifully describes the same address of this animal in conquering the Egyptian asp.

2. The *ulpescula*, or sliding weasel, has a short slender nose; short ears and legs; black body, full of hair; the tail long, of a black and white colour; length from nose to tail about eighteen inches. It inhabits Mexico, and perhaps other parts of America. This and some other species are remarkable for the pestiferous, suffocating, and most fetid vapour they emit from behind, when attacked, pursued, or frightened: it is their only means of defence. Some turn their tail to their enemy, and keep them at a distance by a frequent crepus; and others ejaculate their urine, tainted

with the horrid effluvia, to the distance of eighteen feet. The pursuers are stopped with the terrible stench. Should any of this liquor fall into the eyes, it almost occasions blindness: if on the clothes, the smell will remain for several days, in spite of all washing; they must even be buried in fresh foil, in order to be sweetened. Dogs that are not true bred, run back as soon as they perceive the smell: those that have been used to it, will kill the animal; but are often obliged to relieve themselves by thrusting their noses into the ground. There is no bearing the company of a dog that has killed one for several days. Professor Kalm was one night in great danger of being suffocated by one that was pursued into a house where he slept; and it affected the cattle so, that they belched through pain. Another, which was killed by a maid-servant in a cellar, so affected her with its stench, that the lay ill for several days; all the provisions that were in the place were so tainted, that the owner was obliged to throw them away. Notwithstanding this, the flesh is reckoned good meat, and not unlike that of a pig; but it must be skinned as soon as killed, and the bladder taken carefully out. It breeds in hollow trees, or holes under ground, or in clefts of rocks; climbs trees with great agility; kills poultry; eats eggs, and destroys young birds.

3. The *zibetha*, or civet-cat, has short rounded ears; the back and sides cinerous, tinged with yellow, marked with large dusky spots disposed in rows; the hair coarse; that on the top of the body longest, standing up like a mane; the tail sometimes wholly black; sometimes spotted near the base; length, from nose to tail, about two feet three inches; the tail fourteen inches: the body pretty thick. It inhabits India, the Philippine Isles, Guinea, Ethiopia, and Madagascar. The famous drug musk, or civet, which is produced from an aperture between the privities and the anus, in both sexes, is secreted from certain glands. The persons who keep them procure the musk by scraping the inside of this bag twice a-week with an iron spatula, and get about a dram each time: but it is seldom sold pure, being generally mixed with suet or oil, to make it more weighty. The males yield the most, especially when they are previously irritated. They are fed, when young, with pap made of millet, with a little flesh or fish; when old, with raw flesh. In a wild state, they prey on fowl. These animals seem not to be known to the ancients: it is probable the drug was brought without their knowing its origin; for it is certain the fine gentlemen in Rome used perfumes.

VIVES, in farrery. See FARRIERY.

VIVIPAROUS, in natural history, an epithet applied to such animals as bring forth their young alive and perfect; in contradistinction to those that lay eggs, which are called *oviparous* animals.

UKRAINE, a large country of Europe, lying on the borders of Turkey in Europe, Poland, Russia, and Little Tartary. Its name properly signifies a *frontier*. By a treaty between Russia and Poland in 1693, the latter remained in possession of all that part of the Ukraine lying on the west side of the river Dnieper, which is but indifferently cultivated; while the country on the east side, inhabited by the Cossaks, is in much better condition. The Russian part is comprised in the government of Kiof; and the empress of Russia having obtained the Polish palatinate of Kiof, by the treaty of partition in 1793, the whole of the Ukraine, on both sides of the Dnieper, belongs now to that ambitious and formidable power. The principal town is Kiof.

ULCER, in surgery. See SURGERY.

ULCER, in farrery. See FARRIERY.

ULEX, in botany: a genus of plants of the class of *diadelphia*, and order of *decandria*; and in the natural system

arranged under the 32d order, *Papilionaceæ*. The calyx consists of two leaves quinquefoliate: pod almost covered by the calyx. There are two species; one of which, the *Europæus*, the furze, gorse, or whin, is a native of Britain; it is too well known to need description. Its uses, however, are many; as a fuel where wood and coals are scarce; and as hedge-wood upon light barren land: its use as horie provender too seems to be fully proved, though not yet established. See FENCE.

ULIATEA, one of the Society Islands, in the South Pacific Ocean. On the east and west coasts of this island, are some good harbours. The land is hilly, broken, and irregular, except on the sea coast; yet the hills are green and pleasant, and in many parts abound with wood: the productions and manners of the inhabitants are similar to those of Otaheite. The fourth extremity of the island lies in Long. 181. 20. W. Greenwich. Lat. 16. 55. S.

ULIGINOUS, in agriculture, an appellation given to a moist, moorish, and fenny soil.

ULLAGE, in gauging, is so much of a cask or other vessel as it wants of being full.

ULM, a free and imperial city of Germany, in the circle of Swabia, seated on the river Iller. It is a pretty large place, defended by fortifications; and the inhabitants are Protestants. Here the archives of the circle are deposited, and it carries on a very great trade. The elector of Bavaria became master of it, in 1702, by a stratagem; but, in 1704, the French being vanquished at the battle of Hochstet, the Bavarians surrendered it by capitulation. The Roman-catholics have but two churches, all the rest belonging to the Protestants. E. Long 10. 12. N. Lat. 48. 25.

ULMUS, in botany: a genus of plants belonging to the class of *pentandria*, and order of *dignia*; and in the natural system arranged under the 53d order, *Scabridæ*. The calyx is quinquefid; there is no corolla. The fruit is a dry, compressed, membranaceous berry. There are three species, one of which is a native of Britain. The *campestris*, common elm. The leaves are rough, oval, pointed, doubly serrated, unequal at the base. Bark of the trunk cracked and wrinkled. Fruit membranous. The *montana*, or wych elm, is generally reckoned a variety of this species. All the sorts of elm may be either propagated by layers or suckers taken from the roots of the old trees, the latter of which is generally practised by the nursery-gardeners: but as these are often cut up with indifferent roots, they often miscarry; and render the success doubtful; whereas those which are propagated by layers are in no hazard, and always make better roots, and come on faster than the other, and do not send out suckers from their roots in such plenty, for which reason this method should be more universally practised. The elm delights in a stiff strong soil. It is observable, however, that here it grows comparatively slow. In light land, especially if it be rich, its growth is very rapid; but its wood is light, porous, and of little value, compared with that which grows upon strong land; which is of a closer stronger texture, and, at the heart, will have the colour, and almost the heaviness and the hardness, of iron: on such soils the elm becomes profitable, and is one of the trees which ought in preference to all others to engage the planter's attention.

ULSTER, a province of Ireland, containing the northern counties of Donegal, Londonderry, Antrim, Tyrone, Fermanagh, Monaghan, Armagh, Down, and Cavan.

ULTERIOR, in geography, is applied to some part of a country or province, which, with regard to the rest of that country, is situated on the farther side of the river, mountain, or other boundary, which separates the two countries.

ULTRAMARINE, a beautiful blue colour used by the painters, prepared from the lapis lazuli by calcination.

ULTRAMONTANE, something beyond the mountains. The term is principally applied in relation to France and Italy, which are separated by the Alps.

ULVA, in botany: a genus of plants of the class of *cryptogamia*, and order of *Algae*. The fructification is inclosed in a diaphanous membrane. There are seventeen species; twelve of which are British plants. They are all sessile, and without roots, and grow in ditches and on stones along the sea-coast. None of them are applied to any particular use different from the rest of the algae, except perhaps the *umbilicatis*, which in England is pickled with salt and preserved in jars, and afterwards stewed and eaten with oil and lemon-juice. This species, called in English the *navel laver*, is flat, orbicular, sessile, and coreaceous.

ULUG BEIG, a Persian prince and learned astronomer, was defended from the famous Tamerlane, and reigned at Samarcand about forty years; after which he was murdered by his own son in 1449. His catalogue of the fixed stars, rectified for the year 1434, was published at Oxford by Mr. Hyde, in 1665, with learned notes. Mr. Hudson printed in the English Geography Ulug Beig's Tables of the Longitude and Latitude of Places; and Mr. Greaves published, in Latin, his Astronomical Epochas, at London, in 1650.

ULYSSES, king of Ithaca, the son of Laertes, and father of Telemachus, and one of those heroes who contributed most to the taking of Troy. After the destruction of that city, he wandered for ten years; and at last returned to Ithaca, where, with the assistance of Telemachus, he killed Antinous and other princes who intended to marry his wife Penelope and seize his dominions. He at length resigned the government of his kingdom to his son Telemachus; and was killed by Telegonus, his son by Circe, who did not know him. This hero is the subject of the *Odyssey*.

UMBELLA, an UMBEL, in botany: a species of receptacle; or rather a mode of flowering, in which a number of slender footstalks proceed from the same centre, and rise to an equal height, so as to form an even and generally round surface at top. See BOTANY.

UMBELLATE, the name of a class in Ray's and Tournefort's methods, consisting of plants whose flowers grow in umbels, with five petals that are often unequal, and two naked seeds that are joined at top and separated below. The same plants constitute the 45th order of Linnæus's Fragments of a Natural Method. See BOTANY.

UMBELLIFEROUS PLANTS, are such as have their tops branched and spread out like an umbrella.

UMBER, or UMBRE, in natural history, a fossil brown or blackish substance, used in painting; so called from *Ombria*, the ancient name of the duchy of Spoleto in Italy, whence it was first obtained; diluted with water, it serves to make a dark brown colour, usually called with us an *hair colour*. Dr. Hill and Mr. da Costa consider it as an earth of the ochre kind. It is found in Egypt, Italy, Spain, and Germany; in Cyprus also it is found in large quantities; but what we have brought into England is principally from different parts of the Turkish dominions. But it might be found in considerable plenty also in England and Ireland, if properly looked after, several large masses of it having been thrown up in digging on Mendip hills in Somersetshire, and in the county of Wexford in Ireland: it is also sometimes found in the veins of lead-ore both in Derbyshire and Flintshire.

UMBILICAL, among anatomists, something relating to the umbilicus or navel.

UMBRELLA, a moveable canopy, made of silk or other cloth spread out upon ribs of whale-bone, and supported by a staff, to protect a person from rain, or the scorching beams of the sun.

UNCIA, in general, a Latin term, denoting the twelfth part of any thing; particularly the twelfth part of a pound, called in English an *ounce*; or the twelfth part of a foot, called an *inch*.

UNCTION, the act of anointing or rubbing with oil or other fatty matter.

UNCTION, in matters of religion, is used for the character conferred on sacred things by anointing them with oil. Unctions were very frequent among the Hebrews. They anointed both their kings and high-priests at the ceremony of their inauguration. They also anointed the sacred vessels of the tabernacle and temple, to sanctify and consecrate them to the service of God. The unction of kings is supposed to be a ceremony introduced very late among the Christian princes. It is said that none of the emperors were ever anointed before Justinian or Justin. The emperors of Germany took the practice from those of the eastern empire: King Pepin of France was the first who received the unction. In the ancient Christian church, unction always accompanied the ceremonies of baptism and confirmation. Extreme unction, or the anointing persons in the article of death, was also practised by the ancient Christians, in compliance with the precept of St. James, chap. v. 14th and 15th verses; and this extreme unction the Romish church has advanced to the dignity of a sacrament. It is administered to none but such as are affected with some mortal disease, or in a decrepit age. It is refused to impenitent persons, as also to criminals. The parts to be anointed are the eyes, the ears, the nostrils, the mouth, the hands, the feet, and the loins. The laity are anointed in the palms of the hands, but priests on the back of it; because the palms of their hands have been already consecrated by ordination. The oil with which the sick person is anointed represents the grace of God, which is poured down into the soul, and the prayer used at the time of anointing expresses the remission of sins thereby granted to the sick person; for the prayer is this: "By this holy unction, and his own most pious mercy, may the Almighty God forgive these wretched sins thou hast committed *by the fight*," when the eyes are anointed; *by the bearing*, when the ears are anointed; and so of the other senses.

UNDECAGON, is a regular polygon of eleven sides.

UNDECEMVIR, a magistrate among the ancient Athenians, who had ten other colleagues or associates joined with him in the same commission. The functions of the undecemviri at Athens were much the same as those of the late *prevois de marebaisse* in France. They took care of the apprehending of criminals; secured them in the hands of justice; and when they were condemned, took them again into custody; that the sentence might be executed on them. They were chosen by the tribes, each tribe naming its own; and as the number of the tribes after Callisthenes was but ten, which made ten numbers, a scribe or notary was added, which made the number eleven.

UNDERSTANDING. See **METAPHYSICS** and **LOGIC**.

UNDERWALD, a canton of Switzerland, and the fifth in rank. It is bounded on the north by the canton of Lucern and by the Lake of the Four Cantons, on the east by the high mountains which separate it from the Canton of Bern, and on the west by the canton of Bern. The religion of this canton is the Roman-catholic.

UNDERWOOD, is coppice, or any wood that is not accounted timber.

UNDULATION, in physics, a kind of tremulous motion or vibration observable in a liquid, whereby it alternately rises and falls like the waves of the sea.

UNGUENT, in medicine and surgery, a topical remedy

or composition, chiefly used in the dressing of wounds or blisters.

UNICORN, an animal famous among the ancients, and thought to be the same with the rhinoceros. See **RHINOCEROS**. Sparmann informs us, that the figure of the unicorn described by the ancients has been found delineated by the Senee Hotentots on the plain surface of a rock in Caffraria; and therefore conjectures, that such an animal either does exist at present in the internal parts of Africa, or at least once did so. Father Lobo affirms that he has seen it.

UNICORN-fish. See **MONODON**.

UNIFORM, denotes a thing to be similar, or consistent either with another thing, or with itself, in respect of figure, structure, proportion, or the like; in which sense it stands opposed to difform.

UNIFORMITY, regularity, a similitude or resemblance between the parts of a whole. Such is that we meet with in figures of many sides, and angles respectively equal, and answerable to each other. A late ingenious author makes beauty to consist in uniformity, joined or combined with variety. Where the uniformity is equal in two objects, the beauty, he contends, is as the variety; and where the variety is equal, the beauty is as the uniformity.

UNIFORMITY, is particularly used for one and the same form of public prayers, and administration of sacraments, and other rites, &c. of the church of England, prescribed by the famous stat. 1. Eliz. and 13 and 14 Car. II. cap. 4. called the *Act of Uniformity*. See **LITURGY**.

UNION, a junction, coalition, or assemblage, of two or more different things in one.

UNION, or *The Union*, by way of eminence, is more particularly used to express the act by which the two separate kingdoms of England and Scotland were incorporated into one, under the title of *The kingdom of Great Britain*. This union, in vain attempted by King James I. was at length effected in the year 1707, 6 Annæ, when 25 articles were agreed to by the parliament of both nations; the purport of the most considerable being as follows: 1. That on the first of May 1707, and for ever after, the kingdoms of England and Scotland shall be united into one kingdom, by the name of *Great Britain*. 2. The succession to the monarchy of Great Britain shall be the same as was before settled with regard to that of England. 3. The united kingdom shall be represented by one parliament. 4. There shall be a communication of all rights and privileges between the subjects of both kingdoms, except where it is otherwise agreed. 9. When England raises 2,000,000 l. by a land-tax, Scotland shall raise 48,000 l. 16, 17. The standards of the coin, of weights, and of measures, shall be reduced to those of England throughout the united kingdoms. 18. The laws relating to trade, customs, and the excise, shall be the same in Scotland as in England. But all the other laws of Scotland shall remain in force; but alterable by the parliament of Great Britain. Yet with this caution, that laws relating to public policy are alterable at the discretion of the parliament; laws relating to private right are not to be altered but for the evident utility of the people of Scotland. 22. Sixteen peers are to be chosen to represent the peerage of Scotland in parliament, and 45 members to sit in the house of commons. 23. The 16 peers of Scotland shall have all privileges of parliament; and all peers of Scotland shall be peers of Great Britain, and rank next after those of the same degree at the time of the union, and shall have all privileges of peers, except sitting in the house of lords, and voting on the trial of a peer.

These are the principal of the 25 articles of union, which are ratified and confirmed by statute 5 Ann. c. 8. in which

statute there are also two acts of parliament recited; the one of Scotland, whereby the church of Scotland, and also the four universities of that kingdom, are established for ever, and all succeeding sovereigns are to take an oath inviolably to maintain the same; the other of England, 5 Anne, c. 6. whereby the acts of uniformity of 13 Eliz. and 13 Car. II. (except as the same had been altered by parliament at that time), and all other acts then in force for the preservation of the church of England, are declared perpetual; and it is stipulated, that every subsequent king and queen shall take an oath inviolably to maintain the same within England, Ireland, Wales, and the town of Berwick upon Tweed. And it is enacted, that these two acts "shall for ever be observed as fundamental and essential conditions of the union."

Ireland has been recently united to Great Britain under certain specific articles, adapted to the convenience and welfare of both countries.

UNISON, in music. See INTERVAL.

UNIT, or UNITY, in arithmetic, the number one; or one single individual part of discrete quantity.

UNITARIANS, in ecclesiastical history, a name given to those who confine the glory and attribute of divinity to the One only great and supreme God, and Father of our Lord Jesus Christ.

UNITED BRETHREN, or UNITAS Fratrum, in ecclesiastical history, a church of which an account has been given under the word HERRNUT. Though the church of the United Brethren is episcopal, they consider episcopal ordination as necessary to qualify the servants of the church for their respective functions, they allow to their bishops no elevation of rank or pre-eminent authority; their church having from its first establishment been governed by synods, consisting of deputies from all the congregations; and by other subordinate bodies, which they call *conferences*. The synods, which are generally held once in seven years, are called together by the elders who were in the former synod appointed to superintend the whole unity. In the first sitting a president is chosen, and these elders lay down their office; but they do not withdraw from the assembly, for they, together with all bishops, *seniores civiles*, or lay-elders, and those ministers who have the general care or inspection of several congregations in one province, have seats in the synod without any particular election. The other members are, one or more deputies sent by each congregation, and such ministers or missionaries as are particularly called to attend. Women approved by the congregations are also admitted as hearers; and are called upon to give their advice in what relates to the ministerial labour among their sex; but they have no decisive vote in the synod. The votes of all the other members are equal.

In questions of importance, or of which the consequences cannot be foreseen, neither the majority of votes nor the unanimous consent of all present can decide; but recourse is had to the *lot*. For adopting this unusual mode of deciding in ecclesiastical affairs, the Brethren allege as reasons the practices of the ancient Jews and the apostles; the insufficiency of the human understanding amidst the best and purest intentions to decide for itself in what concerns the administration of Christ's kingdom; and their own confident reliance on the comfortable promises that the Lord Jesus will approve himself the head and ruler of his church. The *lot* is never made use of but after mature deliberation and fervent prayer; nor is any thing submitted to its decision, which does not, after being thoroughly weighed, appear to the assembly eligible in itself.

In every synod the inward and outward state of the unity, and the concerns of the congregations and missions, are taken into consideration. If errors in doctrine or deviations in prac-

tice have crept in, the synod endeavours not only to remove them, but by salutary regulations to prevent them for the future. It considers how many bishops are to be consecrated to fill up the vacancies occasioned by death; and every member of the synod gives his vote for such of the clergy as he thinks best qualified. Those who have the majority of votes are taken into the *lot*, and they who are approved are consecrated accordingly; but by consecration they are vested with no superiority over their Brethren, since it behoves him who is the greatest to be the servant of all.

Our limits will not permit us to give a systematic view of the doctrinal tenets of the Brethren. Though they acknowledge no other standard of truth than the sacred Scriptures, they adhere to the Augsburg Confession, and speak respectfully of the thirty-nine articles of the church of England. They profess to believe that the kingdom of Christ is not confined to any particular party, community, or church; and they consider themselves, though united in one body or visible church, as spiritually joined in the bond of Christian love to all who are taught of God, and belong to the universal church of Christ, however much they may differ in forms, which they deem non-essentials. But the reader who wishes to have a fuller account of this society of Christians, we must refer to *Cranes Ancient and Modern History of the Protestant Church of the United Brethren*, printed in London, 1783; and to a work intitled, *An Exposition of Christian Doctrine as taught in the Protestant Church of the United Brethren*, London, 1784.

UNITED PROVINCES of the NETHERLANDS, a republic of Europe, consisting of seven provinces, which extend 150 miles from N. to S. and 100 from E. to W. They are bounded on the W. and N. by the German Ocean, on the S. by Brabant and the bishopric of Liege, and on the E. by Germany. They rank in the following order: Guelderland, Holland, Zealand, Utrecht, Friesland, Overysel, and Groningen. Besides these provinces, are the lands of the Generality (including Dutch Brabant, Flanders, and Limburg), in which are the towns of Bois-le-Duc, Breda, Bergen-op-Zoom, Maastricht, Venlo, Sluys, and Hulst. This republic (which is likewise called by the general name of Holland) affords a striking proof, that perverting industry is capable of conquering every disadvantage of climate and situation. The air and water are nearly equally bad; the soil produces naturally scarcely any thing but turf; and the possession of this very soil is disputed by the ocean, which, rising considerably above the level of the land, is prevented from overflowing it, only by expensive dikes. Yet the labours of the patient Dutchman have rendered this small and seemingly insignificant territory, one of the richest spots in Europe, with respect to population and property. In other countries, possessed of a variety of natural productions, it is not surprising to find manufacturers employed in augmenting the riches which the bounty of the soil bestows; but to see, in a country like Holland, large woollen manufactures, where there are scarcely any flocks; numberless artists employed in metals, where there is not a mine; thousands of saw-mills, where there is scarcely a wood; an immense quantity of corn exported from a country where there is not agriculture sufficient to support one half of its inhabitants, is what must strike every attentive observer with admiration. Among the most valuable natural productions of the United Provinces may be reckoned their excellent cattle; and large quantities of madder are exported, chiefly cultivated in Zealand. The most considerable revenue arises from the fisheries; but these are not so considerable as formerly. The number of vessels employed in the herring fishery, in particular, is reduced from upward of 2000 to less than 200; and yet it maintains, even

now, no less than 20,000 people. About 100 vessels are employed in the Greenland fishery, and 140 in the cod fishery near the Dogger Bank, and near the coast of Holland. The Dutch were formerly in possession of the carrying trade of almost all other trading nations; and were also the bankers for all Europe. But these advantages did not continue to be so lucrative, when the other European nations began to open their eyes so far as to employ their own shipping in their trade, and to establish banks of their own. The Dutch trade, however, is still very great. In consequence of their vast opulence, they still regulate the exchange for all Europe, and their country is, as it were, the universal warehouse of the commodities of every quarter of the globe. Among the monopolies of their East-India Company, the spice trade is the most valuable; comprehending cloves, mace, nutmegs, and cinnamon. Their Asiatic possessions are the coasts of the island of Java, the capital of which is Batavia, the seat of the governor-general of all their East-India settlements; some settlements on the coasts of Sumatra, Malabar, and Coromandel; the greatest part of the Moluccas or Spice Islands; settlements of factories in the island of Celebes, at Surat, and Petra, and in the gulf of Persia; with Colombo, Trincomalee, &c. in Ceylon. In Africa, the Dutch have the Cape of Good Hope, with several forts and factories in Guinea; in the West Indies, St. Eustatia, Saba, and Curaçoa; and in South America, the colonies of Ilesquibo, Demerary, Surinam, and Berbice. But they have lost the Cape and some others of these in the present war. In the United Provinces, the inland trade is greatly facilitated by canals, which cross the country in every direction. The number of their manufactures is astonishing. Saardam, a village in North Holland, for instance, containing 900 windmills; namely, cornmills, saw and paper mills, mills for the making of white lead, &c. Since the year 1579, the Seven United Provinces must be considered as one political body, united for the preservation of the whole. In consequence of the Union (see NETHERLANDS) the Seven Provinces guaranty each other's rights; they make war and peace, levy taxes, &c. in their joint capacity; but as to internal government, each province is independent. They send deputies (chosen out of the provincial states) to the general assembly, called the states-general, which is invested with the supreme legislative power of the confederation. At the head of this government there has usually been a prince stadtholder, who exercises a considerable part of the executive power. After the death of William II. (the fourth stadtholder) in 1667, this office was abolished by the states; but, in 1672, when Lewis XIV. invaded Holland, the most violent popular commotions compelled them to repeal the edict; to invest William III. prince of Orange, with the office, and to declare it hereditary. On his death, in 1702, it was again abolished; but, in 1745, some popular commotions compelled the states, not only to invest William IV. prince of Orange, with this office, but again to declare it hereditary in his family. There have constantly been two opposite parties in the state; one of which, called the patriots, or the Louvetstein party, is averse, and the other attached to the power of the stadtholders. In 1787, a civil war actually commenced, and the stadtholder (William V. the present prince of Orange) was deprived of the office of captain-general; but he was restored, the same year, by the interference of Great Britain and Prussia. When the whole country, however, was rapidly overrun by the French, in January 1795, the stadtholder and his family were compelled to seek an asylum in England; the anti-stadtholderian party, now triumphant, proceeded to new-model the government, and, in particular, to abolish the stadtholderate; and the French, treating the Dutch as an independent state, concluded with them a treaty of alliance, offensive and defensive.

The Calvinist religion is established in the United Provinces; but most other Christian sects, and the Jews, are tolerated. Amsterdam is the capital; but the seat of the states-general is at the Hague. See SCHELDT.

UNITY, in poetry. There are three unities to be observed, viz. the unity of action, that of time, and that of place. In the epic poem, the great, and almost the only, unity, is that of the action. Some regard indeed ought to be had to that of time; for that of place there is no room. The unity of character is not reckoned among the unities. See POETRY.

UNIVERSE, a collective name, signifying the whole world; or the assemblage of heaven and earth, with all things therein. See ASTRONOMY and GEOGRAPHY.

UNIVERSITY, is the name of a corporation formed for the education of youth in the liberal arts and sciences, and authorized to admit such as have studied in it, to certain degrees in different faculties, which not only serve as certificates of proficiency in science, but also confer on those who obtain them considerable privileges within the university, as well as some rank in the state without it. Universities generally comprehend within them one or more colleges; but this is not always the case; for the university of St. Andrew's was in being before either of its colleges was founded, and it would continue in being with all its privileges though both its colleges were levelled with the dust.

In every university with which we are acquainted, there are four faculties, viz. *Theology*, *Law*, *Physic*, and the *Arts and Sciences*, comprehending mathematics, natural and moral philosophy, &c.; and in Oxford, Cambridge, and some other universities, *Musick* is considered as a fifth faculty. In each of these there are two degrees, those of *Bachelor* and *Doctor*; for though in the universities of Great Britain and Ireland we have no such degree as *Doctor in Arts and Sciences*, our *Master of Arts* answers to the degree of *Doctor in Philosophy*, which is conferred by many of the universities on the candidate.

Universities in their present form, and with their present privileges, are institutions comparatively modern. They sprang from the convents of regular clergy, or from the chapters of cathedrals in the church of Rome, where young men were educated for holy orders, in that dark period when the clergy possessed all the little erudition which was left in Europe. These convents were seminaries of learning probably from their first institution; and we know with certainty, that in Old Aberdeen there was a monastery in which youth were instructed in *theology*, the *canon-law*, and the *school philosophy*, at least 200 years before the University and King's College were founded. The same was doubtless the case in Oxford and Cambridge, and probably in every town in Europe where there is now a university, which has any claim to be called ancient; for it was not till the more eminent of the laity began to see the importance of literature and science, that universities distinct from convents were founded, with the privilege of admitting to degrees, which conferred some rank in civil society. These universities have long been considered as lay corporations; but as a proof that they had the ecclesiastical origin which we have assigned to them, it will be sufficient to observe, that the Pope arrogated to himself the right of vesting them with all their privileges; and that, prior to the Reformation, every university in Europe conferred its degrees in all the faculties by authority derived from a papal bull.

It is perhaps no improbable conjecture, that the church of Rome derived her idea of academical honours from the Jews, among whom literary distinctions extremely similar subsisted before the nativity of our Saviour. Among them, the young

udent, with respect to his learning, was called a *disciple*; from his minority a *junior*; and the *chosen* or *elect*, on account of his election into the number of disciples. When he had made some progress in knowledge, and was deemed worthy of a degree, he was by imposition of hands מַלְכוּת, *a companion to a Rabbi*, the person who officiates using this form, *I affiliate thee, or, Be thou affiliated*; and as soon afterwards as he was thought worthy to teach others, the *officiate* was raised to the rank of *Rabbi*. Whether this process suggested the idea or not; it has certainly some resemblance to that by which a young man in our universities passes through the degree of *Bachelor* to that of *Master of Arts* or *Doctor*.

The most ancient universities in Europe are those of OXFORD, CAMBRIDGE, PARIS, SALAMANCA, and BOLOGNA; and in the two English universities, the first-founded colleges are those of *University*, *Baliol*, and *Merton*, in the former, and *St. Peter's* in the latter. Oxford and Cambridge, however, were universities, or, as they were then called, *studies*, some hundreds of years before colleges or schools were built in them; for the former flourished as a seminary of learning in the reign of Alfred the Great, and the other, could we believe its partial partizans, at a period still earlier. The universities of Scotland are four, ST. ANDREW'S, GLASGOW, ABERDEEN, and EDINBURGH. In Ireland there is but one university, viz. that of DUBLIN, founded by Queen Elizabeth, and very richly endowed.

UNIVERSITY-COURTS, in England. The two universities enjoy the sole jurisdiction, in exclusion of the king's courts, over all civil actions and suits whatsoever, where a scholar or privileged person is one of the parties; excepting in such cases where the right of freehold is concerned. And then by the university charter they are at liberty to try and determine, either according to the common law of the land, or according to their own local customs, at their discretion; which has generally led them to carry on their process in a course much conformed to the civil law. This privilege, so far as it relates to civil causes, is exercised at Oxford in the chancellor's court; the judge of which is the vice-chancellor, his deputy, or assessor. From his sentence, an appeal lies to delegates appointed by the congregation; from thence to other delegates of the house of convocation; and if they all three concur in the same sentence, it is final, at least by the statutes of the university, according to the rule of the civil law. But if there be any discordance or variation in any of the three sentences, an appeal lies in the last resort to judges delegates appointed by the crown, under the great seal in chancery.

As to the jurisdiction of the university courts in criminal matters, the chancellor's court at Oxford, and probably also that of Cambridge, hath authority to try all offences or misdemeanors under the degree of treason, felony, or mayhem; and the trial of treason, felony, and mayhem, by a particular charter, is committed to the university jurisdiction in another court, namely, the court of the lord high-steward of the university. The process of the trial is this. The high-steward issues one precept to the sheriff of the county, who thereupon returns a panel of eighteen freeholders; and another precept to the bedells of the university, who thereupon return a panel of eighteen matriculated laymen, *laicos privilegio universitatis gaudentes*: and by a jury formed *de medietate*, half of freeholders and half matriculated persons, is the indictment to be tried; and that in the guildhall of the city of Oxford. And if execution be necessary to be awarded in consequence of finding the party guilty, the sheriff of the county must execute the university process; to which he is annually bound by an oath.

VOCABULARY, in grammar, denotes the collection of the words of a language, with their significations, otherwise

called a *dictionary*, *lexicon*, or *nomenclature*. See DICTIONARY. A vocabulary is properly a smaller kind of dictionary, which does not enter so minutely into the origin and different acceptations of words.

VOCAL, something that relates to the voice or speech; thus vocal music is that set to words, especially verses, and to be performed by the voice; in contradistinction to instrumental music, composed only for instruments, without singing.

VOCATIVE, in grammar, the fifth state or case of nouns. See GRAMMAR.

VOETIUS (Gisbert), an eminent divine of the 16th century, was professor of divinity and the oriental tongues at Utrecht, where he was also minister. He assisted at the synod of Dort; and died in 1676, aged eighty-seven. He wrote a great number of works; and was the declared enemy of Des Cartes and his philosophy. His followers are called *Voetians*. Voetius had two sons, *Daniel* and *Paul*, who also wrote several works. *John Voetius*, the son of Paul, was doctor and professor of law at Herborn: he wrote a commentary on the *Pandects*, which is esteemed; and other works on law.

VOICE, a sound produced in the throat and mouth of an animal, by an apparatus of instruments for that purpose. Voices are either articulate or inarticulate. Articulate voices are those whereof several conspire together to form some assemblage or little system of sounds: such are the voices expressing the letters of an alphabet, numbers of which joined together form words. Inarticulate voices are such as are not organized, or assembled into words; such is the barking of dogs, the braying of asses, the hissing of serpents, the singing of birds, &c. The formation of the human voice, with all the varieties thereof observed in speech, music, &c. makes a very curious article of inquiry; and the apparatus and organization of the parts administering thereto, is something exceedingly surprising. Those parts are the trachea or wind-pipe, through which the air passes and repasses into the lungs; the larynx, which is a short cylindrical canal at the head of the trachea; and the glottis, which is a little oval cleft or chink left between two semicircular membranes stretched horizontally within the larynx; which membranes, though capable of joining close together, do generally leave an interval, either greater or less, between them, called the *glottis*.

VOICE, in grammar, a circumstance in verbs, whereby they come to be considered as either active or passive, *i. e.* either expressing an action impressed on another subject, as, *I beat*; or receiving it from another, as, *I am beaten*. See GRAMMAR.

VOICE, in matters of election, denotes a vote or suffrage.

VOICE, in oratory. See DECLAMATION, READING, and ORATORY.

VOLANT, in heraldry, is when a bird, in a coat of arms, is drawn flying, or having its wings spread out.

VOLATILE, in physics, is commonly used to denote a mixed body, whose integrant parts are easily dissipated by fire or heat; but is more properly used for bodies whose parts are easily separated from each other, and dispersed in air.

VOLATILE *Alkali*, in the new French nomenclature *ammoniac*, one of the three alkaline salts. It consists, as Mr. Berthollet and several other chemists have proved, of 807 parts in 1000 of azot, and 193 of hydrogen. Several experiments, published by Dr. Priestley, led the way to this analysis, though he himself did not see their result. It is chiefly procurable from animal substances by distillation, during which process the azot and hydrogen necessary to its formation unite in proper proportions; it is not however procured pure by this process, being mixed with oil and water, and mostly saturated with carbonic acid. To separate these substances, it is first combined with an acid, the muriatic for instance, and then

disengaged from that combination by the addition of lime or pitch. In its greatest degree of purity it can only exist in a gaseous form, at least in the common temperature of the atmosphere. It was at first obtained chiefly from urine, and was therefore called *sal urine*; afterwards from horns, especially from those of the hart, hence its name, *sal cornu cervi*, "hart's horn." See CHEMISTRY.

VOLATILISATION, the art of rendering fixed bodies volatile, or of resolving them by fire into a fine subtil vapour or spirit which easily dissipates and flies away. All bodies, even the most fixed, as gold, may be volatilized, either of themselves, or with the admixture of some volatile substance or spirit, by distillation or sublimation.

VOLECANO, a name given to burning mountains, or to vents for subterraneous fires. The number of volcanoes with which we are at present acquainted is very considerable, not much less than 100. In Europe there are *Ætna*, *Vesuvius*, *Hecle*, *Stromboli*, *Vulcano*; in Asia, one in Mount *Taurus*, three in *Kamtchatka*, five in Japan, two in the Philippines, and a great number more scattered through the islands in the South Sea; in Africa, one in *Fez*, one in the island *Bourbon*, one in *Fuego*, one of the *Cape Verd* islands; and in America several in the *Andes*, *Morne Garou* in *St. Vincent*, and two discovered by Captain *Cook* on the western coast of North America. There are others, but these are best known.

It is remarkable that all the volcanoes with which we are acquainted, four or five perhaps excepted, are situated at a small distance from the sea. Most of them have been burning from time immemorial; some few however have burst out in our time. Volcanoes all occupy the tops of mountains, we find none of them in plains; some of them indeed, which are situated in the ocean, do not rise much above the surface; but even these volcanoes seem to be the apices of mountains, the greater part of which are covered by the sea. The substances ejected by volcanoes are fixed and inflammable air, water, ashes, pumice stones, stones that have undergone no fusion, and lava. The phenomena which take place during the eruptions of volcanoes have been so fully described already in the articles *ÆTNA*, *HECLE*, *ICELAND*, and *VESUVIUS*, that any repetition here would be unnecessary and improper. All that remains, therefore, is to explain the causes of volcanoes, or, to speak more properly, to mention the opinions of philosophers concerning the causes of volcanoes; for the real cause, we are afraid, after all that has been done, remains still unknown. The most elaborate theory that has yet appeared is that of Mr. *Houel*.

According to him, water is necessary for the formation of volcanoes. All volcanoes are near the sea: they are even extinguished when the sea retires from them, for we can still perceive the craters of volcanoes in several lofty inland mountains, which discover what they have been formerly. He supposes that a long series of ages was necessary for the formation of a volcano, and that they were all formed under the surface of the sea. The first explosion which laid open the foundations of the deep, would possibly be preceded by an earthquake. The waters would be parted by a vast globe of burning air, which would issue forth with a tremendous noise, opening at the same time a large and wide vent for the immense flame that was to follow; and which, as it issued from the bottom of the sea, would be spread over its surface by the first gusts of wind which followed. A fire which was to burn through thousands of years, could not be faint or feeble when it was first lighted up. Its first eruptions therefore have undoubtedly been very violent, and the ejected matter very copious. For a long series of ages it would continue to discharge torrents of lava from the bosom of its native earth;

and its first crater would be composed of the fragments of the same earth.

Thus, according to our author, the foundations of the burning mountain would be laid in the bottom of the sea; and even then it would have an hollow cup or crater on the top, similar to that which is to be found on all volcanoes at present. But the question now very naturally occurs, by what means was the internal fire preserved from extinction by the waters of the ocean, which must thus have been incumbent upon it? To this he replies, that "The fire, having disposed the substances in fusion to make an eruption, next laid open the earth, and emitted as much matter as it could discharge, with force sufficient to overcome the resistance of the column of water which would oppose its ascent; but as the strength of the fire diminished, the matter discharged was no longer expelled beyond the mouth; but, by accumulating there, soon closed up the orifice. Thus only small orifices would be left sufficient for giving vent to the vapours of the volcano, and from which only small bubbles of air could ascend to the surface of the water, until new circumstances, such as originally gave occasion to the eruption of the volcano, again took place in the bowels of the earth, and produced new eruptions either through the same or other mouths. The appearance of the sea over the new-formed volcano, in its state of tranquillity, would then be similar to what it is betwixt the islands of *Basilizzo* and *Paritaria*. Columns of air-bubbles are there ascending at the depth of more than 30 feet, and burst on their arriving at the surface. This air would continue to disengage itself with little disturbance as long as it issues forth only in small quantity, until, at the very instant of explosion, when prodigious quantities, generated in the burning focus, would make their way all at once, and the same phenomena which originally took place would again make their appearance."

A volcano, while under water, cannot act precisely as it does in the open air. Its eruptions, though equally strong, cannot extend to so great a distance. The lava accumulates in greater quantity round the crater; the sands, ashes, and *pozzolano*, are not carried away by the winds, but are deposited around its edges, and prevent the marine substances which are driven that way by the waters from entering. Thus they agglomerate with these bodies, and thus a pyramidal mount is formed of all the materials together.

In this manner Mr. *Houel* supposes that the mountain was gradually raised out of the sea by the accumulation of lava, &c. at every eruption, and that the cavern of the volcano was gradually enlarged, being driven down into the bottom of the cavern by the continued action of the stones which the volcano is constantly throwing up; that it was there fused, and at last thrown out at the top of the mountain to accumulate on its sides.

The pabulum by which the internal fire is supported, Mr. *Houel* thinks to be substances contained in the mountain itself, together with bitumen, sulphur, and other inflammable materials which may from time to time flow into the focus of the volcano in a melted state through subterraneous ducts, and the explosions he ascribes to water making its way in the same manner. The water is converted into steam, which fills the cavern, and pushes the melted lava out at the crater; this opinion is corroborated by the copious smoke which always precedes an eruption. But, combined with the water, there is always a quantity of other substances, whose effects precede, accompany, or follow the eruptions, and produce all the various phenomena which they display. The eruption of water from *Ætna*, in the year 1775, proceeded undoubtedly from this cause. The sea, or some of the reservoirs in *Ætna*, or the adjacent mountains, by some means discharged a vast quan-

thly of water into the focus of the volcano. That water was instantly resolved into vapour, which immediately filled the whole cavern, and issued from the mouth of the crater. As soon as it made its way into the open atmosphere, it was condensed again into water, which streamed down the sides of the mountain in a dreadful and destructive torrent.

Thus we have given a view of Mr. Houel's theory; according to which volcanoes originally began at the bottom of the sea; and not only the mountain, but all the adjoining country, was formed by successive eruptions. It is rather a theory of mountains raised by subterraneous heat than of volcanoes, and does not attempt to explain the origin of the fire, which is the principal difficulty; neither does his theory account for the immense height to which matters are sometimes thrown during eruptions. This indeed it is impossible to account for, without supposing that the resistance of the air is diminished.

Dr. Woodward and others, indeed, have had recourse to the hypothesis of a *central fire*, to which the volcanoes are only so many chimneys or spiracles; and Dr. Hutton, in his theory of the earth, adopts the same opinion; but as it did not immediately concern the subject of which he treated, he evades any question concerning its origin, by declaring himself satisfied of its existence without any enquiry into its origin.

Others, as Dr. Lister, have had recourse to the well-known experiment of the fermentation of sulphur and iron, which will take fire when mixed in considerable quantity, and moistened with water. Pyrites, therefore, which are a natural mixture of these two substances, it is supposed, may naturally give rise to volcanoes. Instances are indeed adduced, which undoubtedly prove that these substances will spontaneously take fire when thrown together in large heaps.

When the matter is properly considered, however, it must be evident, that neither of these hypotheses can answer the purpose. The central fire of Dr. Woodward and others is a cause too magnificent even for volcanoes. If any such fire is supposed, we must imagine a burning globe in the centre of the earth, whose heat is sufficient to vitrify the most solid and refractory terrestrial substances. But of what dimensions are we to suppose this globe? Is it one, two, three, four, or more thousands of miles in diameter?—Very large indeed it must be, for we could scarce suppose that fumes could be projected even from the depth of 500 miles into the air. But even this supposition is inadmissible; for as the fire of volcanoes is at times exceedingly augmented from some cause or other, were this cause general, as it must be in case of a burning central globe, the whole number of volcanoes existing on earth would be in a state of eruption at once. Besides, if we were to suppose a burning globe of 7000 miles in diameter to suffer the least dilatation throughout its vast bulk, which must be the undoubted consequence of an augmentation of heat from any unknown cause, all the volcanoes in the world would not be sufficient to give vent to it, though they should spout forth incessant cataracts of lava for centuries together. A dissolution of the whole globe must therefore undoubtedly take place; and though we should lessen the diameter of our burning globe by 1000 miles, our difficulties will be as far from being removed as before.

Volcanic fire, therefore, cannot originate from any general collection of burning materials dispersed throughout the vast mass of solid earth which lies betwixt the surface and the centre. All the volcanoes at present in an active state would not be such a vent for that fire as a tobacco-pipe would be to a glass-house furnace. We must have recourse then to some operation by which we know that nature can kindle and extinguish fires occasionally; and if we can suppose such an operation to take place in the bowels of the earth, we may then reasonably conclude, that we have discovered a cause adequate

to the production of volcanoes. Such a cause, however, cannot be pyrites, sulphur, or nitre, in any quantity under the surface of the earth. It is impossible that beds of pyrites can remain for thousands of years under the same part of the surface of the earth, be occasionally inflamed and ejected, and afterwards undergo a renovation, in order to enable them to go through a similar operation. Besides, neither pyrites nor sulphur can be inflamed without access of air; which cannot take place in the bowels of the earth; for it must be remembered, that the first question is concerning the means by which the fire was originally kindled. Most writers, however, seem to overlook this difficulty, and to be solicitous only about the immediate cause of the explosive force, which is generally ascribed to steam of one kind or other. Mr. Houel in general calls it the force of fire, or of steam; though he does not enter very particularly into its nature. Mr. Whitehurst says, that it is the force of "fire and water, which is the primary agent in all such operations of nature." He also gives a figure, showing how, by means of confined steam, a jet, either of hot water or of liquid fire, may be produced. But this applies only to a particular case, which we cannot suppose always to happen; but volcanoes are constantly attended with explosions; nay, so great is the tendency of volcanic matters to this violent operation, that many fumes have been observed to burst in the air like bombs, after they were thrown out of the volcano; and Mr. Houel even informs us, that such have burst three times during their flight. Water therefore cannot be always the cause of volcanic explosions. When thrown upon melted lead, salts, or especially copper, it explodes indeed with vast force. With the last-mentioned metal it is peculiarly and incredibly violent; inasmuch, that it is said that furnaces have been burst, and buildings thrown down, by the mere circumstance of some of the workmen pitting among the melted metal; and Mr. Whitehurst calculates the force of aqueous steam, when thus suddenly and violently heated, to be no less than twenty-eight times stronger than inflamed gunpowder.

Many philosophers attempt to account for the origin and continuance of volcanoes by the agency of the electric fluid; but their theory is so ill supported by facts, that we think it would be improper at present to take up room with detailing it.

VOLERY, a great bird-cage, so that the birds have room to fly up and down in it.

VOLGA, the largest river in Europe, rises in the forest of Volkonski, about eighty miles from Tver, a town in Russia. This noble river waters some of the finest provinces in the Russian empire, and at last falls into the Caspian Sea by several mouths, below Astracan.

VOLITION, the act of willing. See **METAPHYSICS**.

VOLLEY, a military salute, made by discharging a great number of fire-arms at the same time.

VOLONES, in Roman antiquity, slaves who in the Punic war voluntarily offered their service to the state, which is the reason of the appellation; upon which they were admitted to citizenship, as none but freemen could be soldiers.

VOLT, in the manège, a round or circular tread; and hence, by the phrase *to make volts*, is understood a gate of two treads, made by a horse going sidewise round a centre, in such a manner that these two treads make parallel tracts; one larger, made by the fore-feet, and another smaller made by the hind-feet; the croup approaching towards the centre, and the shoulders bearing out.

VOLTAIRE (Francis Arouet de); a celebrated French author, was born at Paris, February 20, 1694. His father, Francis Arouet, was *ancien notaire au Chatelet*, and treasurer of the chamber of accounts; his mother, Mary-Margaret Draumart. At the birth of this extraordinary man, who lived

to the age of eighty-five years and some months, there was little probability of his being reared, and for a considerable time he continued remarkably feeble. "In his earliest years he displayed a ready wit and a brightly imagination; and, as he said of himself, made verses before he was out of his cradle. He was educated, under Father Poré, in the college of Louis the Great; and such was his proficiency, that many of his essays are now existing, which, though written when he was between twelve and fourteen, show no marks of infancy. The famous Ninon de l'Enclos, to whom this ingenious boy was introduced, left him a legacy of 2000 livres to buy him a library. Having been sent to the equity schools on his quitting college, he was so disgusted with the dryness of the law, that he devoted himself entirely to the muses. He was admitted into the company of the Abbé Cheaulieu, the marquis de la Fare, the Duke de Sully, the grand prior of Vendôme, Marshal Villars, and the Chevalier du Bouillon; and caught from them that easy taste and delicate humour which distinguished the court of Louis XIV. Voltaire had early imbibed a turn for satire; and, for some Philipics against the government, was imprisoned almost a year in the Bastille. He had before this period produced the tragedy of *Oedipus*, which was represented in 1718 with great success; and the Duke of Orleans happening to see it performed, was so delighted, that he obtained his release from prison. The poet waiting on the duke to return thanks: "Be wife (said the duke), and I will take care of you." "I am infinitely obliged (replied the young man); but I intreat your royal highness not to trouble yourself any further about my lodging or board."

He began his *Henriade* before he was eighteen. Having one day read several cantos of this poem on a visit to his intimate friend, the young president de Maisons, he was so teased with objections, that he lost patience, and threw his manuscript into the fire. The president, Hénaut, with difficulty rescued it. "Remember," said Mr. Hénaut to him, in one of his letters, "it was I that saved the *Henriade*, and that it cost me a handsome pair of ruffles." Some years after, several copies of this poem having got abroad, while it was only a sketch, an edition of it was published, with many changes, under the title of *The League*. Instead of fame and friends, the author gained only enemies and mortification, by this first edition. The bigots took fire at it, and the poet was considered as highly criminal for praising Admiral Coligny and Queen Elizabeth. Endeavours were even used to get the piece suppressed; but this strange design proved abortive. His chagrin, on this occasion, first inspired him with the thought of visiting England, in order to finish the work, and republish it in a land of liberty. He was right; for King George I. and more particularly the Princess of Wales, afterwards queen of England, raised an immense subscription for him. Their liberality laid the foundation of his fortune; for on his return to France, in 1728, he put his money into a lottery established by M. Desfortes, comptroller-general of the finances. The adventurers received a rent charge on the *Hotel-de-Ville* for their tickets; and the prizes were paid in ready money; so that if a society had taken all the tickets, it would have gained a million of livres. He joined with a numerous company of adventurers, and was fortunate.

His *Lettres Philosophiques*, abounding in bold expressions and indecent witticisms against religion, having been burnt by a decree of the parliament of Paris, and a warrant being issued for apprehending the author in 1733, Voltaire very prudently withdrew; and was sheltered by the Marchioness du Chatelet, in her castle of Cirey, on the borders of Champagne and Lorraine, who entered with him on the study of the system of Leibnitz, and the Principia of Newton. A gallery was

built, in which Voltaire formed a good collection of natural history, and made an infinite number of experiments on light and electricity. He laboured in the mean time on his Elements of the Newtonian Philosophy, then totally unknown in France, and which the numerous admirers of Des Cartes were very little desirous should be known. In the midst of these philosophic pursuits he produced the tragedy of *Alzira*. He was now in the meridian of his age and genius, as was evident from the tragedy of *Mahomet*, first acted in 1741; but it was represented to the procureur-general, as a performance offensive to religion; and the author, by order of Cardinal Fleury, withdrew it from the stage. *Merope*, played two years after, 1743, gave an idea of a species of tragedy, of which few models had existed. It was at the representation of this tragedy that the pit and boxes were clamorous for a fight of the author; yet it was severely criticised when it came from the press. He now became a favourite at court, through the interest of Madame d'Etiole, afterwards Marchioness of Pampadour. He was appointed a gentleman of the bed-chamber in ordinary, and historiographer of France. He had frequently attempted to gain admittance into the Academy of Sciences, but could not obtain his wish, till 1746, when he was the first who broke through the absurd custom of filling an inaugural speech with the fulsome adulation of Richelieu; an example soon followed by other academicians. From the satires occasioned by this innovation, he felt so much uneasiness, that he was glad to retire with the Marchioness du Chatelet to Luneville, in the neighbourhood of King Stanislaus. The marchioness dying in 1749, Voltaire returned to Paris, where his stay was but short. The King of Prussia now gave Voltaire an invitation to live with him, which he accepted towards the end of August, 1750. On his arrival at Berlin, he was immediately presented with the *Order of Merit*, the *key of chamberlain*, and a pension of 20,000 livres. From the particular respect that was paid to him, his time was now spent in the most agreeable manner; his apartments were under those of the king, whom he was allowed to visit at stated hours, to read with him the best works of either ancient or modern authors, and to assist his majesty in the literary productions by which he relieved the cares of government. But a dispute which arose between him and Maupertuis soon brought on his disgrace. Maupertuis was at some pains to have it reported at court, that one day while General Manstein happened to be in the apartments of M. de Voltaire, who was then translating into French, The Memoirs of Russia, composed by that officer, the king, in his usual manner, sent a copy of verses to be examined, when Voltaire said to Manstein, "Let us leave off for the present, my friend; you see the king has sent me his dirty linen to wash, I will wash yours another time." A single word is sometimes sufficient to ruin a man at court; Maupertuis imputed such a word to Voltaire, and succeeded. It was about this very time that Maupertuis published his very strange Philosophical Letters; and M. de Voltaire did not fail to heighten, with his utmost powers of railery, everything which he found, or could make, ridiculous, in the projects of M. Maupertuis, who was careful to unite his own cause with that of the king: Voltaire was considered as having failed in respect to his majesty; and therefore, in the most respectful manner, he returned to the king his chamberlain's key, and the cross of his Order of Merit, accompanied with four lines of verse, in which he, with great delicacy, compares his situation to that of a jealous lover, who sends back the picture of his mistress. The king returned the key and the ribbon; but they were not followed by an immediate reconciliation. Voltaire set out to pay a visit to her highness the Duchess of Gotha, who honoured him with her friendship as long as she lived. While he remained at Go-

tha, Maupertuis employed all his batteries against him; Voltaire was arrested by the king's orders, but afterwards released.

He now settled near Geneva; but afterward being obliged to quit that republic, he purchased the castle of Ferney in France, about a league from the lake of Geneva. It was here that he undertook the defence of the celebrated family of Calas; and it was not long before he had a second opportunity of vindicating the innocence of another condemned family of the name of *Sirven*. It is somewhat remarkable, that in the year 1774, he had the third time a singular opportunity of employing that same zeal which he had the good fortune to display in the fatal catastrophe of the families of Calas and *Sirven*.

In this retreat M. Voltaire continued long to enjoy the pleasures of a rural life, accompanied with the admiration of a vast number of wits and philosophers throughout all Europe. Wearied at length, however, with his situation, or yielding to the importunities of friends, he came to Paris about the beginning of the year 1778, where he wrote a new tragedy called *Irene*. By this time his understanding seems to have been impaired, either through the infirmities of age, or continued intoxication by the flattery of others; and he ridiculously suffered himself to be crowned in public with laurel in testimony of his great poetical merit. He did not long survive this farce; for having overheated himself with receiving visits, and exhausted his spirits by supplying a perpetual fund of conversation, he was first seized with a spitting of blood; and at last becoming restless in the night-time, he was obliged to use a soporific medicine. Of this he unluckily one night took too large a dose, that he slept thirty-six hours, and expired a very short time after awakening from it.

VOLUME, in matters of literature, a book or writing of a just bulk to be bound by itself. The name is derived from the Latin *volvere*, "to roll up;" the ancient manner of making up books being in rolls of bark or parchment. See **Book**.

VOLUNTARY, in music, a piece played by a musician extempore, according to his fancy. This is often used before he begins to set himself to pay any particular composition, to try the instrument, and to lead him into the key of the piece he intends to perform.

VOLUNTEERS, persons who, of their own accord, either for the service of their prince, or out of the esteem they have for their general, serve in the army without being enlisted, to gain honour and preferment, by exposing themselves in the service. Such are the volunteers who have been long known in the army; but the present age has witnessed whole regiments of volunteers arming themselves for a still more laudable purpose—to fight *pro aris et focis*, for every thing that is dear to honest men.

VOLVOX, in zoology; a genus of animals belonging to the order of *vermes injuria*. The body is round, simple, and pellucid. There are ten species, all of which live in water.

VOLUSENUS. See **WILSON**.

VOLUTA, in natural history; a genus of animals belonging to the class and order of *vermes testacea*. There are 144 species. The animals are of the slug kind; the shell is unilocular and spiral; the aperture narrow and without a beak; the columella plaited.

VOLUTE, in architecture, a kind of spiral scroll used in the Ionic and Composite capitals, whereof it makes the principal characteristic and ornament.

VOMICA, in medicine, an abscess of the lungs. See **ME- DICINE**.

NEW VOMICA, in pharmacy, a flat compressed round fruit,

of the breadth of a shilling, or somewhat more, and of about the thickness of a crown-piece. It is the nucleus of a fruit of an East-Indian tree, the wood of which is the *lignum columbini* of the shops. Some have prescribed small doses of the nux vomica as a specific against a gonorrhœa, and others against quartan agues. But we have so many good and safe medicines for all these purposes, that there seems no occasion for our having recourse to such as these, which show so many signs of mischief.

VOMIT. See **EMETIC**.

VOMITING, a retrograde spasmodic motion of the muscular fibres of the œsophagus, stomach, and intestines, attended with strong convulsions of the muscles of the abdomen and diaphragm; which, when gentle, create a nausea; when violent, a vomiting.

VOORN, one of the islands of Holland, bounded by the river Maes, which divides it from the continent and the island of Idemunde, on the north; by the sea called the *Bies-bocht*, on the east; by another branch of the Maes, which divides it from the islands of Goree and Overflackee, on the south; and by the German Sea on the west: being about twenty-four miles long, and five broad.

VORTEX, in meteorology, a whirlwind, or sudden, rapid, and violent motion of the air in gyres, or circles. *Vortex* is also used for an eddy or whirlpool; or a body of water, in certain seas or rivers, which runs rapidly round, forming a sort of cavity in the middle.

VORTEX, in the Cartesian philosophy, is a system or collection of particles of matter moving the same way, and round the same axis.

VORTICELLO. See **MICROSCOPÉ**.

VOSSIUS (John Gerard), one of the most learned and laborious writers of the 17th century, was of a considerable family in the Netherlands; and was born in 1577, in the Palatinate, near Heidelberg, at a place where his father, John Vossius, was minister. He became well skilled in polite literature, history, and sacred and profane antiquities, and was made director of the college of Dort. He was at length made professor of eloquence and chronology at Leyden, from whence he was called in 1633 to Amsterdam, to fill the chair of a professor of history. He died in 1649. He wrote many learned works, of which a complete edition has been printed at Amsterdam, in 9 vols folio.

VOSSIUS (Isaac), a man of great parts and learning, the son of John Gerard Vossius, was born at Leyden in 1618. He had no other tutor but his father, and employed his whole life in studying; his merit recommended him to a correspondence with Queen Christina of Sweden; he made several journeys into Sweden by her order, and had the honour to teach her the Greek language. In 1670 he came over to England, where King Charles made him canon of Windsor; though he knew his character well enough to say, that there was nothing that Vossius refused to believe, except the Bible. He appears indeed by his publications, which are neither so useful nor so numerous as his father's, to have been a most credulous man, while he afforded many circumstances to bring his religious faith in question. He died at Windsor castle in 1688.

VOTE, the suffrage or resolve of each of the members of an assembly, where any affair is to be carried by a majority; but more particularly used for the resolves of the members of either house of parliament.

VOTIVE MEDALS, those on which are expressed the vows of the people for the emperors or empresses. See **MEDAL**.

VOW, a solemn and religious promise or oath. See **OATH**. The use of vows is found in most religions. They make up a

considerable part of the Pagan worship, being made either in consequence of some deliverance, under some pressing necessity, or for the success of some enterprize. Among the Jews, all vows were to be voluntary, and made by persons wholly in their own power; and if such person made a vow in any thing lawful and possible, he was obliged to fulfil it. If he appointed no particular time for accomplishing his vow, he was bound to do it instantly, lest by delay he should prove less able, or be unwilling, to execute his promise. Among the Romanists, a person is constituted a religious by taking three vows; that of poverty, chastity, and obedience. Vows, among the Romans, signified sacrifices, offerings, presents, and prayers made for the Cæsar, and emperors, particularly for their prosperity and the continuance of their empire. These were at first made every five years, then every fifteen, and afterwards every twenty, and were called *quinquennialia*, *decennialia*, and *vicennialia*.

VOWEL, in grammar, a letter which affords a complete sound of itself, or a letter so simple as only to need a bare opening of the mouth to make it heard, and to form a distinct voice. The vowels are six in number, viz. A, E, I, O, U, Y.

VOWEL (John). See HOOKER.

UPHOLSTER, UPHOLSTERER, or Upholder, a tradesman that makes beds, and all sorts of furniture thereunto belonging, &c.

UPLAND, denotes high ground, or, as some call it, *terra firma*, by which it stands opposed to such as is moorish, marshy, or low.

UPLAND, a province of Sweden, bounded on the north-east by the Baltic Sea, on the south by the sea of Sudermania, and on the west by Westmania and Gestricia, from which it is separated by the river Dela. It is about seventy miles in length and forty-five in breadth, and contains mines of iron and lead. Stockholm is the capital.

UPSAL, a rich and considerable city of Sweden, in Upland, with a famous university, and an archbishop's see. The town is pretty large, and as straight as a line: but most of the houses are of wood, covered with birch-bark, with turf on the top. On an eminence, to the south of the town, is a ruined castle. Those that view the town from hence would take it to be a garden, whose streets represent the alleys; and the houses, which are covered with turf, the grass-plats. It was formerly the residence of the kings, and is now the usual place where they are crowned. It is seated on the river Sala, over which there are two bridges. It is twenty-seven miles north-west of Stockholm. E. Long. 17. 48. N. Lat. 59. 52.

UPUFA, in ornithology; a genus belonging to the order of *Picæ*. The beak is arcuated, convex, and something blunt; the tongue is obtuse, triangular, entire, and very short; and the feet are fitted for walking. There are ten species; one of which, the *epops*, hoopoe, or dung-bird, is frequently seen in Britain. It may be readily distinguished from all others that visit this island by its beautiful crest, which it can erect or depress at pleasure. It is in length fifteen inches; the bill is black, two inches and a half long, slender, and incurved; the irides are hazel: the crest consists of a double row of feathers; the highest about two inches long; the tips are black, their lower part of a pale orange colour: the neck is of a pale reddish brown; the breast and belly white; the lesser coverts of the wings are of a light brown; the back, scapulars, and wings, crossed with broad bars of white and black; the rump is white; the tail consists of only ten feathers, white marked with black, in form of a crescent, the horns pointing towards the end of the feathers. The legs are short

and black; the exterior toe is closely united at the bottom to the middle toe.

According to Linnaeus, it takes its name from its note, which has a sound similar to the word; or it may be derived from the French *huppe*, or "crested:" it breeds in hollow trees, and lays two ash-coloured eggs: it feeds on insects, which it picks out of order of all kinds. Dr. Pallas affirms, that it breeds in preference in putrid carcases; and that he had seen the nest of one in the privy of an uninhabited house, in the suburbs of Tzaritzyn. Ovid says that Iereus was changed into this bird.

UR (anc. geog.), a citadel of Mesopotamia, situated between the Tigris and Euphrates; taken by some for Ur of the Chaldees, the residence of Abraham. What seems to confirm this is, that from Ur to Haran, the other residence of the patriarch, the road lies directly for Palestine. And it is no objection that Ur is said to be in Mesopotamia: because the parts next the Tigris were occupied by the Chaldeans, as seems to be confirmed from Acts vii. 2, 4. It is called *Orche*, in Strabo; *Orchoe*, in Ptolemy.

URALIAN CHAIN, a range of mountains which form part of the boundaries of Asia, and anciently known by the name of *Riphaei Montes*. See *RIPHAËI Montes*, &c.

URANIA, in fabulous history, one of the nine Muses, was supposed to preside over astronomy. She is commonly represented in an azure robe, crowned with stars, and supporting a large globe with both hands.

URANIUM, a fossil found at Johangeorgensstad in Saxony, and at Joachimsthal in Bohemia, and is, by the miners, called *Pechblend*. M. Werner, a German mineralogist, being convinced that it was not a blend, gave it the name of *terram Ochraceum Piccum*, and thought it contained the tungstic acid combined with iron: but M. Klaproth is of a contrary opinion, and maintains that it is very different from wolfram. There are (he says) two varieties of *pechblend*: the one is of a dark grey colour, with very little brilliancy, the particles of which have the form of a flattened cucurbit; it is not very hard, and when triturated, becomes a black powder: its mean specific gravity is 7.5. The other is distinguished by its black colour, though it sometimes assumes a reddish tint: its surface is more brilliant than that of the former, and resembles pit-coal; it is also less hard; and the black powder, to which it is reduced by trituration, has a greenish hue. This kind is generally discovered in compact masses, lying between strata of a micaceous schist, which is found to be decomposed. In the internal parts of this stone, it is not uncommon to meet with veins of a peculiar yellow metallic earth. The *pechblend* is soluble in the nitric and in the nitromuriatic acids, partially so in the muriatic, but not at all in the sulphuric. From these solutions, the unsaturated ferruginous prussiate of potash, or phlogisticated alkali, precipitates the metallic substance, which then resembles kermes mineral in colour. This, when it does not unite in flakes, but is uniformly dissolved in the solution, may be considered as one of the most distinguishing characters of the *pechblend*; another is, that the precipitates, effected by the volatile and fixed alkalis, are yellow; the fixed caustic alkalis giving it a lemon colour, the aerated a like yellow. This yellow oxyd, or calx, cannot be fused with alkalis. As this fossil cannot be classed either among the zinc or iron ores, and is very different from tungstene, M. Klaproth proposes to give to it the appellation of *Uranium*; and he distributes it into the following species:

1. *Uranium sulphuratum*. (a) Dark grey, often exhibiting traces of Galena. (b) Black, resembling pit-coal.
2. *Uranium Ochraceum*. Brimstone colour, lemon colour, deep yellow, reddish brown.

3. *Uranium Spathosum*. (a) Tinged with green by copper.
(b) Yellow. This is the green mica or chalcolithre.

URANOSCOPIUS, in ichthyology, a genus of fishes belonging to the order of *jugulares*. The head is large, rough, and depressed, the upper jaw being shorter than the under one; there are six dentated rays in the membrane of the gills; and the anus is in the middle of the body. There are two species, one of which is found in the Mediterranean Sea.

RAPHAEL D'URBINO. See **RAPHAEL**.

URCHIN, in zoology. See **ECHINUS**.

URETERS, in anatomy. See **ANATOMY**.

URETHRA, in anatomy. See **ANATOMY**.

URIM and THUMMIM, among the ancient Hebrews, a certain oracular manner of consulting God, which was done by the high priest dressed in his robes, and having on his pectoral or breast-plate. Various have been the sentiments of commentators concerning the urim and thummim. Josephus, and several others, maintain, that it meant the precious stones set in the high-priest's breast-plate, which by extraordinary lustre made known the will of God to those who consulted him. Spencer believes that the urim and thummim were two little golden figures shut up in the pectoral as in a purse, which gave responses with an articulate voice. In short, there are as many opinions concerning the urim and thummim as there are particular authors that wrote about them. The safest opinion, according to Broughton, seems to be, that the words *urim* and *thummim* signify some divine virtue and power annexed to the breast-plate of the high-priest, by which an oracular answer was obtained from God when he was consulted by the high-priest; and that this was called *urim* and *thummim*, to express the clearness and perfection which these oracular answers always carried with them; for *urim* signifies "light," and *thummim* "perfection;" these answers not being imperfect and ambiguous, like the heathen oracles, but clear and evident. The use made of the urim and thummim was to consult God in difficult cases relating to the whole state of Israel; and sometimes in cases relating to the king, the sanhedrim, the general of the army, or some other great personage.

URINAL, in medicine, a vessel fit to receive and hold urine, and used accordingly for the convenience of sick persons. It is usually of glass, and crooked.

URINAL, in chemistry, is an oblong glass vessel, closed for making solutions, and so called from its resemblance to the glasses in which urine is set to settle for the inspection of the physician.

URINE, a serous and saline fluid, separated from the blood, and carried by the emulgent arteries to the kidneys, from whence it descends to the bladder by the ureters, and is from time to time emitted thence by the canal of the urethra. See **ANATOMY**. For the analysis of urine, see **CHEMISTRY**, vol. II. p. 465.

URN, a kind of a vase, of a roundish form, but biggest in the middle, like the common pitchers, now seldom used but in the way of ornament over chimney-pieces, in beaufets, &c. The great use of urns among the ancients, was to preserve the ashes of the dead after they were burnt; for which reason they were called *cineraria*, and *urnae cinerarie*, and were placed sometimes under the tomb-stone whereon the epitaph was cut; and sometimes in vaults in their own houses. Urns were also used at their sacrifices to put liquid things in.

UROGALLUS, in ornithology. See **TETRAO**.

URSA, in astronomy, the name of two constellations in the northern hemisphere.

VOL. X.

URSULINES, in church-history, an order of nuns, founded originally by St. Angela of Brescia, in the year 1537; and so called from St. Ursula, to whom they were dedicated.

URSUS, the **BEAR**: a genus of quadrupeds belonging to the order of *Ferae*. There are six fore-teeth in the upper jaw, alternately hollow in the inside, and six in the under jaw, the two lateral ones being lobated. The dog-teeth are solitary and conical; the eyes are furnished with a nictitating membrane; the nose is prominent; and there is a crooked bone in the penis. There are eight species; the principal of which are,

1. *Arctos*, the black bear, has strong, thick, and clumsy limbs; very short tail; large feet; body covered with very long and shaggy hair, various in its colour; the largest are of a rusty brown; the smallest of a deep black: some from the confines of Russia black, mixed with white hairs, called by the Germans, *silver bear*; and some (but rarely) are found in Tartary of a pure white. It inhabits the north parts of Europe and Asia; the Alps of Switzerland, and Dauphine; Japan and Ceylon; North America and Peru. The brown bears are sometimes carnivorous, and will destroy cattle, and eat carrion; but their general food is roots, fruits, and vegetables: they will rob the fields of pease; and, when they are ripe, pluck great quantities up, beat the pease out of the hulks on some hard place, eat them, and carry off the straw: they will also, during winter, break into the farmer's yard, and make great havoc among his stock of oats; they are also particularly fond of honey. The flesh of a bear in autumn, when they are excessively fat, by feeding on acorns, and other mast, is delicate food; and that of the cubs still finer; but the paws of the old bears are reckoned the most exquisite morsel; the fat white, and very sweet; the oil excellent for strains and old pains. The latter end of autumn, after they have fattened themselves to the greatest degree, the bears withdraw to their dens, where they continue for a great number of days in total inactivity and abstinence from food, having no other nourishment than what they get by sucking their feet, where the fat lodges in great abundance: their retreats are either in cliffs of rocks, in the deepest recesses of the thickest woods; or in the hollows of ancient trees, which they ascend and descend with surprising agility: as they lay in no winter provisions, they are in a certain space of time forced from their retreats by hunger, and come out extremely lean: multitudes are killed annually in America, for the sake of their flesh or skin; which last makes a considerable article of commerce.

2. *Martimis*, the polar or white bear, has a long head and neck: short round ears; great teeth; the hair long, soft, and white, tinged in some parts with yellow; growing to a vast size; the skins of some being thirteen feet long. See Plate 2.

This animal is confined to the coldest part of the globe; it has been found as far as navigators have penetrated northwards, above lat. 80. The frigid climes only seem adapted to its nature; for we do not learn from any authority that it is met with farther south than Newfoundland. Its bounds in respect to longitude are also very limited; being an animal unknown except on the shores of Hudson's Bay, Greenland, and Spitzbergen, on one side, and those of Nova Zembla on the other; for such as have appeared in other parts have been brought there involuntarily on floating islands of ice; so that the intermediate countries of Norway and Iceland are acquainted with them but by accident. We cannot trace them farther east than Nova Zembla; though the frozen sea, that is continued from thence as far as the

land of Tschukfchi, that lies above Kamtschatka, is equally suited to their nature. The late histories of those countries are silent in respect to them.

During summer, the white bears are either resident on islands of ice, or passing from one to another: they swim admirably, and can continue that exercise six or seven leagues, and dive with great agility. They bring two young at a time: the affection between the parents and them is so strong, that they would die rather than desert one another. Their winter retreats are under the snow, in which they form deep dens, supported by pillars of the same. They feed on fish, seals, and the carcasses of whales, and on human bodies, which they will greedily tear up: they seem very fond of human blood; and are so fearless as to attack companies of armed men, and even to board small vessels. When on land, they live on birds and their eggs; and allured by the scent of seals' flesh, often break into and plunder the houses of the Greenlanders: their greatest enemy in the brute creation is the morse, with whom they have terrible conflicts, but are generally worsted, the vast teeth of the former giving it a superiority. The flesh is white, and said to taste like mutton: the fat is melted for train oil, and that of the feet used in medicine: but the liver is very unwholesome, as three of Barentz's sailors experienced, who fell dangerously ill on eating some of it boiled. One of this species was brought over to England a few years ago; it was very furious, almost always in motion, roared loud, and seemed very uneasy, except when cooled by having pauls of water poured on it.

3. The *luscus*, or wolverene, has a black sharp-pointed visage; short rounded ears, almost hid in the hairs; the sides of a yellowish brown, which passes in form of a band quite over the hind part of the back, above the tail; the legs are very strong, thick and short, of a deep black: the whole body is covered with very long and thick hair, which varies in colour according to the season. It inhabits Hudson's Bay and Canada, as far as the straits of Michilimackinac; is found under the name of the *glutton* in the north parts of Europe and Asia, being a native of the most rigorous climates.

It is a most voracious animal, and slow of foot; so is obliged to take its prey by surprise. In America it is called the *beaver-eater*, watching those animals as they come out of their houses, and sometimes breaking into their habitations, and devouring them. It often lurks on trees, and falls on the quadrupeds that pass under; will fasten on the horse, elk, or stag, and continue eating a hole into its body, till the animal falls down with the pain; or else will tear out its eyes: no force can disengage it; yet sometimes the deer in their agony have been known to destroy it, by running their head violently against a tree. It devours the fishes, or white fox; searches for the traps laid for the fables and other animals; and is often beforehand with the hunters, who sustain great losses by the glutton: authors have pretended that it feeds so voraciously, that at length it is in danger of bursting; and that it is obliged to ease itself of its load, by squeezing it out between two trees.

In a wild state, it is vastly fierce; a terror to both wolf and bear, which will not prey on it when they find it dead, perhaps on account of its being so very fetid, smelling like a pole-cat: it makes a strong resistance when attacked; will tear the flock from the gun, and pull the traps it is caught in to pieces. Notwithstanding this, it is capable of being tamed, and of learning several tricks. It burrows, and has its den under ground. The skin is sold in Siberia for 4s. or 6s.; at Jakutsk for 12s.; and still dearer at Kamtschatka,

where the women dress their hair with its white paws, which they esteem a great ornament. The fur is greatly esteemed in Europe: that of the north of Europe and Asia, whose skins are sometimes to be seen in the furriers' shops, is much finer, blacker, and more glossy than that of the wolverene, or American kind. The glutton has by some authors been confounded with the hyena.

4. The *lutor*, or raccoon, has the upper part of the body covered with hair, ash-coloured at the root, whitish in the middle, and tipped with black; tail very bushy, annulated with black; toes black, and quite divided.—It inhabits the warm and temperate parts of America: is found also in the mountains of Jamaica, and in the isles of Maria, between the south point of California and Cape Corientes, in the South Sea: is easily made tame, very good-natured, and sportive; but as unlucky as a monkey. It is almost always in motion; and very inquisitive, examining every thing with its paws. It makes use of them as hands; sits up to eat; is extremely fond of sweet things, and strong liquors, and will get excessively drunk. It has all the cunning of a fox; and very destructive to poultry; but will eat all sorts of fruits, green corn, &c. At low water it feeds much on oysters, and will watch their opening, and with its paw snatch out the fish; it sometimes is caught in the shell, and kept there till drowned by the coming in of the tide: it is also fond of crabs. It climbs very nimbly up trees. It is hunted for its skin; the fur is, next to that of the beaver for making hats.

5. The *mexles*, or common badger, is an animal of a very clumsy make, with short thick legs, long claws on the fore feet, and a fetid white matter exuding from the orifice below the tail. It inhabits most parts of Europe, as far north as Norway and Russia, and the step or desert beyond Orenburgh, in the Russian Asiatic dominions, north of the Caspian Sea: inhabits also China, and is often found in the butchers' shops in Peking, the Chinese being fond of them; but a scarce animal in most countries. It seldom appears in the day: confines itself much to its hole; is indolent and sleepy; generally very fat; feeds by night; eats roots, fruits, grass, insects, and frogs; but is not carnivorous: it runs slowly; when overtaken, it comes to bay, and defends itself vigorously; its bite is dangerous. It burrows under ground; makes several apartments, but forms only one entrance from the surface. It is hunted during night for the skin, which serves for pistol furniture; the hairs for making brushes to soften the shades in painting. Its flesh makes good bacon.

URTICA, in botany: a genus of plants of the class of *monocia*, and order of *tetrandria*; and in the natural system classed under the 53d order, *Scabridae*. The small flower has a calyx of four leaves; no corolla; a nectarium minute, central, urn-furnished. The female a bivalve calyx; and a single, oval glossy seed. There are twenty-eight species; three of which are British plants. 1. The *pilosissima*, Roman nettle, has a stalk branched, two or three feet high. Leaves opposite, oval, serrated, stinging. Fruit globose. 2. The *urens*, less stinging nettle, has a stem a foot high. Leaves roundish, deeply serrated, opposite, burning. The stings are very curious microscopic objects: they consist of an exceedingly fine pointed, tapering, hollow substance, with a perforation at the point, and a bag at the base. When the spring is pressed upon, it readily perforates the skin, and at the same time forces up some of the acrimonious liquor contained in the bag, into the wound. 3. The *dioica*, common nettle, has a square firm stem, three or four feet high. Leaves heart-shaped, long-pointed, serrated, beset with stings. Flowers in long,

catkins. The aculei, or stings of the nettle, have a small bladder at their base full of a burning corrosive liquor : when touched, they excite a blister, attended with a violent itching pain, though the sting does not appear to be tubular, or perforated at the top, nor any visible liquor to be infused into the puncture made by it in the flesh. It seems certain, however, that some of this liquor is insinuated into the wound, though invisibly, since the stings of the dried plant excite no pain.

Nettle-tops in the spring are often boiled and eaten by the common people instead of cabbage-greens. In Arran, and other islands, a rennet is made of a strong decoction of nettles : a quart of salt is put to three pints of the decoction, and bottled up for use. A common spoonful of this liquor will coagulate a large bowl of milk very readily and agreeably. The stalks of nettles are so like in quality to hemp, that in some parts of Europe and Siberia they have been manufactured into cloth, and paper has been made of them. The whole plant, particularly the root, is esteemed to be diuretic, and has been recommended in the jaundice and nephritic complaints. The roots boiled will dye yarn of a yellow colour. The larvae, or caterpillars, of many species of butterflies feed on the green plant ; and sheep and oxen will readily eat the dried.

UTICA-Marina. See *ANIMAL-Flower*.

USANCE, in commerce, is a determined time fixed for the payment of bills of exchange, reckoned either from the day of the bills being accepted, or from the day of their date ; and thus called because regulated by the usage and custom of the places whereon they are drawn.

USE, in law, the profit or benefit of lands and tenements ; or a trust and confidence reposed in a person for the holding of lands, &c. that he to whose use the trust is made shall receive the profits.

USHANT, an island of France, fifteen miles west of the coast of Brittany, at the entrance of the British Channel.

USHER (James), archbishop of Armagh, one of the most illustrious prelates in the 17th century, as well with respect to his piety and other virtues, as his uncommon erudition, was born in Dublin in 1580, and it is said that two of his aunts taught him to read, though they were both born blind. Dublin college being finished in 1593, he was one of the three first students admitted into it. He made so swift a progress in his studies, that at eighteen years of age he was able to dispute with Henry Fitz-Simon, a famous Jesuit, who challenged all the Protestant clergy ; and defended his cause so well in the castle of Dublin, that he made him repent his challenge. He was ordained priest in 1603 ; and soon after was appointed to preach constantly before the court at Christ-church in Dublin, on Sundays in the afternoon. In 1603 he was sent over to England with Dr. Luke Challoner, in order to purchase books for the library of Dublin. In 1607 he took the degree of bachelor of divinity ; soon after, he was made chancellor of St. Patrick's cathedral, and the same year was chosen professor of divinity, when he made choice of Bellarmine's controversies for the subject of his lectures. Some years after, he made it a constant custom to come over to England once in three years, spending one month of the summer at Oxford, another at Cambridge, and the rest of the time at London. In 1612 he took the degree of doctor of divinity ; at the latter end of the year 1620 he was promoted to the bishopric of Meath, and in 1625 was made archbishop of Armagh. In the administration of his archbishopric he acted in a very exemplary manner, and endeavoured to reform the clergy and officers in the ecclesiastical courts. In 1640 he came over to England with his family, with an intention soon to return to Ireland : but was prevented by the rebellion which broke out

there in 1641 ; and in that rebellion he was plundered of every thing, except his library, which was in England, and some furniture in his house at Drogheda. His majesty, therefore, conferred on him the bishopric of Carlisle, to be held *in commendam* : the revenues of which were greatly lessened by the Scots and Irish armies quartering upon it ; but when all the lands belonging to the bishoprics in England were seized by the parliament, they voted him a pension of 400*l.* *per annum*, though he never received it above once or twice. He afterwards removed to Oxford ; and, in 1643, was nominated one of the assembly of divines at Westminster, but refused to sit amongst them ; which, together with some of his sermons at Oxford, giving offence to the parliament, they ordered his study of books, of considerable value, to be seized ; but by the care of Dr. Featly, one of the assembly, they were secured for the primative's use. The king's affairs declined ; and Oxford being threatened with a siege, he left that city, and retired to Cardiff in Wales, to the house of Sir Timothy Tyrell, who had married his only daughter, and was then governor and general of the ordinance. He was afterwards invited to London by the Countess of Peterborough. In 1647 he was chosen preacher in Lincoln's-Inn ; and during the treaty in the life of Wight, he was sent for by the king, who consulted him about the government of the church. The death of his majesty struck him with great horror. The Countess of Peterborough's house, where the primate then lived, being just over against Charing Cross, several of her gentlemen and servants went up to the leads of the house, whence they could plainly see what was acting before Whitehall. As soon as his majesty came upon the scaffold, some of the household told the primative of it ; and asked him, whether he would see the king once more before he was put to death. He was at first unwilling, but at last went up : where, as the ceremonial advanced, the primative grew more and more affected ; and, when the executioners in vizards began to put up the king's hair, he swooned away. He died of a pleurisy in 1653 ; and was solemnly buried at Westminster, in St. Erasmus's chapel. He published. 1. *Britannicarum Ecclesiarum Antiquitates*. 2. *Polycarpi et Ignatii Epistolæ, Græcè Latine, &c.* 3. *Annals of the Old and New Testament, in Latin*. 4. *De Græcè Septuaginta interpretum Versione Syntagma* ; and many other books which are esteemed. A considerable number of his works still remain in manuscript.

USHER, an officer or servant who has the care and direction of the door of a court, hall, chamber, or the like.

USHER of the Black Rod, the eldest of the gentlemen ushers, daily waiters at court, whose duty it is to bear the rod before the king at the feast of St. George, and other solemnities.

USK, a river of Wales, which rises on the west of Brecknockshire, and runs south-east through that county and Monmouthshire, falling into the mouth of the Severn.

USQUEBAUGH, a strong compound liquor, chiefly taken by way of dram. There are several different methods of making this liquor ; but the following is esteemed one of the best : To two gallons of brandy, or other spirits, put a pound of Spanish liquorice, half a pound of raisins of the sun, four ounces of currants, and three of sliced dates ; the tops of baum, mint, savory, thyme, and the tops of the flowers of rosemary, of each two ounces ; cinnamon and mace, well bruised, nutmegs, anniseeds, and coriander-seeds, bruised likewise, of each four ounces ; of citron or lemon, and orange-peel, scraped, of each an ounce : let all these infuse forty-eight hours in a warm place, often shaking them together ; then let them stand in a cool place for a week : after which the clear liquor is to be decanted off, and to it is to be put an equal quantity of neat white port, and a gallon of canary ;

after which it is to be sweetened with a sufficient quantity of double-refined sugar.

USTION, in pharmacy, the preparing of certain substances by burning them.

USUFRUIT, in the civil law, the use or enjoyment of any lands or tenements; or the right of receiving the fruits and profits of an inheritance, or other thing, without a power of alienating or changing the property thereof.

USURIOUS CONTRACT, is any bargain or contract whereby a man is obliged to pay more interest for money than the statute allows.

USURPATION, in law, is an injurious using or enjoyment of a thing for continuance of time, that belongs of right to another.

USURY, an unlawful contract upon the loan of money, to receive the same again with exorbitant increase. Under the article **INTEREST**, it was observed, that by statute 37 Hen. VIII. c. 9. the rate of interest was fixed at 10l. per cent. per annum: which the statute 13 Eliz. c. 8. confirms, and ordains, that all brokers shall be guilty of a *premunire* that transact any contracts for more, and the securities themselves shall be void. The statute 21 Jac. I. c. 17. reduced interest to 8l. per cent.; and it having been lowered in 1650, during the usurpation, to 6l. per cent. the same reduction was re-enacted after the Restoration by statute 12 Car. II. c. 13. and, lastly, the statute 12 Annæ, ft. 2. c. 16. has reduced it to 5l. per cent. Wherefore not only all contracts for taking more are in themselves totally void, but also the lender shall forfeit treble the money borrowed. Also if any scrivener or broker takes more than 5s. per cent. procuration-money, or more than 12 d. for making a bond, he shall forfeit 20l. with costs, and shall suffer imprisonment for half a year.

UTERUS, in anatomy. See **ANATOMY**.

UTICA (anc. geog.), a town of Africa Propria, on the Mediterranean: a Tyrian colony, and older than Carthage (Sil. Italicus); its name, according to Bochart, denoting *old*: reckoned second to it; but after the destruction of Carthage, became the capital and centre of all the Roman transactions in Africa, according to Strabo; who adds, that it stood on the same bay with Carthage, at one of the promontories called *Apollonium*, bounding the bay on the west side, the other to the east called *Hermia*, being at Carthage. It became famous by the death of Cato, who thence was called *Uticensis*.

UTRECHT, one of the United Dutch States, which, excepting in one small strip of land to the northward, and bordering on the Zuder Sea, is wholly environed by Holland and Guelderland: it enjoys a good air, and, in most parts, the soil is very fruitful; to the eastward, it is, indeed, a high and sterile country, consisting either of sandy hills, or small eminences, which are, in general, over-run with woods; and westward the country perfectly resembles Holland, being for the most part rich meadow, though in many parts full of turf grounds. In the state of Utrecht, are seventy towns and villages. Its states are composed of the clergy, the nobility, and the towns; of these the former are merely nominals. The second class is composed of the nobility, who, on account of their manors, are called to the assembly of the states. The third class consists of the deputies of the five towns of Utrecht, Amersfoort, Wyk, Rhenen, and Montfoort, but more particularly of the first; nay, in consultations, that city even asserts that the other four towns have only one vote; and so far is certain, that Utrecht can control the sentiments of the rest; but the resolutions taken by it, may not be traversed by the others. This country, together with Overysel, once constituted the temporal dominion of the bishop of Utrecht, the

first of whom was Willibrord, who being collated at Rome in the year 696, by Pope Sergius, founded the church of Willenburgh or Utrecht: its prelate was elected by the five chapters of the latter, who were also not without some share in the government; but Henry of Bavaria, the last bishop, who held that office jointly with the ecclesiastical jurisdiction, being a man of a turbulent spirit, drew on him frequent tumults, and at length the principal of his subjects entered into a secret league with Charles duke of Guelderland, who marched out an armed force against him; and the latter being unable to withstand the duke, in 1528, sold his whole diocese or temporal dominion, together with the absolute sovereignty thereof, to the Emperor Charles V. who annexed it as a lordship to the estates of the house of Austria, under which it continued till the reign of his son Philip II. when, in 1579, by its alliance with the other Netherland provinces, who asserted their liberty, it became a free state. The above-mentioned bishop Henry of Bavaria, had three successors as bishop of Utrecht, of whom Frederick baron Schenk of Tautenberg, was in 1559, by King Philip II. created archbishop, and the bishops of Leiwarden, Deventer, Groningen, Haarlem, and Middleburg, made his suffragans; but since the above, all the bishops of Utrecht have forfeited all share in the temporal government. The college of the deputies of this state consists of twelve members, each class of the states sending four; the chamber of accounts is under the direction of four commissioners; and the provincial court of justice is composed of a president, six ordinary and three extraordinary assessors; to the assembly of the States-General it sends three deputies, that is to say, one from each class of its states. The Calvinist congregations are divided into three classes, namely, into those of Utrecht, Amersfoort, and Rhenen, with Wyk, and the number of ministers here, is seventy-nine, the synod is held once a-year at Utrecht. The Roman-catholics have above thirty churches in this state. The Lutherans, the Remonstrants, and the Anabaptists, are but few.

UTRECHT, a city, and capital of the state so called; in Latin *Utrajectum*, *Trajectum Inferius*, *Trajectum*, *Utrivencium*, *Antonina Civitas*, which last name was given it from Antoninus, a Roman senator, by whom it was built, in the time of Nero; and *Trajectum ad Rhenum*, to distinguish it from Maestricht, which was called *Trajectum ad Mosam*. It is a handsome, large, and rich city, situated on the ancient Rhine. The Wiltes ruined it, and left nothing but the castle, which they called *Willenbourg*. In the year 718, Clotaire king of France rebuilt it, and first called it Utrecht, from the word *Trecht*, which signifies passage, because it was the grand passage over the Rhine, before that river had changed its bed. It was enlarged, and surrounded with walls about the year 934, by Balderic de Cleves, the fifteenth bishop. Its figure is oval, and is about a league and a quarter in circumference, besides four large faubourgs; but though fortified with some bastions and half-moons, it is not strong. The emperor Charles V. when he became master of the signiory and city of Utrecht, in the year 1529, built a chateau, which he called *Vrebourg*, or the *chateau of Peace*; and in the year 1546, celebrated a chapter of the order of the Golden Fleece, in the cathedral church, when Maximilian king of Bohemia, and afterwards emperor, Cosmo duke of Florence, Albert duke of Bavaria, Emanuel Philibert duke of Savoy, and eighteen other lords, were installed knights. The dome, or the cathedral church, it is said, was first built in the year 630, by King Dagobert I. and St. Willibrord made it an abbey church, and soon after it became a cathedral. It was rebuilt by Adolboldee, the nineteenth bishop, and by him consecrated in the year 1024, in the presence of the emperor, Henry II. the

Duke of Brabant, the Comptes of Holland, Guddres, Cleves, and Cuyck, and twelve bishops. In the year 1224 it was again begun to be rebuilt by Henry de Vianen, the thirty-eighth bishop, and finished by his successors. The height of the tower is three hundred and eighty eight feet, and from the top, in a clear day, fifteen or sixteen cities may be seen. The cathedral was at first dedicated to St. Thomas, afterwards to St. Martin. The church of Notre-Dame, commonly called *Buur-Kerk*, and English church, has a small library, which contains some ancient manuscripts; the other parishes are St. James, St. Nicholas, and St. Gertrude. It has likewise hospitals for orphans, foundlings, &c. Before the reformation, it had many religious houses. The magistracy is composed of a grand bailly, two burgomasters, twelve echevins, a treasurer, an intendant of buildings, a president, three commissioners of finances, and a senator, which are changed every year on the 12th of October, and hold their assemblies in the town-house, which is a handsome structure. On the 13th of January 1577, the troops of the States-General besieged the Spaniards in the castle and obliged them to surrender; the Count de Boffin, who was then in the interest of the Hollanders, ordered the castle to be razed, on the fourth of September, in the same year. In the year 1672, the French made themselves masters of it; and his most Christian majesty entered it in state, in the month of July, accompanied by the Duke of Orleans, and the Duke of Monmouth; but on the 13th of November, the Duke of Luxemburg, who had been appointed governor, abandoned the city and the whole province, after having compelled them to pay four hundred and fifty thousand livres. The principal streets are cut through with canals, two of which run through the whole city, namely, the Vaert, and the new Gracht, over which there are thirty five bridges. These are the principal canals of the town, and the buildings on the banks of the new Gracht are magnificent. The market-place is very large, and the centre of several handsome streets. The houses are of brick, and many of them stately; they have in general good cellars, which they cannot have in the state of Holland, the ground there being too marshy. Without the town there are beautiful rows of trees, to which the English have given the name of the Mall, by reason of their having some resemblance to St. James's Park. This place was the seat of an archbishop, before it fell into the Protestants' hands, and had four collegiate churches, two commanderies, and several abbeys, which have been all secularized by the States, and applied to other uses. As it stands in a very healthful air, it is frequented by persons of distinction, who have very fine houses in this city. The university is very famous, and attracts a great number of foreigners, among the rest some English, who resort hither for their education. It was originally only a public school, founded by David of Burgundy, bishop of Utrecht; but in the year 1636 it was converted into an university by the States. The university is subject to the magistrates of the city, and has not a great many privileges to boast of. The students wear their ordinary dres, and board in private houses in the town, for there are scarcely any endowed colleges in Holland. Here the states of the province assemble to take cognizance of the affairs of the whole province. There is a public library, well stocked with books in all branches of learning. The town-house is a very noble building. The painters' hall abounds with fine pieces: they have also a physic garden, but of no great note. The town is famous for the treaty of union, signed in 1579, between the Seven Provinces, which laid the foundation of the republic; as likewise for the treaty of peace, signed here in 1713, between France and the Grand Allies. Utrecht gave birth to Pope Adrian VI. whole

VOL. X.

house they always show to foreigners, and to the celebrated Ann Mary Schurman, so admired in the last century for her learning; eighteen miles south-south-east Amsterdam. Long. 22, 32. E. Ferro. Lat. 52. 6. N.

UTRICULARIA, in botany: a genus of plants of the class of *dianthia*, and order of *monogynia*; and in the natural system arranged under the 24th order, *Corydalis*. The calyx is ringent, with a nectarium resembling a spur; the corolla disphyllous and equal; the capsule unilocular. There are nine species; two of which are natives of Britain. They have been applied to no particular use.

UVA URSI. See ARBUTUS.

VULCAN, in Pagan worship, the god of subterraneous fire and metals, was the son of Jupiter, and Juno; and was said to be so remarkably deformed, that his father threw him down from heaven to the isle of Lemnos, in which fall he broke his leg, and there he set up his forge, and taught men how to soften and polish brass and iron. Thence he removed to the Liparian isles, near Sicily, where, by the assistance of the Cyclops, he made Jupiter's thunderbolts, and armour for the other gods. Notwithstanding the deformity of his person, he had a passion for Minerva, and by Jupiter's consent made his addresses to her, but without success. He was, however, more fortunate in his suit to Venus; who, after her marriage, chose Mars for her gallant; when Vulcan exposed them to the ridicule of the other gods, by taking them in a net.

VULGATE, a very ancient Latin translation of the Bible, and the only one acknowledged by the church of Rome to be authentic. See BIBLE.

VURNERARY, in medicine, an epithet formerly given to remedies supposed to possess virtues for the cure of wounds and ulcers.

VULTURE, a genus of birds belonging to the order of *Accipitres*. The beak is straight and crooked at the point; the head has no feathers; on the fore-part being only naked skin; and the tongue is generally bifid. There are twenty-one species. The most remarkable are,

1. *Gryphus*, the condor, which is not only the largest of this genus, but perhaps of all others which are able to fly. The accounts of authors in regard to the strength of this bird, and its extent of wing, are various. From nine to eighteen feet from the tip of one wing to that of the other has been mentioned; and one gives it strength sufficient to carry off sheep, and boys of ten years old; while another ventures to affirm, that it can lift an elephant from the ground high enough to kill it by the fall! However, the account given in Cook's Voyage is very nearly, if not precisely, the truth, as two birds of this kind are now in the museum of Mr. Parkinson, and are probably male and female. The first of these has an extent of wing somewhat under eleven feet. The bill is strong, moderately hooked, and blunt at the tip, which is white, the rest of it being of a dusky colour. On the top of the head runs a kind of carunculated substance, standing up like the comb of a cock. The head and neck are slightly covered with brown down, in some parts nearly bare, and here and there a carunculated part, as in the neck of a turkey. The lower part of the neck is surrounded with a ruff of a pure white and hairy kind of feathers. The upper parts of the body, wing, and garl, are black, except that the middle wing coverts have whitish ends, and the greater coverts half black half white. The nine or ten first quills are black, the rest white, with the tips only black; and when the wings are closed, producing the appearance of the bird having the back white; giving occasion to Molrué, in his History of Chili, to say, that the back was white. The under

parts of the body are rather slightly covered with feathers; but those of the thighs are pretty long. The legs are stout and brown; claws black and blunt.

The second bird chiefly differs in not having the least appearance of a comb or crest, but smooth for the most part, except where the head and neck are covered with down. The ruff on the lower part of the neck is not so full and conspicuous; but as to the colour of the plumage, the difference is not worth noticing. It is not impossible that this last may prove to be a young male, for Moluc expressly says, that the female is smaller than the male, of a brown colour, and has no ruff about the neck, only a small tuft at the back part.

These birds are said to make their nests among the inaccessible rocks, and to lay two white eggs, larger than those of a turkey; are very destructive to sheep, and will in troops often attempt calves; in which case, some of them first pick out the eyes, whilst others attack the poor animal on all sides, and soon tear him to pieces. This gives rise to the following stratagem, used by the peasants of Chili: one of them wraps himself up in the hide of a fresh killed sheep or ox, and lies still on the ground; the condor, supposing it to be lawful prey, flies down to secure it, when the person concealed lays hold of the legs of the bird, his hands being well covered with gloves; and immediately his comrades, who are concealed at a distance, run in, and assist to secure the depredator, by falling on him with sticks till they have killed him. See Plate 2.

2. The *perenopterus*, or Egyptian vulture. The appearance of this bird is as horrid as can well be imagined, viz. the face is naked and wrinkled; the eyes are large and black; the beak black and hooked; the talons large, and extending ready for prey; and the whole body polluted with filth: these are qualities enough to make the beholder shudder with horror. Notwithstanding this, the inhabitants of Egypt cannot be enough thankful to Providence for this bird. All the places round Cairo are filled with the dead bodies of asses and camels; and thousands of these birds fly about, and devour the carcases before they putrify and fill the air with noxious exhalations. The inhabitants of Egypt, and after them Maillet in his Description of Egypt, say, that they yearly follow the caravan to Mecca, and devour the filth of the slaughtered beasts, and the carcases of the camels which die on the journey. They do not fly high, nor are they afraid of men. If one is killed, all the rest surround him in the same manner as do the roystering crows; they do not quit the places they frequent, though frightened by the explosion of a gun, but immediately return thither. Maillet imagines this bird to be the ibis of the ancients: but it is scarcely to be imagined, that a wise nation should pay such honours to an unclean, impure, and rapacious bird, which was not perhaps so common before the Egyptians filled the streets with carcases. If the ibis is to be found, it must certainly be looked for in the order of grallæ of Linnæus; and we imagine it to be the white stork (*Ardea ciconia*), which is so common in Egypt. The Arabians call it *rochemie*; the French living in Egypt, give it the name of *chapon de Pharaon*, or de Mahometh.

3. The *aura*, or carrion vulture, according to Mr. Latham, is about the size of a turkey, though it varies in size in different parts. The bill is white; the end black; irides bluish saffron colour. The head, and part of the neck, are bare of feathers; and of a red, or rather rufous colour. The sides of the head warted, not unlike that of a turkey. The whole plumage is brown black, with a purple and green gloss in different reflections; but in some birds, especially young ones, greatly verging to dirty brown. The feathers of the quills and tail are blacker than the rest of the body. The legs are flesh-colour; the claws black.

This bird is very common in the West Indies, and both in North and South America. It feeds on dead carcases, snakes, &c. like most of this genus; which makes the smell of it very offensive. In general, it is very tame in its wild state, but particularly so when trained up from being young. This our author experienced in two birds sent home from Jamaica. They were suffered to run wild about the garden, and were alert and brisk during the summer months; but impatient of the least cold; for a rainy day, with the slightest degree of cold, obliged them to creep for shelter. In the West Indies, they roost together of nights, in vast numbers, like rooks in this country. They are reckoned a most useful animal in the places where they resort; which secures their safety, added to a penalty for killing one, which is in force in Jamaica, and other islands of the West Indies.

4. The *fagittarius*, or secretary, is a most singular species, being particularly remarkable from the great length of its legs; which at first sight would induce one to think it belonged to waders: but the characters of the vulture are so strongly marked throughout, as to leave no doubt to which class it belongs. The bird, when standing erect, is full three feet from the top of the head to the ground. The bill is black, sharp, and crooked, like that of an eagle; the head, neck, breast, and upper parts of the body, are of a bluish ashy-colour: the legs are very long, shorter than those of a heron, and of a brown colour; claws shortish, but crooked, not very sharp, and of a black colour; from the hind-head springs a number of long feathers, which hang loose behind like a pendent crest; these feathers arise by pairs, and are longer as they are lower down on the neck; this crest the bird can erect or depress at pleasure; it is of a dark colour, almost black; the webs are equal on both sides, and rather curled; and the feathers, when erected, somewhat incline towards the neck; the two middle feathers of the tail twice as long as any of the rest. This singular species inhabits the internal parts of Africa, and is frequently seen at the Cape of Good Hope. It is also met with in the Philippine islands.

The description was taken by Mr. Latham from three that were alike, which he saw in England alive some years since; two of which are now in the Leverian museum. From confinement they had lost their two long tail feathers; but this want was supplied by some accurate drawings by Sir Joseph Banks, taken from the life at the Cape.

As to the manners of this bird, it is on all hands allowed that it principally feeds on rats, lizards, snakes, and the like; and that it will become familiar: whence Sonnerat is of opinion, that it might be made useful in some of our colonies, if encouraged, towards the destruction of those pests. They call it at the Cape of Good Hope *flangateer*, i. e. snake eater. A great peculiarity belongs to it, i. perhaps observed in no other; which is, the faculty of striking forwards with its legs, never backwards. Dr. Solander saw one of these birds take up a snake, small tortoise, or such like, in its claws; when dashing it from thence against the ground with great violence, if the victim was not killed at first, it repeated the operation till that end was answered; after which it ate it up quietly. Dr. J. R. Forster mentioned a further circumstance, which he says was supposed to be peculiar to this bird; that should it by any accident break the leg, the bone would never unite again.

UVULA, in anatomy. See ANATOMY.

UZ, or URZ, the country and place of residence of Job. In the genealogy of the patriarchs there are three persons called Uz, either of which might give this district its name. The first was the grandson of Sem, by his son Aram (Gen. xxii. 23.), who, according to Josephus, occupied the Trachonitis, and Damascus, to the north of Palestine: but Job was

among the sons of the East. Another *Uz* was the son of Nahor, Abraham's brother (Gen. x. 21.), who appears to have removed, after passing the Euphrates, from Haran of Melopotamia to Arabia Deserta. The third *Uz* was a Horite, from mount Seir (Gen. xxxvi. 28.), and thus not of Eber's posterity. Now the question is, from which of these Job's country, *Uz*, took its name? Not from the first, as is already shown; nor from the second, because his country is always called *Seir*, or *Edom*, never *Uz*; and then called a

South, not an *east*, country, in Scripture. It therefore remains, that we look for the country and place of residence of Job in Arabia Deserta; for which there was very probable reason. The plunderers of Job are called *Chaldeans* and *Sabeans*, next neighbours to him. These Sabeans came not from Arabia Felix, but from a nearer Sabe in Arabia Deserta (Ptolentyn) and his friends, except Eliphaz the Themanite, were of Arabia Deserta.

UZBECK TARTARY. See TARTARY.

W.

W A G

W or *w*, is the 21st letter of our alphabet; and is composed, as its name implies, of two *v*'s. It was not in use among the Hebrews, Greeks, or Romans; but chiefly peculiar to the northern nations, the Teutones, Saxons, Britons, &c. But still it is not used by the French, Italians, Spaniards, or Portuguese, except in proper names, and other terms borrowed from languages in which it is originally used, and even then it is founded like the single *v*. This letter is of an ambiguous nature; being a consonant at the beginning of words, and a vowel at the end. It may stand before all the vowels except *a*; as *water*, *wedge*, *winter*, *wonder*: it may also follow the vowels *a*, *e*, *i*, and unites with them into a kind of double vowel, or diphthong; as in *saw*, *few*, *cow*, &c. It also goes before *r*, and follows *i* and *u*; as in *with*, *fewer*, *thwart*: it goes before *b* also, though in reality it is founded after it; as in *woven*, *what*, &c. In some words it is obscure, as in *shadow*, *widow*, &c.

WAAG, a river of Hungary, which rises in the Carpathian mountains, and falls into the Danube opposite to the island of Schut.

WAAL, a river of the United Netherlands, being one of the branches of the Rhine, which runs from east to west, through Guelderland, passing by Nimeguen, Tiel, Bommel, and Gorcum; and, uniting with the Maes, falls into the German Sea below the Briel.

WACHENDORFIA, in botany: a genus of plants of the class of *triandria*, and order of *monogynia*; and arranged in Linnaeus's Natural Method of Classification under the 6th order, *Infusae*. The corolla is hexapetalous, unequal, and situated below the germen; the capsule trilobular and superior. There are four species; none of which are natives of Britain.

WADD, or WAPPING, is a fustle of paper, hay, straw, or the like, forced into a gun upon the powder, to keep it close in the chamber; or to put up close to the shot, to keep it from rolling out.

WAFERS, for sealing letters, are made thus: Take very fine flour, mix it with glair of eggs, singlals, and a little yeast; mingle the materials; beat them well together; spread the batter, being made thin with gum-water, on even tin plates, and dry them in a stove; then cut them out for use. You may tinge the paste with vermilion for red; indigo or verditer, &c. for blue; saffron, turmeric, or gamboge, &c. for yellow.

WAGER of Law. See (*Wager of*) LAW.

WAGER of Battel. See (*Wager of*) BATTEL.

W A I

WAGGON, a wheel carriage, of which there are various forms, accommodated to the different uses they are intended for. The common waggon consists of the shafts or rods, being the two pieces which the hind horse bears up; the welds; the flotes, or cross pieces, which hold the shafts together; the bolster, being that part on which the forewheels and the axle-tree turn in wheeling the waggon across the road; the chest or body of the waggon, having the flaves or rails fixed thereon; the bales, or hoops which compose the top; the tilt, the place covered with cloth, at the end of the waggon. See MECHANICS.

WAGTAIL, in ornithology. See MOTACILLA.

WAIFS, BONA WAVIATA, are goods stolen, and waived or thrown away by the thief in his flight, for fear of being apprehended. These are given to the king by the law, as a punishment upon the owner for not himself pursuing the felon, and taking away his goods from him. And therefore if the party robbed do his diligence immediately to follow and apprehend the thief (which is called *making fresh suit*), or do convict him afterwards, or procure evidence to convict him, he shall have his goods again. Waived goods do also not belong to the king till seized by somebody for his use; for if the party robbed can seize them first, though at the distance of twenty years, the king shall never have them. If the goods are hid by the thief, or left any-where by him, so that he had them not about him when he fled; and therefore did not throw them away in his flight; these also are not *bona waviata*, but the owner may have them again when he pleases. The goods of a foreign merchant, though stolen and thrown away in flight, shall never be waifs: the reason whereof may be, not only for the encouragement of trade, but also because there is no wilful default in the foreign merchant's not pursuing the thief, he being generally a stranger to our laws, our usages, and our language.

WAIGATS STRAITS, situated between Nova Zembla and Russia, through which the Dutch failed to the north, as high as 75°, in order to discover a north-east passage to China and the East Indies.

WAINSCOT, in building, the timber-work that serves to line the walls of a room, being usually made in pannels, and painted, to serve instead of hangings.

WAIVE, in law, a woman that is put out of the protection of the law. She is called *waive*, as being forsaken of the law; and not *outlaw* as a man is; by reason women cannot be of the decenna, and are not sworn in leets to the king, nor to

the law, as men are; who are therefore within the law; whereas women are not, and so cannot be outlawed, since they were never within it.

WAKE, the print or track impressed by the course of a ship on the surface of the water. It is formed by the remotion of the body of water which was separated by the ship's bottom whilst moving through it; and may be seen to a considerable distance behind the stern, as smoother than the rest of the sea. Hence it is usually observed by the compass, to discover the angle of lee-way. A ship is said to be in the wake of another when she follows her on the same track, or a line supposed to be formed on the continuation of her keel. Two distant objects observed at sea are called in the wake of each other, when the view of the farthest is intercepted by the nearest; so that the observer's eye and the two objects are all placed upon the same right line.

WAKE is the eve-feast of the dedication of churches, which is kept with feasting and rural diversions. The learned Mr. Whitaker, in his History of Manchester, hath given a particular account of the origin of wakes and fairs. He observes, that every church at its consecration received the name of some particular saint: this custom was practised among the Roman Britons, and continued among the Saxons; and in the council of Cealchythe, in 816, the name of the denominating saint was expressly required to be inscribed on the altars, and also on the walls of the church, or on a tablet within it. The feast of this saint became of course the festival of the church. Thus Christian festivals were substituted in the room of the idolatrous anniversaries of heathenism: accordingly, at the first introduction of Christianity among the Jutes of Kent, Pope Gregory the Great advised what had been previously done among the Britons, viz. Christian festivals to be instituted in the room of the idolatrous, and the suffering day of the martyr whose relics were reposed in the church, or the day on which the building was actually dedicated, to be the established feast of the parish. Both were appointed and observed; and they were clearly distinguished at first among the Saxons, as appears from the laws of the Confessor, where the *dies dedicationis*, or *dedicatio*, is repeatedly discriminated from the *propria festivitas sancti*, or *celebratio sancti*. They remained equally distinct to the Reformation; the dedication-day in 1536 being ordered for the future to be kept on the first Sunday in October, and the festival of the patron saint to be celebrated no longer. The latter was, by way of pre-eminence, denominated the *church's holiday*, or its peculiar festival; and while this remains in many parishes at present, the other is so utterly annihilated in all, that Bishop Kennet (says Mr. Whitaker) knew nothing of its distinct existence, and has attributed to the day of dedication what is true only concerning the saint's day. Thus instituted at first, the day of the tutelar saint was observed, most probably by the Britons, and certainly by the Saxons, with great devotion. And the evening before every saint's day, in the Saxon-Jewish method of reckoning the hours, being an actual hour of the day, and therefore like that appropriated to the duties of public religion, as they reckoned Sunday from the first to commence at the sun-set of Saturday; the evening preceding the church's holiday would be observed with all the devotion of the festival. The people actually repaired to the church, and joined in the services of it; and they thus spent the evening of their greater festivities in the monasteries of the North, as early as the conclusion of the seventh century.

These services were naturally denominated from their late hours *waccan* or *wakes*, and *vigils* or *eves*. That of the anniversary at Rippon, as early as the commencement of the eighth century, is expressly denominated the *vigil*. But that

of the church's holiday was named *cyric waccan*, or church-wake, the church-vigil, or church-eve. And it was this commencement of both with a wake, which has now caused the days to be generally preceded with vigils, and the church-holiday particularly to be denominated the *church-wake*. So religiously was the eve and festival of the patron saint observed for many ages by the Saxons, even as late as the reign of Edgar, the former being spent in the church, and employed in prayer. And the wakes, and all the other holidays in the year, were put upon the same footing with the octaves of Christmas, Easter, and of Pentecost. When Gregory recommended the festival of the patron saint, he advised the people to erect booths of branches about the church on the day of the festival, and to feast and be merry in them with innocence. Accordingly, in every parish, on the returning anniversary of the saint, little pavilions were constructed of boughs, and the people indulged in them to hospitality and mirth. The feasting of the saint's day, however, was soon abused; and even in the body of the church, when the people were assembled for devotion, they began to mind diversions, and to introduce drinking. The growing intemperance gradually stained the service of the vigil, till the severity of it was converted, as it now is, into the rigour of a fast. At length they too justly scandalized the Puritans of the last century, and numbers of the wakes were disused entirely, especially in the east and some western parts of England; but they are commonly observed in the north, and in the midland counties.

This custom of celebrity in the neighbourhood of the church, on the days of particular saints, was introduced into England from the continent, and must have been familiar equally to the Britons and Saxons; being observed among the churches of Asia in the sixth century, and by those of the west of Europe in the seventh. And equally in Asia and Europe on the continent, and in the islands, these celebrities were the causes of those commercial marts which we denominate *fairs*. The people resorted in crowds to the festival, and a considerable provision would be wanted for their entertainment. The prospect of interest invited the little traders of the country to come and offer their wares; and thus, among the many pavilions for hospitality in the neighbourhood of the church, various booths were erected for the sale of different commodities. In large towns, surrounded with populous districts, the resort of the people to the wakes would be great, and the attendance of traders numerous; and this resort and attendance constitute a fair.—Basil expressly mentions the numerous appearance of traders at these festivals in Asia, and Gregory notes the same custom to be common in Europe. And as the festival was observed on a feria or holiday, it naturally assumed to itself, and as naturally communicated to the mart, the appellation of *feria* or fair. Indeed several of our most ancient fairs appear to have been usually held, and have been continued to our time, on the original church-holidays of the places: besides, it is observable, that fairs were generally kept in church-yards, and even in the churches, and also on Sundays, till the indecency and scandal were so great as to need reformation.

Wake-ROBIN. See ARUM.

WALACHIA, a province of Turkey in Europe, bounded on the north by Moldavia and Transylvania, on the east and south by the river Danube, and on the west by Transylvania. It is 225 miles in length, and 125 in breadth; and was ceded to the Turks by the treaty of Belgrade, in 1739. It abounds in good horses and cattle; and there are mines of several kinds. The soil is so fertile, that it is capable of producing any thing; and there are good pastures, with

wine, oil, and all manner of European fruits. The inhabitants are chiefly of the Greek church.

WALCHEREN, an island of the Low-countries, and one of the principal of those of Zealand; separated from Dutch Flanders by the mouth of the Scheldt. It is about nine miles in length, and eight in breadth; and though it lies low, has good arable and pasture land. The chief town of this island and the whole province is Middelburg.

WALDEN, a town of Essex, commonly called *Suffron Walden*, with a market on Saturdays, and two fairs on Midlent Saturday for horses, and November 1st for cows. It is remarkable for the plenty of fassion that grows about it. This town was incorporated by Edward VI. and is governed by a mayor and 24 aldermen. It is 27 miles north-west by north of Chelmsford, and 43 north-east of London, E. Long. o. 20. N. Lat. 52. 4.

WALDENSES. See **WALDO**.

WALDO, a merchant of Lyons in the latter part of the 12th century, who applying himself to the study of the Scriptures, and finding no warrant there for several of the Romish doctrines, particularly that of transubstantiation, publicly opposed them. His followers, who from him were called *Waldenses*, being chased from Lyons, spread over Dauphine and Provence; upon which Philip II. is said to have razed 300 gentlemen's seats, and destroyed several walled towns, to stop their growth: but this, instead of suppressing, spread them over a great part of Europe. The articles of their faith, which they drew up and dedicated to the king of France, agreed in most points with those of the present Protestants. In the year 1200, those of them who dwelt in the province of Albigeois in Languedoc, from whence they were called *Albigenses*, stood upon their defence; upon which Philip drove them into Bohemia, Savoy, and England. The crusade against them is said to have consisted of 500,000 men, who wore their crosses on their breasts, to distinguish themselves from those who went to the Holy Land, and wore them on their shoulders.

WALES (*Principality of*), a country constituting a part of Great Britain: is bounded on the north and west by the Irish Sea, on the east by the English counties of Chester, Salop, Hereford, and Monmouth, and on the south by the river Severn and the Bristol Channel; about 150 miles from north to south, and from 50 to 80 in breadth from east to west. The country is mountainous, but not barren, producing all the necessaries of life; the air is good, the cattle and sheep are numerous, but small: in the mountains are found ores of various metals, freestone, limestone, and coal. It is divided into North and South Wales, each containing six counties. To North Wales belong Anglesea, the counties of Caernarvon, Denbigh, Flint, Merioneth, and Montgomery. In South Wales are the counties of Brecknock, Caermarthen, Cardigan, Glamorgan, Pembroke, and Radnor. The county of Monmouth, which formerly belonged to Wales, was detached from the principality, and annexed to England, in the reign of Henry VIII. The present inhabitants are descendants from the ancient Britons, who were driven out of England by the Saxons, and they have preserved their ancient language; and, in many instances, the manners of their ancestors. Previous to the arrival of the Britons, Wales was inhabited by people named Demetes, Ordovices, and Silures. The Britons, indignant of the Saxon yoke, found an asylum among the mountains of Wales, and forming themselves into different states, were long governed by independent kings, till in the reign of Edward I. The last prince, Llewelin, being vanquished and slain in the year 1283, it was united to England: the Welch, though unable to resist the superior force of Edward, submitted to the English dominion with extreme reluctance; and it

was not till some ages elapsed, that the animosity which had long subsisted between the two nations was totally extinguished. To accelerate that period, and render the conquest more secure, Edward had recourse to acts of barbarous, but not ineffectual policy. Sensible that nothing contributed to keep alive the enthusiasm for national honour so much as the bards of the country, whose employment it was to rehearse at all festivals the glorious deeds of their ancestors, Edward ordered them to be put to death. A subsequent expedient practised by him for the purpose of reconciling the Welch to his government, was of a nature far more conciliating. It is said, that, assembling the natives of the country, he promised to give them for their prince a Welchman by birth, and one who could speak no other language. This popular address being received with acclamations of joy, he invested in the principality his second son, Edward, then an infant, who had been born at Caernarvon. The death of his eldest son, Alphonso, happening soon after, young Edward also became heir of the English monarchy, and united both nations under one government. Since that time, the eldest son of the king of England has always been created Prince of Wales.

WALKING LEAF. See **MANTIS Sycifolia**.

WALL, in architecture, the principal part of a building, as serving both to inclose it, and to support the roof, floors, &c.—Walls are distinguished into various kinds, from the matter whereof they consist; as plastered or mud-walls, brick-walls, stone-walls, flint or boulder-walls, and boarded-walls. See **ARCHITECTURE**.

WALLACE (Sir William), a gallant general of the Scots, who endeavoured to rescue his country from the English yoke; but being taken prisoner, he was unjustly tried by the English laws, condemned, and executed as a traitor to Edward I. in 1304.

WALLACHIA. See **WALACHIA**.

WALLER (Edmund), a celebrated English poet, was the son of Robert Waller, esq. of Agmondesham in Buckinghamshire, by Anne, the sister of the great Hamden, who distinguished himself so much in the beginning of the civil wars. He was born in 1605; and his father dying when he was very young, the care of his education fell to his mother, who sent him to Eaton school. He was afterwards sent to King's college in Cambridge, where he must have been very assiduous in his studies, since, at sixteen or seventeen years of age, he was chosen into the last parliament of King James I. and served as burgess for Agmondesham. He began to exercise his poetical talent so early as the year 1623; as appears from his verses "upon the danger his majesty (being prince) escaped in the road of St. Andro's" for there Prince Charles, returning from Spain that year, had like to have been cast away. It was not, however, Mr. Waller's wit, his fine parts, or his poetry, that so much occasioned him to be first publicly known, as his carrying off the daughter and sole heiress of a rich citizen, against a rival whose interest was espoused by the court. It is not known at what time he married his first lady; but he was a widower before he was 25, when he began to have a passion for Sacharissa, which was a fictitious name for the lady Dorothy Sidney, daughter to the earl of Leicester, and afterwards wife to the earl of Sunderland. He was now known at court, cherished by all who had any relish for wit and polite literature; and was one of the famous club of which Lord Falkland, Mr. Chillingworth, and other eminent men, were members. He was returned burgess for Agmondesham in the parliament which met in April 1640. An intermission of parliaments having disgusted the nation, and raised

jealousies against the designs of the court, which would be sure to discover themselves whenever the king came to ask for a supply, Mr. Waller was one of the first who condemned the preceding measures. He showed himself in opposition to the court, and made a speech in the house on this occasion; from which we may gather some notion of his general principles in government; wherein, however, he afterwards proved very variable and inconstant. He opposed the court also in the long parliament which met in November following, and was chosen to impeach Judge Crawley, which he did in a warm and eloquent speech, July 16th, 1641. This speech was so highly applauded, that 20,000 copies of it were sold in one day. In 1642 he was one of the commissioners appointed by the parliament to present their propositions of peace to the king at Oxford. In 1643 he was deeply engaged in a design to reduce the city of London and the Tower to the service of the king; for which he was tried and condemned, together with Mr. Tomkins his brother-in-law, and Mr. Chalouner. The two latter suffered death; but Mr. Waller obtained a reprieve: he was, however, sentenced to suffer a year's imprisonment, and to pay a fine of 10,000l. After this, he became particularly attached to Oliver Cromwell, upon whom he wrote a very handsome panegyric. He also wrote a noble poem on the death of that great man.

At the Restoration, he was treated with great civility by Charles II. who always made him one of the party in his diversions at the duke of Buckingham's and other places. He wrote a panegyric upon his majesty's return; which being thought to fall much short of that he had before written on Oliver Cromwell, the king one day asked him in raillery, "How is it, Waller, that you wrote a better encomium on Cromwell than on me?" "May it please your majesty," answered he, "we poets generally succeed best in fiction." He sat in several parliaments after the Restoration, and continued in the full vigour of his genius to the end of his life, his natural vivacity bearing him up, and making his company agreeable to the last. He died of a dropsy in 1687, and was interred in the church-yard of Beconsfield, where a monument is erected to his memory. Mr. Waller has been honoured as the most elegant and harmonious versifier of his time, and a great refiner of the English language. The best edition of his works, containing poems, speeches, letters, &c. is that published in quarto by Mr. Fenton in 1730.

WALLIS (Dr. John), a celebrated mathematician, was educated at Cambridge; where he became fellow of Queen's College, and continued to till, by his marriage, he vacated his fellowship. In 1646 he received holy orders, and became chaplain to the Lady Vere. While he lived in this family, he cultivated the art of deciphering; and it is said, that the elector of Brandenburg, for whom he explained several letters written in ciphers, sent him a gold chain and medal. In 1643 he published, "Truth tried; or, Animadversions on the Lord Brooke's Treatise, called *The Nature of Truth*, &c." The next year he was chosen one of the scribes or secretaries to the assembly of divines at Westminster. Dr. Peter Turner, Savilian professor of geometry in Oxford, being ejected by the parliament-visitors in 1649, Mr. Wallis was appointed to succeed him in that place. In 1653 he published at Oxford a Grammar of the English Tongue in Latin. In 1655 he entered the lists with Mr. Hobbes; and their controversy lasted a considerable time. In 1657 the Doctor published his *Mathematical Works*. Upon the death of Dr. Langbaine, he was chosen *custos archivum* of the university. After the Restoration he met with great respect, the king himself entertaining a favourable opinion of him on account of some services he had done both to his royal father and himself. He

was therefore confirmed in his places, admitted one of the king's chaplains in ordinary, and appointed one of the divines empowered to review the book of Common-prayer. He complied with the terms of the act of uniformity, and continued a steady conformist till his death. He was one of the first members of the Royal Society, and corresponded with many learned men. In 1657 the curators of the university press at Oxford thought it for the honour of the university to collect the mathematical works of the doctor, which had been printed separately, some in Latin, some in English, and published them all together in the Latin tongue, in 3 vols. folio. He died in 1703. Besides the works above mentioned, he published many others.

WALLOONS, a name for the inhabitants of a considerable part of the Netherlands, viz. Artois, Hainault, Namur, Luxembourg, and part of Flanders and Brabant.

WALNUT-TREE, in botany. See JUGLANS.

WALPOLE (Sir Robert), earl of Orford, was born at Houghton in Norfolk, Sept. 6, 1674, and educated on the foundation at Eton School. Thence he was elected to King's College, Cambridge, and admitted in 1681; but, succeeding to the family estate by the death of his elder brother, he resigned his fellowship. In 1700 he was chosen member of parliament for King's-Lynn, and represented that borough in several succeeding parliaments. In 1705 he was nominated one of the council to Prince George of Denmark, lord high-admiral of England. In 1707, appointed secretary at war; and, in 1709, treasurer of the navy. In 1710, upon the change of the ministry, he was removed from all his posts, and held no place afterwards during the queen's reign. In 1711 he was voted by the House of Commons guilty of an high breach of trust, and notorious corruption in his office of secretary at war; and it was resolved, that he should be committed to the Tower, and expelled the house.

The borough of Lynn re-elected him; and, though the house declared the election void, yet they persisted in the choice. In the well-known debate, relating to Steele for publishing the "Crüis," he greatly distinguished himself in behalf of liberty, and added to the popularity he had before acquired. The schism-bill too soon after gave him a fine opportunity of exerting his eloquence, and of appearing in the character of the champion of civil and religious liberty. On the death of the queen, a revolution of politics took place, and the Whig party prevailed both at court and in the senate. Walpole had before recommended himself to the house of Hanover, by his zeal for its cause, when the Commons considered the fate of the nation with regard to the Protestant succession; and he had now the honour to procure the assent of the house to the new king (which attended the address of condolence and congratulation) "That the Commons would make good all parliamentary funds." It is therefore not to be wondered at, that his promotion soon took place after the king's arrival; and that in a few days he was appointed receiver and paymaster-general of all the guards and garrisons, and of all other the land forces in Great-Britain, paymaster of the Royal Hospital at Chelsea, and likewise a privy-counsellor. On the opening of a new parliament, a committee of secrecy was chosen, to enquire into the conduct of the late ministry, of which Walpole was appointed chairman; and, by his management, articles of impeachment were read against the Earl of Oxford, Lord Bolingbroke, the Duke of Ormond, and the Earl of Strafford. The eminent service he was thought to have done the nation and the crown, by the vigorous prosecution of those ministers, who were deemed the chief instruments of the peace, was soon rewarded by the extraordinary promotions of first commissioner of the treasury, and chancellor and under-treasurer of the exchequer.

In two years' time, a misunderstanding appeared amongst his majesty's servants; and it became evident, that the interest of Secretary Stanhope and his adherents began to outweigh that of the exchequer, and that Walpole's power was visibly on the decline. King George had purchased of the King of Denmark the duchies of Bremen and Verden, which his Danish majesty had gained by conquest from Charles XII. of Sweden. The Swedish hero, enraged to see his dominions publicly set to sale, conceived a resentment against the purchaser, and formed a design to gratify his revenge on the electorate of Hanover. Upon a message sent to the House of Commons by the king, Secretary Stanhope moved for a supply, to enable his majesty to concert such measures with foreign princes and states, as might prevent any change or apprehensions from the designs of Sweden for the future. This occasioned a warm debate, in which it was remarkable that Walpole kept a profound silence. The country party insisted, that such a proceeding was contrary to the act of settlement. They insinuated, that the peace of the empire was only a pretence, but that the security of the new acquisitions was the real object of this unprecedented supply; and they took occasion to observe too, that his majesty's own ministers seemed to be divided. But Walpole thought proper on this juncture to speak in favour of the supply, which was carried by a majority of four voices only. In a day or two, he resigned all his places to the king; and, if the true cause of his defection from the court had been his disapprobation of the measures then pursuing, we must acknowledge his conduct in this instance to have been noble and praise-worthy. But they who consider the intrigues of party, and that he spoke in favour of these measures, will find little room to suppose, that his resignation proceeded from any attachment to liberty, or love of his country. He resigned most probably with a view to be restored with greater plenitude of power: and the number of his friends, who accompanied him in his resignation, prove it to have been a mere factious movement.

On the day of his resignation, he brought in the famous sinking-fund bill: he presented it as a country gentleman; and said, he hoped it would not fare the worse for having two fathers, and that his successor (Mr. Stanhope) would bring it to perfection. His calling himself the father of a project, which hath since been so often employed to other purposes than were at first declared, gave his enemies frequent opportunity for satire and ridicule; and it hath been sarcastically observed, that the father of this fund appeared in a very bad light, when viewed in the capacity of a nurse. In the course of the debates on this bill, a warm contest arose between Walpole and Stanhope: on some severe reflections thrown upon him, the former lost his usual serenity of temper, and replied with great warmth and impetuosity. The acrimony on both sides produced unbecoming expressions, the betraying of private conversation, and the revealing a piece of secret history, viz. "the scandalous practice of selling places and reversions."

In the next session of parliament, Walpole opposed the ministry in every thing; and even Wyndham or Shippen did not exceed him in patriotism. Upon a motion in the house for continuing the army, he made a speech of above an hour long, and displayed the danger of a standing army, in a free country, with all the powers of eloquence. Early in 1720, the rigour of the patriot began to soften, and the complaisance of the courtier to appear; and he was again appointed paymaster of the forces, and several of his friends were found soon after in the list of promotions. No doubt now remained of his entire conversion to court measures; for, before the end of the year, we find him pleading as strongly for the forces re-

quired by the war-office, as he had before declaimed against them, even though at this time the same pretences for keeping them on foot did not exist.

It was not long before he acquired full ministerial power, being appointed first lord-commissioner of the treasury, and chancellor of the exchequer: and, when the king went abroad in 1723, he was nominated one of the lords-justices for the administration of government, and was sworn sole secretary of state. About this time, he received another distinguished mark of the royal favour; his eldest son, then on his travels, being created a peer, by the title of Baron Walpole, of Walpole. In 1725 he was made knight of the bath; and, the year after, knight of the garter. The measures of his administration, during the long time he remained prime or rather sole minister, have been often canvassed with all the severity of critical inquiry. It is difficult to discern the truth through the exaggerations and misrepresentations of party; and we shall leave it to the impartial historian to set it in a proper light. Though he had been called "The Father of Corruption" (which, however, he was not, but certainly a great improver of it), and is said to have boasted that he knew every man's price; yet, in 1742, the opposition prevailed, and he was not any longer able to carry a majority in the House of Commons. He now resigned all his places, and fled for shelter behind the throne. But there is so little appearance of his credit receiving any diminution, that he was soon after created Earl of Orford, and most of his friends and dependents continued in their places. The king too granted him a pension of 4000*l.* in consideration of his long and faithful services. He died in 1745, aged seventy-one.

About the end of Queen Anne's reign, and the beginning of George the First, he wrote the following pamphlets: 1. "The Sovereign's Answer to the Gloucestershire Address." The sovereign meant Charles duke of Somerset, so nicknamed by the Whigs. 2. "Answer to the Representation of the House of Lords on the State of the Navy, 1709." 3. "The Debts of the Nation stated and considered, in four Papers, 1710." 4. "The Thirty-Five Millions accounted for, 1710." 5. "A Letter from a foreign Minister in England to Monsieur Pettecum, 1710." 6. "Four Letters to a Friend in Scotland upon Sacheverell's Trial;" falsely attributed in the General Dictionary to Mr. Maynwaring. 7. "A short History of the Parliament." 8. "The South-Sea Scheme considered." 9. "A Pamphlet against the Peerage-Bill, 1719." 10. "The Report of the Secret Committee, June 9, 1715."

WALRUS, in zoology. See TRICHECHUS.

WALSH (William), an English critic and poet, the son of Joseph Walsh, esq. of Abberley in Worcestershire, was born about the year 1660. He became a gentleman-commoner of Wadham College, Oxford, but left the university without taking a degree. His writings are printed among the works of the Minor Poets, printed in 1749. He was made gentleman of the horse in Queen Anne's reign; and died in 1708. He was the friend of Mr. Dryden and of Mr. Pope; the former of whom esteemed him the best critic then living; and Mr. Pope has celebrated his character in the Essay on Criticism.

WALSINGHAM, a town of Norfolk, with a market on Fridays, and a fair on Whit-Monday, for horses and pedlar's ware. It is seated not far from the sea; and in former times was famous for its college of canons, and was greatly frequented by pilgrims who went to pay their devotions to the image of the Virgin Mary at the chapel, where there are two fine springs, called the *Virgin Mary's wells*. Not many years ago there were found here 100 urns full of ashes by a husbandman, which were supposed to be those which the Ro-

mans filled with the ashes of the dead. It is 22 miles north-west of Norwich, and 117 north-north-east of London. E. Lon. $\circ$. 53. N. Lat. 52. 56.

WALSINGHAM (Thomas), an English Benedictine monk of the monastery of St. Alban's, about the year 1440. He applied himself to the history and antiquity of his country, in quality of historiographer to the king; and composed the History of King Henry VI. with other works.

WALSINGHAM (Sir Francis), minister and secretary of state during the reign of Queen Elizabeth, and one of the greatest politicians of his time, was descended from a noble and ancient family at Chillehurst. After having made great progress in his studies at Cambridge, he was twice sent ambassador to France, and at his return to England was employed in the most important affairs; became secretary of state, and was one of the commissioners for the trial of Mary queen of Scotland. Sir Francis was undoubtedly one of the most refined politicians and most penetrating statesmen that any age ever produced. He had an admirable talent, both in discovering and managing the secret recesses of the heart. He had his spies in most courts in Christendom, and allowed them a liberal maintenance; for it was his maxim, That knowledge cannot be bought too dear. In 1587 the king of Spain having made vast preparations, which surprized, and kept all Europe in suspense, Walsingham employed his utmost endeavours for the discovery of that important secret; and accordingly procured intelligence from Madrid, that the king had informed his council of his having dispatched an express to Rome, with a letter written with his own hand to the pope, acquainting him with the true design of his preparations, and begging his blessings upon him; which for some reasons he could not disclose till the return of the courier. The secret being thus lodged with the pope, Walsingham, by means of a Venetian priest, whom he retained at Rome as a spy, got a copy of the original letter, which was stolen out of the pope's cabinet by a gentleman of the bed-chamber, who took the key out of the pope's pocket while he slept. After this, by his dexterous management, he caused the Spaniards' bills to be protected at Genoa, which should have supplied them with money for their extraordinary preparations; and by this means he happily retarded this formidable invasion for a whole year. In short, he spent his whole time and faculties in the service of Queen Elizabeth; on which account her majesty was heard to say, "That in diligence and fidelity he exceeded her expectations." However, after all his eminent services to his country, this great man gave a remarkable proof at his death, which happened on the 6th of April, 1590, how far he preferred the public interest to his own, he being so poor, that, excepting his library, which was a very fine one, he had scarcely effects enough to defray the expense of his funeral. His principal works are, 1. *Memoirs and Instructions for the use of Ambassadors*, with his *Letters and Negotiations*. 2. *Political Memoirs*.

WALTHERIA, in botany: a genus of plants in the class *monodelpha*, and order *triandra*; and in the natural system arranged under the 37th order, *Columjifera*. There is only one pistillum, and the capsule is unilocular, bivalved, and monopermuous. There are three species, none of which are natives of Britain.

WALTON (Bryan), bishop of Chester, a learned English divine, who gained great reputation by his edition of the Polyglot Bible, with his *Prolegomena* in the beginning; which is more exact, says Father Simon, than any other which had been published on that subject. He died in 1661.

WAMPUM, the money used by the North-American In-

dians. It is much used in all their treaties as a symbol of friendship. It is made of a shell of a particular species of *Venus*.

WAPENTAKE, is the same with what we call a *hundred*; especially used in the north countries beyond the river Trent. The word seems to be of Danish original, and to be so called for this reason: when first this kingdom, or part thereof, was divided into wapentakes, he who was the chief of the wapentake or hundred, and whom we now call a *high constable*, as soon as he entered upon his office, appeared in a field on a certain day on horseback with a pike in his hand, and all the chief men of the hundred met him there with their lances, and touched his pike; which was a sign that they were firmly united to each other by the touching their weapons. But Sir Thomas Smith says, that anciently musters were made of the armour and weapons of the several inhabitants of every wapentake; and from thence that could not find sufficient pledges for their good abearing, their weapons were taken away and given to others; from whence he derives the word.

WAR, a great evil; but inevitable, and oftentimes necessary. If he who first reduced to rules the art of destroying his fellow-creatures, had no end in view but to gratify the passions of princes, he was a monster, whom it would have been a duty to smother at his birth: but if his intention was the defence of persecuted virtue, or the punishment of successful wickedness, to curb ambition, or to oppose the unjust claims of superior power, mankind ought to erect altars to his memory.

War, in the last case, is the most necessary and useful of all the sciences: the various kinds of knowledge which ought to furnish the mind of a soldier are not without great difficulty to be attained. Of most other sciences the principles are fixed, or at least they may be ascertained by the assistance of experience; there needs nothing but diligence to learn them, or a particular turn of mind to practise them. Philosophy, mathematics, architecture, and many others, are all founded upon invariable combinations. Every man, even of a narrow understanding, may remember rules, apply them properly, and sometimes draw just consequences from them: but the science of war branches out into so many particulars; it takes in so many different parts; there are so many reflections necessary to be made, so many circumstances and cases to be brought together; that it is only by a continual application, grounded upon the love of his duty, and an inclination to his profession, that any man can attain it.

To march an army in every fort of country, whether open, woody, or mountainous; to know how to form a camp in all those countries, with which the general must be thoroughly acquainted in order to do it with security; to make a proper disposition for a battle, whether with a view to the posture of the enemy, or to the situation of the country; to foresee events which depend in a manner upon chance; to be capable of making a good retreat on proper occasions; to direct the forages without fatiguing or exposing the troops; to send out detachments with precaution; to conduct the convoys in safety; to know how to canton an army; to establish magazines in places, both safe and within reach of the army, so that it shall never be in want of subsistence;—these are the great ends of the military science.

It is commonly thought sufficient for a military man to know how to obey; and it is also supposed that the success of a day cannot be dubious, if a general joins the confidence of the soldiers to personal courage, a cool head, and a knowledge of the country.

It is true that, in cases of perplexity, many generals have in a great measure owed to their own capacity, and the confi-

dence their soldiers have reposed in them, the advantages they have gained over the enemy; and confidence will always be reposed by the soldiers in that general in whom they perceive coolness united with courage. At the battle of Cannæ, when Gisco seemed to be much astonished at the superiority of the enemy's number, Hannibal answered him coolly, "There is, Gisco, a thing still more surprising, of which you take no notice." Gisco asking him what it was, "It is (replied Hannibal) that in all that great crowd there is not one man whose name is *Gisco*." Plutarch observes, that this coolness of Hannibal greatly animated the Carthaginians, who could not imagine that their general would joke at so important a time, without being certain of overcoming his enemies.

Although bravery and courage are the most essential qualifications of a subordinate officer, yet he should not be deficient in those which are required in a general, and which have been already mentioned; obedience to the orders delivered to him is no longer a virtue than whilst he comprehends and knows the intention of them. War, says a celebrated author, is a business which, like all others, must be learned; it supposes some qualities to be born with us, and demands others which are to be acquired; but since all these qualities must have the original source in genius, a man who proposes war for his profession, should never engage in it without having consulted his natural bent, or without knowing the particular turn and power of his mind. Ability, whether in a general or an officer, is the effect of his genius, quickened by a natural liking to his business.

A quick eye, which is of great importance to a soldier, is natural to some, and in them it is the effect of genius; others acquire it by study or experience; he who knows how to command himself, and has courage enough to keep himself cool on the most urgent occasions, has the readiest and quickest eye. A quick, hot-headed man, however brave, sees nothing; or if he does, it is confusedly, and generally too late.

It is this quick eye which enables a general to judge of an advantageous post, of a manœuvre to be made, and of a good disposition for the troops, whether with respect to that of the enemy, or to the situation and nature of the country.

The quick eye is no other than that penetrating genius which lets nothing escape it. A general who knows how to unite this quality with perpetual coolness, never is in want of expedients; he will see how those events, which to any other would be the preface of his own defeat, may end in the overthrow of his enemies.

The choice of the general officers depends upon this genius, which discovers every thing; they ought to be the right hand of the general, and as capable of commanding the army as himself. Whatever good dispositions a general may make, they must prove ineffectual if not seconded by the general officers under his command; he cannot be every-where, neither can he foresee all exigencies that may arise. He is obliged to give only general orders; it is therefore the business of those who command under him to know how to take the advantage of a wrong movement of the enemy; to take upon them to attack, or sustain the troops which are engaged; and, as circumstances vary, to make them advance towards the enemy, either to keep him back or to attack him.

But the qualities already mentioned would be useless, if order and discipline were not severely observed: the most numerous and best composed army would soon become little else than a body of rangers, who being only united by the hope of booty, would separate as soon as that motive ceased; and trusting each to his own head, or indulging his own humour, would be cut in pieces party by party: so that if the general does not keep up subordination (the soul and strength of discipline), his

army will be nothing more than a troop of Tartars acting more from the hope of plunder than the desire of glory. What art and what genius is there not requisite to maintain this subordination? Too much severity disgraces the soldier, and renders him mutinous; too much indulgence sinks him into indolence, and makes him neglect his duty; licentiousness causes that subordination to seem burdensome, which should never in any degree be given up; he loses that respect, and often that confidence, which he should have with regard to his officer; and indulgence often makes a well-disciplined body become a set of sluggards, who march against their will, and who, on the most pressing emergencies, think only on their own safety.

Besides these qualities, which are essential to a general, and which all who would attain that rank ought of course to have, there are still many others necessary to make a great man. A general who would merit the title of a hero, ought to unite in himself, all civil, military, and political excellence. It is by this that he will easily attain to make war with success: nothing will escape him; he will know without difficulty the genius of every country, and of the nations which compose the enemy's army, the abilities of the generals who command, and the nature of the troops under them; he knows that he may venture a motion with some troops that he would not dare to attempt with others that are equally brave. One nation is vehement, fiery, and formidable in the first onset; another is not so hasty, but of more perseverance: with the former, a single instant determines success; with the latter, the action is not so rapid, but the event is less doubtful.

No man is born a general, although he brings into the world with him the seeds of those virtues which makes a great man: Cæsar, Spinala, Turenne, the great Condé, and some others, showed, even in their earliest years, such qualities as ranked them above other men; they carried within them the principles of those great virtues which they drew forth to action by profound study, and which they brought to perfection by the help of practice: those who came after them, with perhaps fewer natural talents, have by study rendered themselves worthy of being compared to them. Cæsar and all conquerors had this advantage, that they were able to make their own opportunities, and always acted by their own choice. A man may be a good general without being a Marlborough or a Turenne: such geniuses are scarcely seen once in an age; but the more they are raised above the rest of mankind, the more they ought to excite emulation. It is by endeavouring to surpass the intellects of the second rate; it is by striving to equal the most sublime, that the imitation of them is to be attained. This passion in a soldier is neither pride nor presumption; it is virtue; and it is by this only that he can hope to be servicable to the state, and add to the glory of his king and country.

How much soever the honour of commanding armies may be sought after, it degrades him who is not worthy of it; this rank, so much desired, borders on the two extremes of glory and ignominy. A military man who labours to make himself capable of commanding, is not to be blamed; his ambition is noble: by studying the art of commanding, he learns that of obeying and of executing. But it is astonishing in the highest degree to see soldiers thinking only on preferment, and neglecting the study of their business. It is perhaps less surprising if we see others, without having been tried, proposing to themselves to command in chief; because such attempts suppose in the projector an absurd temerity, founded on a profound ignorance of the talents he ought to have, and the virtues which he has not. Such boldness is the character of a man whose mind is too narrow to perceive his

danger: we should rather approve the timidity that suffers itself to be defeated by terror, since it shows at least that he knows to what hazards he is exposed; both one and the other are blameable: modesty is the only proper quality of a soldier; it gives splendour to virtue, it argues diffidence of himself, and desire of arriving at perfection.

The title of general would be less tempting, if proper attention was paid to the qualities it requires, and the duties it imposes; it would then appear a very honourable, but painful burden. The most firm and intrepid genius might be discouraged, merely by thinking that on the conduct of a general depends the fate of the state, the glory of his prince's arms, and his own reputation.

Our predecessors have gone to a considerable length in detailing all that is necessary to be known in the art of war; but in this we shall not imitate them; not merely because our limits do not allow of that extension which the subject would require to be treated to any good purpose, but because the utility of such an article would be extremely limited.

Man-of-War Bird. See PELICANUS.

War-Cry was formerly customary in the armies of most nations, when just upon the point of engaging. Sometimes they were only unumbruous shouts, or horrid yells, uttered with an intent to strike terror into their adversaries; such as is now used by the Indians in America, called the *war-whoop*.

WARBLES, in farriery. See FARRIERY.

WARBURTON (William), an English prelate of gigantic abilities, was born at Newark-upon-Trent, in the county of Nottingham, Dec. 24, 1698. His father was George Warburton, an attorney, and town-clerk of the place in which this his eldest son received his birth and education. His mother was Elizabeth, the daughter of William Hobman, an alderman of the same town, and his parents were married about the year 1666. The family of Dr. Warburton came originally from the county of Chester, where his great grandfather resided. His grandfather, William Warburton, was the first that settled at Newark; where he practised the law, and was coroner of the county of Nottingham. George Warburton, the father, died about the year 1706, leaving his widow and four children, two sons and two daughters, of which the second son George died young; but of the daughters one survived her brother. The bishop received the early part of his education under Mr. Weston, then master of Okeham school in Rutlandshire, and afterwards vicar of Campden in Gloucestershire; in which he was succeeded by his son, both from the gift of the earl of Gainborough. His original designation was to the same profession as that of his father and grandfather, and he was accordingly placed clerk to an attorney, with whom he remained until he was qualified to engage in business upon his own account. He was then admitted to one of the courts at Westminster, and for some years continued the employment of an attorney and solicitor at the place of his birth. The success he met with as a man of business was probably not great. It was certainly insufficient to induce him to devote the rest of his life to it: and it is probable, that his want of encouragement might tempt him to turn his thoughts towards a profession in which his literary acquisitions would be more valuable, and in which he might more easily pursue the bent of his inclination. He appears to have brought from school more learning than was requisite for a practising lawyer. This might rather impede than forward his progress, as it has been generally observed, that an attention to literary concerns, and the bustle of an attorney's office, with only a moderate share of business, are

wholly incompatible. It is therefore no wonder that he preferred retirement to noise, and relinquished what advantages he might expect from continuing to follow the law. It has been suggested by an ingenious writer, that he was for some time usher to a school. In 1724 his first work appeared, under the title of "Miscellaneous Translations in Prose and Verse, from Roman Poets, Orators, and Historians." 12mo. It is dedicated to his early patron, Sir Robert Sutton, and seems to have laid the foundation of his first ecclesiastical preferment. At this period it is probable he had not abandoned his profession, though it is certain he did not attend to it much longer. About Christmas 1726, he came to London, and while there was introduced to Theobald, Concanen, and others of Mr. Pope's enemies, with whose conversation he was extremely pleased. It was at this time that he wrote a letter to Concanen, dated Jan. 2, 1726, which, by accident, falling into the hands of the late Dr. Akenfide, was produced to most of that gentleman's friends, and by that means became the subject of much speculation. About this time he also communicated to Theobald some notes of Shakspeare, which afterwards appeared in that critic's edition of our great dramatic poet. In 1727 his second work, entitled, "A Critical and Philosophical Inquiry into the Causes of Prodiges and Miracles, as related by Historians," &c. was published in 12mo, and was also dedicated to Sir Robert Sutton. He was at this time in orders; and on the 25th of April, 1728, had the honour to be in the king's list of Masters of Arts, created at Cambridge, on his majesty's visit to that university. In June, the same year, he was preferred by Sir Robert Sutton to the rectory of Burnt Broughton, in the diocese of Lincoln; a living worth 200l. a-year, which he retained till his death, at which he spent a considerable part of his middle-life in a studious retirement, devoted entirely to letters, and there planned, and in part executed, some of his most important works. Several years elapsed, after obtaining this preferment, before Mr. Warburton appeared again in the world as a writer. In 1736 he exhibited a plan of a new edition of Velleius Paterculus, which he printed in the "Bibliothèque Britannique, ou Histoire des Ouvrages des Savans de la Grande Bretagne, pour les Mois Juillet, Août, & Sept. 1736. A la Haye." The design never was completed. It was in this year that he may be said to have emerged from the obscurity of a private life into the notice of the world. The first publication which rendered him afterwards famous now appeared, under the title of "The Alliance between Church and State; or, the Necessity and Equity of an established Religion and a Test Law, demonstrated from the Essence and End of Civil Society, upon the fundamental Principles of the Law of Nature and Nations." In three parts: the first, treating of a civil and religious society; the second, of an established church; and the third, of a test law, 8vo. At the end was announced the scheme of "The Divine Legation of Moses," in which he had at this time made a considerable progress. The first volume of this work was published in January 1737-8, and met with a reception which neither the subject, nor the manner in which it was treated, seemed to authorize. It was, as the author afterwards observed, fallen upon in so outrageous and brutal a manner, as had been scarcely pardonable, had it been "The Divine Legation of Mahomet." — It produced several answers, and so much abuse from the authors of "The Weekly Miscellany," that in less than two months he was constrained to defend himself, in "A Vindication of the Author of the Divine Legation of Moses, from the Aspersions of the Country Clergyman's Letter in the Weekly Miscellany of February 14, 1737-8." 8vo. Mr. Warburton's extraordinary merit had now attracted the

notice of the heir apparent to the crown, in whose immediate service we find him, in June 1738, when he published "Faith working by Charity to Christian Edification: a Sermon, &c." The "Essay on Man" had been now published some years; and it is universally supposed that the author had, in the composition of it, adopted the philosophy of lord Bolingbroke, whom on this occasion he had followed as his guide, without understanding the tendency of his principles. In 1738 M. de Crousaz wrote some remarks on it, accusing the author of spinosifm and naturalism: which falling into Mr. Warburton's hands, he published a defence of the first epistle, and soon after of the remaining three, in seven letters, of which six were printed in 1739, and the seventh in June 1740, under the title of "A Vindication of Mr. Pope's Essay on Man, by the Author of the Divine Legation." The opinion which Mr. Pope conceived of these defences, as well as of their author, will be best seen in his letters. In consequence, a firm friendship was established between them, which continued with undiminished fervour until the death of Mr. Pope, who, during the remainder of his life, paid a deference and respect to his friend's judgment and abilities, which will be considered by many as almost bordering on servility. In 1741 the second volume of "The Divine Legation," in two parts, containing books IV. V. VI. was published: as was also a second edition of the "Alliance between Church and State." In the summer of that year, Mr. Pope and Mr. Warburton, in a country ramble, took Oxford in their way, where they parted; Mr. Pope, after one day's stay, going westward; and Mr. Warburton, who stayed a day after him to visit Dr. Conybeare, then dean of Christ-church, returning to London. On that day the vice-chancellor, Dr. Leigh, sent a message to his lodgings, with the usual compliment, to know if a doctor's degree in divinity would be acceptable to him; to which such an answer was returned as to civil a message deserved. About the same time, Mr. Pope had the like offer made him of a doctor's degree in law, which he seemed disposed to accept, until he learnt that some impediment had been thrown in the way of his friend's receiving the compliment intended for him by the vice-chancellor. He then absolutely refused that propoal to himself. Both the degrees were therefore laid aside; and the university of Oxford lost some reputation by the conduct of this business, being thus deprived of the honour of two names, which certainly would have reflected much credit on the society in which they were to have been enrolled. Mr. Pope's affection for Mr. Warburton was of service to him in more respects than merely increasing his fame. He introduced and warmly recommended him to most of his friends, and among the rest to Ralph Allen, esq. of Prior-Park, whose niece he some years afterwards married, and whose great fortune at length came to his only son. In consequence of this introduction, we find Mr. Warburton at Bath in 1742. There he printed a sermon, which had been preached at the Abbey-church, on the 24th of October, for the benefit of Mr. Allen's favourite charity, the General-hospital, or Infirmary. To this sermon, which was published at the request of the governor, was added, "A short Account of the Nature, Rise, and Progress, of the General-Infirmary at Bath." In this year also, he printed a dissertation on the origin of books of chivalry, at the end of Jarvis's preface to a translation of Don Quixote.

In 1742 Mr. Warburton published "A Critical and Philosophical Commentary on Mr. Pope's Essay on Man. In which is contained a Vindication of the said Essay from the Misrepresentations of Mr. de Resnel, the French Translator, and of Mr. de Crousaz, Professor of Philosophy and

Mathematics in the Academy of Lausanne, the Commentator." It was at this period, when Mr. Warburton had the entire confidence of Mr. Pope, that he advised him to complete the *Dunciad*, by changing the hero and adding to it a fourth book. This was accordingly executed in 1742, and published early in 1743, in 4to. with notes by our author, who, in consequence of it, received his share of the satire which Mr. Cibber liberally bestowed on both Mr. Pope and his annotator. In the latter end of the same year, he published complete editions of "The Essay on Man," and "The Essay on Criticism;" and from the specimen which he there exhibited of his abilities, it may be presumed, Mr. Pope determined to commit the publication of those works which he should leave to Mr. Warburton's care. At Mr. Pope's desire, he about this time revised and corrected the "Essay on Homer," as it now stands in the last edition of that translation. The publication of "The *Dunciad*," was the last service which our author rendered Mr. Pope in his life-time. After a lingering and tedious illness, the event of which had been long foreseen, this great poet died on the 30th of May, 1744; and by his will, dated the 12th of the preceding December, bequeathed to Mr. Warburton one half of his library, and the property of all such of his works already printed as he had not otherwise disposed of or alienated, and all the profits which should arise from any edition to be printed after his death; but at the same time directed, that they should be published without any future alterations. In 1744, his assistance to Dr. Z. Grey was handsomely acknowledged in the preface to *Hudibras*. "The Divine Legation of Moses," had now been published some time, and various answers and objections to it had started up from different quarters. In this year, 1744, Mr. Warburton turned his attention to these attacks on his favourite work: and defended himself in a manner which, if it did not prove him to be possessed of much humility or diffidence, at least demonstrated, that he knew how to wield the weapons of controversy with the hand of a master. Sep. 5, 1745, the friendship between him and Mr. Allen was more closely cemented, by his marriage with Miss Tucker, who survived him, and became afterwards the wife of the Rev. Mr. Smith. At this juncture the kingdom was under a great alarm, occasioned by the rebellion breaking out in Scotland. Those who wished well to the then established government, found it necessary to exert every effort which could be used against the invading enemy. The clergy were not wanting on their part; and no one did more service than Mr. Warburton, who printed three very excellent and seasonable sermons at this important crisis. The last of these involved him in a new controversy with Dr. Seebing. Notwithstanding his great connections, his acknowledged abilities, and his established reputation; a reputation founded on the durable basis of learning, and upheld by the decent and attentive performance of every duty incident to his station; yet we do not find that he received any addition to the preferment given him in 1728, by Sir Robert Sutton (except the chaplainship to the Prince of Wales) until April 1746, when he was unanimously called by the Society of Lincoln's-Inn to be their preacher. In November he published "A Sermon preached on the Thanksgiving appointed to be observed the 9th of October, for the Suppression of the late unnatural Rebellion, 1746," in 8vo. In 1747 appeared his edition of "Shakspeare, and his 'Preface to *Clarissa*,'" and, in the same year he published, 1. "A Letter from an Author to a Member of Parliament, concerning Literary Property," in 8vo. 2. "Preface to Mrs. Cockburn's Remarks upon the Principles and Reasonings of Dr. Rutherford's Essay on the Nature and Obligations of Virtue, &c." in 8vo. 3. Pre-

face to a Critical Inquiry into the Opinions and Practice of the Ancient Philosophers, concerning the Nature of a Future State, and their Method of teaching by double Doctrine," (by Mr. Towne), 1747, in 8vo. 2d edition. In 1748, a third edition of "The Alliance between Church and State; corrected and enlarged." In 1749, a very extraordinary attack was made on the moral character of Mr. Pope, from a quarter whence it could be the least expected. "His guide, philosopher, and friend," Lord Bolingbroke, published a book which he had formerly lent Mr. Pope in MS. The preface to this work, written by Mr. Mallet, contained an accusation of Mr. Pope's having clandestinely printed an edition of his lordship's performance without his leave or knowledge. A defence of the poet soon after made its appearance, which was universally ascribed to Mr. Warburton, and was afterwards owned by him: it soon afterwards produced an abusive pamphlet. About this time, the publication of Dr. Middleton's "Inquiry concerning the Miraculous Powers," gave rise to a controversy, which was managed with great warmth and asperity on both sides, and not much to the credit of either party. On this occasion, Mr. Warburton published an excellent performance, written with a degree of candour and temper, which, it is to be lamented, he did not always exercise. The title of it was, "Julian; or, a Discourse concerning the Earthquake and fiery Eruption which defeated the Emperor's Attempt to rebuild the Temple at Jerusalem, 1750," in 8vo. In 1751, he gave the public his edition of "Mr. Pope's Works," with notes, in nine vols. 8vo. and in the same year printed "An Answer to a Letter to Dr. Middleton, &c." in 8vo. and "An Account of the Prophecies of Arise Evans, the Welsh Prophet, in the last Century;" the latter of which pieces afterwards subjected him to much ridicule. In 1753, Mr. Warburton published the first volume of a course of sermons preached at Lincoln's-Inn; and this, in the subsequent year, was followed by a second. After the public had been some time promised Lord Bolingbroke's works, they were about this time printed. The known abilities and infidelity of this nobleman had created apprehensions in the minds of many people of the pernicious effects of his doctrines; and nothing but the appearance of his whole force could have convinced his friends, how little there was to be dreaded from arguments against religion so weakly supported. The personal enmity, which had been excited many years before between the peer and our author, had occasioned the former to direct much of his reasoning against two works of the latter. Many answers were soon published, but none with more acuteness, solidity, and sprightliness, than, "A View of Lord Bolingbroke's Philosophy, in two Letters to a Friend, 1754." The third and fourth letters were published in 1755, with another edition of the two former; and, in the same year, a smaller edition of the whole; which, though it came into the world without a name, was universally ascribed to Mr. Warburton, and afterwards publicly owned by him. At this advanced period of his life, that preference which his abilities might have claimed, and which had hitherto been withheld, seemed to be approaching towards him. In Sept. 1754, he was appointed one of his majesty's chaplains in ordinary, and in the next year was presented to a prebend in the cathedral of Durham, on the death of Dr. Mangey. About the same time, the degree of doctor of divinity was conferred on him by Dr. Herring, then archbishop of Canterbury; and a new impression of "The Divine Legation" having been called for, he printed a fourth edition of the first part of it, corrected and enlarged, divided into two volumes, with a dedication to the Earl of Hardwicke. The same year appeared "A Ser-

mon preached before his Grace, Charles, Duke of Marlborough, President, and the Governors of the Hospital for the Small-Pox and for Inoculation, at the Parish-Church of St. Andrew, Holborn, on Thursday, April 24, 1755," in 4to.; and, in 1756, "A Sermon preached on the last public Fast-Day, at Lincoln's-Inn-Chapel," in 4to. In 1757, a pamphlet was published, called, "Remarks on Mr. David Hume's Essay on the Natural History of Religion;" which is said to have been composed of marginal-observations, made by Dr. Warburton on reading Mr. Hume's book; and which gave so much offence to the author, animated upon, that he thought it of importance enough to deserve particular mention in the short account of his life. Oct. 11, in this year, our author was advanced to the deanery of Bristol; and in 1758, republished the second part of "The Divine Legation," divided into two parts. At the latter end of next year, Dr. Warburton received the honour so justly due to his merit, of being (on the 22d of December) dignified with the mitre, and promoted to the vacant see of Gloucester. He was consecrated on the 20th of Jan. 1760; and on the 30th of the same month preached before the House of Lords. In the next year he printed "A rational Account of the Nature and End of the Sacrament of the Lord's Supper," in 12mo. In 1762 he published "The Doctrine of Grace, &c." in 2 vols. 12mo. and in the succeeding year drew upon himself much illiberal abuse from some writers of the popular party, on occasion of his complaint in the House of Lords, Nov. 15, 1763, against Mr. Wilkes, for putting his name to certain notes on the infamous "Essay on Woman." In 1765, another edition of the second part of "The Divine Legation" was published, as volumes III. IV. and V. the two parts printed in 1755 being considered as volumes I. and II. It was this edition which produced the well-known controversy between him and Dr. Lowth. On this occasion was published "The Second Part of an Epistolary Correspondence between the Bishop of Gloucester and the late Professor of Oxford, without an Imprimatur, i. e. without a Cover to the violated Laws of Honour and Society, 1765," in 8vo. In 1766 he gave a new edition of "The Alliance between Church and State," and "A Sermon preached before the Incorporated Society for the Propagation of the Gospel in Foreign Parts; at the Anniversary-Meeting in the Parish-Church of St. Mary-le-Bow, Friday, Feb. 21," in 8vo. The next year produced a third volume of his, "Sermons;" and with this, and a single "Sermon preached at St. Lawrence-Jewry, Thursday, April 30, 1767," before his Royal Highness, Edward, Duke of York, President, and the Governors of the London-Hospital, &c." in 4to. he closed his literary labours. His faculties continued, unimpaired for some time after this period; and in 1769 he gave considerable assistance to Mr. Ruffhead, in his "Life of Mr. Pope." He lost an only son a little before his own death, which was in June 1779, in the 81st year of his age. A neat marble monument has been lately erected in the cathedral of Gloucester, with an inscription.

WARD (Dr. Seth), an English prelate, chiefly famous for his knowledge in mathematics and astronomy, was born at Buntingford in Hertfordshire, about the year 1617. He was admitted of Sidney-college, Cambridge, where he applied with great vigour to his studies, particularly to the mathematics, and was chosen fellow of his college. He was involved not a little in the consequences of the civil war, but soon after the Restoration obtained the bishopric of Exeter; in 1667 he was translated to Salisbury; and in 1671 was made chancellor of the order of the garter; he was the first Protestant bishop that enjoyed that honour, and he procured it to be annexed to the see of Salisbury. Bishop

Ward was one of those unhappy persons who have the misfortune to survive their senses, which happened in consequence of a fever ill cured; he lived to the Revolution, without knowing any thing of the matter, and died in 1690. He was the author of several Latin works in mathematics and astronomy, which were thought excellent in their day; but their use has been superseded by later discoveries and the Newtonian philosophy.

WARD (Dr. John), was the son of a dissenting minister, and born at London in 1679. He for some years kept a school in Tenter-alley, Moorfields; but rendered himself prominent in the study of antiquity, that in 1720 he was chosen professor of rhetoric in Gresham-college; in 1723, during the presidency of Sir Isaac Newton, he was elected a fellow of the Royal Society; and in 1752, one of the vice-presidents, in which office he was continued to his death. He was elected one of the trustees of the British Museum in 1753, and died at Gresham-college in 1758. The work for which he is best known, is his *Lives of the Professors of Gresham-college*; which is a considerable addition to the history of learning in our country. His *Lectures on Oratory* were published after his death, in two volumes, 8vo.

WARD, is variously used in our old books: a ward in London is a district or division of the city, committed to the special charge of one of the aldermen; and in London there are twenty-six wards, according to the number of the mayor and aldermen, of which every one has his ward for his proper guard and jurisdiction. A forest is divided into wards; and a prison is called a *ward*. Lastly, the heir of the king's tenant, that held *in capite*, was termed a *ward* during his minority; but this wardship is taken away by the statute 12 Car. II. c. 24.

WARD-HOOK, or *Wadd-hook*, in gunnery, a rod or staff, with an iron end turned ferpentwise, or like a screw, to draw the wadding out of a gun when it is to be unloaded.

WARDEN, or GUARDIAN, one who has the charge or keeping of any person, or thing, by office. Such is the warden of the Fleet, the keeper of the Fleet prison; who has the charge of the prisoners there, especially such as are committed from the court of Chancery for contempt.

WARDHUIS, a port of Norwegian Lapland, 120 miles south-east of the North Cape. E. Long. 31. 12. N. Lat. 70. 23.

WARDMOTE, in London, is a court so called, which is kept in every ward of the city: answering to the *curia comitis* of Rome.

WARDROBE, a closet or little room adjoining to a bed-chamber, serving to dispose and keep a person's apparel in; or for a servant to lodge in, to be at hand to wait, &c. The Wardrobe, in a prince's court, is an apartment wherein his robes, wearing apparel, and other necessaries, are preserved under the care and direction of proper officers.

In Britain, the *Master or Keeper of the Great Wardrobe*, was an officer of great antiquity and dignity. High privileges and immunities were conferred on him by King Henry VI. which were confirmed by his successors; and King James I. not only enlarged them, but ordained that this office should be a corporation or body politic for ever.

It was the duty of this office to provide robes for the coronations, marriages, and funerals, of the royal family; to furnish the court with hangings, cloths of state, carpets, beds, and other necessaries; to furnish houses for ambassadors at their first arrival; cloths of state, and other furniture, for the lord-lieutenant of Ireland, and all his majesty's ambassadors abroad; to provide all robes for foreign knights of the garter; robes for the knights of the garter at home;

robes and all other furniture for the officers of the garter; coats for kings, heralds, and pursuivants at arms; robes for the lords of the treasury, and chancellor of the exchequer, &c. livery for the lord chamberlain, grooms of his majesty's privy chamber, officers of his majesty's robes; for the two chief justices, for all the barons of the exchequer, and several officers of these courts; all liveries for his majesty's servants, as yeomen of the guard, and wardens of the Tower, trumpeters, kettle-drummers, drummers, and fifes; the messengers, and all belonging to the stables, as coachmen, footmen, littermen, postillions, and grooms, &c. all the king's coaches, chariots, harnesses, saddles, bits, bridles, &c. the king's watermen, game-keepers, &c. also furniture for the royal yachts, and all rich embroidered tilts, and other furniture for the barges.

Besides the master or keeper of the wardrobe, who had a salary of 2000l. there was his deputy, who had 150l. and comptroller and a patent clerk, each of whom has a salary of 300l. Besides many other inferior officers and servants, who were all sworn servants to the king.

There was likewise a removing wardrobe-keepers at St. James's, Windsor Castle, Hampton Court, Kensington, and Somerset House; but the whole of the wardrobe establishment was abolished by act of parliament in 1782, and the duty of it in future to be done by the lord-chamberlain.

WARDSHIP, in chivalry, one of the incidents of tenure by knight-service. See *FEOBAL System*, *KNIGHT Service*, and *TENURE*.

Upon the death of a tenant, if the heir was under the age of twenty-one, being a male, or fourteen being a female, the lord was entitled to the wardship of the heir, and was called the *guardian in chivalry*. This wardship consisted in having the custody of the body and lands of such heir, without any account of the profits, till the age of twenty-one in males, and sixteen in females. For the law supposed the heir-male unable to perform knight-service till twenty-one; but as for the female, she was supposed capable at fourteen to marry, and then her husband might perform the service. The lord therefore had no wardship, if at the death of the ancestor the heir-male was of the full age of twenty-one, or the heir-female of fourteen; yet if she was then under fourteen, and the lord once had her in ward, he might keep her so till sixteen, by virtue of the statute of Westminster, 1. 3 Edw. I. c. 22. the two additional years being given by the legislature for no other reason but merely to benefit the lord.

This wardship, so far as it related to land, though it was not nor could be part of the law of feuds, so long as they were arbitrary, temporary, or for life only; yet when they became hereditary, and did consequently often descend upon infants, who by reason of their age could neither perform nor stipulate for the services of the feud, does not seem upon feudal principles to have been unreasonable. For the wardship of the land, or custody of the feud, was retained by the lord, that he might out of the profits thereof provide a fit person to supply the infant's services till he should be of age to perform them himself. And if we consider a feud in its original import, as a stipend, fee, or reward for actual service, it could not be thought hard that the lord should withhold the stipend so long as the service was suspended. Though undoubtedly to our English ancestors, where such stipendary donation was a mere supposition or figment, it carried abundance of hardship; and, accordingly, it was relieved by the charter of Henry I. which took this custody from the lord, and ordained that the custody, both of the land and the children, should belong to the widow or

next of kin. But this noble immunity did not continue many years.

The wardship of the body was a consequence of the wardship of the land; for he who enjoyed the infant's estate was the properest person to educate and maintain him in his infancy: and also in a political view, the lord was most concerned to give his tenant a suitable education, in order to qualify him the better to perform those services which in his maturity he was bound to render.

When the male heir arrived to the age of twenty-one, or the heir female to that of sixteen, they might sue out their livery or *ousterlemain*; that is, the delivery of their lands out of their guardian's hands. For this they were obliged to pay a fine, namely, half-a-year's profits of the land: though this seems expressly contrary to *magna charta*. However, in consideration of their lands having been so long in ward, they were excused all reliefs, and the king's tenants all primer feisins. In order to ascertain the profits that arose to the crown by these fruits of tenure, and to grant the heir his livery, the itinerant justices, or justices in eyre, had it formerly in charge to make inquisition concerning them by a jury of the county, commonly called an *inquisitio post mortem*; which was instituted to enquire (at the death of any man of fortune) the value of his estate, the tenure by which it was holden, and who, and of what age, his heir was; thereby to ascertain the relief and value of the primer feisin, or the wardship and livery accruing to the king thereupon. A manner of proceeding that came in process of time to be greatly abused, and at length an intolerable grievance; it being one of the principal accusations against Empson and Dudley, the wicked engines of Henry VII. that by colour of false inquisitions they compelled many persons to sue out livery from the crown, who by no means were tenants thereunto. And afterwards a court of wards and liveries was erected, for conducting the same enquiries in a more solemn and legal manner.

When the heir thus came of full age, provided he held a knight's fee, he was to receive the order of knighthood, and was compellable to take it upon him, or else pay a fine to the king. For in those heretical times no person was qualified for deeds of arms and chivalry who had not received this order, which was conferred with much preparation and solemnity. We may plainly discover the footsteps of a similar custom in what Tacitus relates of the Germans, who, in order to qualify their young men to bear arms, presented them in a full assembly with a shield and lance; which ceremony is supposed to have been the original of the feudal knighthood. This prerogative, of compelling the vassals to be knighted, or to pay a fine, was expressly recognised in parliament by the statute *de militibus*, 1 Edw. II.; was exerted as an expedient for raising money by many of our best princes, particularly by Edw. VI. and Queen Elizabeth; but this was the occasion of heavy murmurs when exerted by Charles I.: among whose many misfortunes it was, that neither himself nor his people seemed able to distinguish between the arbitrary stretch and the legal exertion of prerogative. However, among the other concessions made by that unhappy prince before the fatal recourse to arms, he agreed to divest himself of this undoubted flower of the crown; and it was accordingly abolished by statute 16 Car. I. c. 20.

WARE, a town of Hertfordshire, with a market on Tuesdays, and a fair on the last Tuesday in April, and Tuesday before St. Matthew's day (Sep. 21.), for horses and other cattle. It is a large, well frequented, and well inhabited thoroughfare town, seated on the river Lea, twenty-one miles north of London. It carries on a great trade in malt and

corn, which they are continually sending in large quantities to London. E. Long. 0. 3. N. Lat. 51. 50.

WARN, in law, is to summon a person to appear in a court of justice.

WARP, in the manufactures, a name for the threads, whether of silk, wool, linen, hemp, &c. that are extended lengthwise on the weaver's loom; and across which the workman, by means of his shuttle, passes the threads of the woof, to form a cloth, riband, fustians, or the like.

WARP, a small rope employed occasionally to remove a ship from one place to another, in a port, road, or river. And hence,

To WARP, is to change the situation of a ship, by pulling her from one part of a harbour, &c. to some other, by means of warps, which are attached to buoys; to anchors sunk in the bottom; or to certain stations upon the shore, as posts, rings, trees, &c. The ship is accordingly drawn forwards to those stations, either by pulling on the warps by hand, or by the application of some purchase, as a tackle, windlass, or capstan, upon her deck. When this operation is performed by the ship's lesser anchors, these machines, together with their warps, are carried out in the boats alternately towards the place where the ship is endeavouring to arrive: so that when she is drawn up close to one anchor, the other is carried out to a competent distance before her, and being sunk, serves to fix the other warp, by which she is farther advanced. Warping is generally used when the sails are vaned, or when they cannot be successfully employed, which may either arise from the unfavourable state of the wind, the opposition of the tide, or the narrow limits of the channel.

WARRANT, is a power and charge to a constable or other officer to apprehend a person accused of any crime. It may be issued in extraordinary cases by the privy-council, or secretaries of state; but most commonly it is issued by justices of the peace. This they may do in any cases where they have a jurisdiction over the offence, in order to compel the person accused to appear before them; for it would be absurd to give them power to examine an offender, unless they had also power to compel him to attend and submit to such examination. And this extends to all treasons, felonies, and breaches of the peace; and also to all such offences as they have power to punish by statute. Before the granting of the warrant, it is fitting to examine upon oath the party requiring it, as well to ascertain that there is a felony or other crime actually committed, without which no warrant should be granted; as also to prove the cause and probability of suspecting the party against whom the warrant is prayed.

This warrant ought to be under the hand and seal of the justice; should set forth the time and place of making, and the cause for which it is made; and should be directed to the constable, or other peace-officer, or it may be to any private person by name. A general warrant to apprehend all persons suspected, without naming or particularly describing any person in special, is illegal and void for its uncertainty; for it is the duty of the magistrate, and ought not to be left to the officer, to judge of the ground of suspicion. Also a warrant to apprehend all persons guilty of such a crime, is no legal warrant; for the point upon which its authority rests, is a fact to be decided on a subsequent trial; namely, whether the person apprehended thereupon be guilty or not guilty. When a warrant is received by the officer, he is bound to execute it, so far as the jurisdiction of the magistrate and himself extends. A warrant from any of the justices of the court of king's bench extends over all the

kingdom, and is tested or dated *England*: but a warrant of a justice of the peace in one county, must be backed, that is, signed, by a justice of another county, before it can be executed there. And a warrant for apprehending an English or Scotch offender, may be indoried in the opposite kingdom, and the offender carried back to that part of the united kingdom in which the offence was committed.

WARRANT, WARRANTIA, in law, a promise, or covenant, by deed, made by the bargainer for himself and his heirs, to warrant and secure the bargainee and his heirs, against all men, for enjoying the thing agreed on or granted between them.

WARREN (Sir Peter), an admiral, distinguished by his virtue, learning, and undaunted courage, was descended from an ancient family in Ireland, and received a suitable education to qualify him for a command in the royal navy, in which he served for several years with great reputation; but the transaction which placed his great abilities in their full light, was the taking of Louisbourg in the year 1745, when he was appointed commodore of the British squadron sent on that service. He joined the fleet of transports, from Boston in Canada, on the 25th of April, having under his command the *Superb* of 60, and the *Launceston* and *Eltham* of 40 guns; he was afterwards joined by several other men-of-war sent from England, and took possession of Louisbourg on the 17th of June. The French, exasperated at this loss, were constantly on the watch to retake it; and in 1747 fitted out a large fleet for that purpose, and at the same time another squadron to prosecute their success in the East Indies. These squadrons sailed at the same time; but the views of the French were rendered abortive by the gallant Admiral Anson and Sir Peter Warren, who had been created rear-admiral, who with a large fleet of ships fell in with the French, defeated the whole fleet, and took the greatest part of the men-of-war. This was the last service Sir Peter rendered to his country as a commander in the British fleet; for a peace being concluded in the succeeding year, the fleet was laid up in the several harbours. He was now chosen one of the representatives in parliament for Westminster; and in the middle of his popularity he paid a visit to Ireland, his native country, where he died of an inflammatory fever in 1752, sincerely lamented by all ranks of people; and an elegant monument of white marble was erected to his memory in Westminster abbey.

WARREN, is a franchise or place privileged by prescription or grant from the king, for the keeping of beasts and fowls of the warren; which are hares and coney, partridges, pheasants, and some add quails, woodcocks, and water-fowl, &c. These being *feræ naturæ*, every one had a natural right to kill as he could: but upon the introduction of the forest laws at the Norman conquest, these animals being looked upon as royal game, and the sole property of our savage monarchs, this franchise of free-warren was invented to protect them, by giving the grantee a sole and exclusive power of killing such game, so far as his warren extended; on condition of his preventing other persons. A man therefore that has the franchise of warren, is in reality no more than a royal game-keeper: but no man, not even a lord of a manor, could by common law justly sport on another's soil, or even on his own, unless he had the liberty of free warren. This franchise is almost fallen into disrepute since the new statutes for preserving the game; the name being now chiefly preserved in grounds that are set apart for breeding hares and rabbits. There are many instances of keen sportsmen in ancient times, who have sold their estates, and reserved the free-warren, or right of killing game, to themselves: by which means it comes to pass that a man and his heirs have sometimes free-warren over another's ground.

A warren may lie open; and there is no necessity of inclosing it as there is of a park. If any person offend in a free-warren, he is punishable by the common law, and by statute 21 Edw. III. And if any one enter wrongfully into any warren, and chase, take, or kill, any coney without the consent of the owner, he shall forfeit treble damages, and suffer three months imprisonment, &c. by 22 and 23 Car. II. c. 25. When coney are on the soil of the party, he hath a property in them, by reason of the possession, and action lies for killing them; but if they run out of the warren and eat up a neighbour's corn, the owner of the land may kill them, and no action will lie.

WARSAW, a large city of Poland, the capital of that country, and of the province of Malovia. It is built partly in a plain, and partly on a gentle ascent rising from the banks of the Vistula, which is about as broad as the Thames at Westminster, but very shallow in summer. This city and its suburbs occupy a vast extent of ground, and are supposed to contain 70,000 inhabitants, among whom are a great number of foreigners. The whole has a melancholy appearance, exhibiting the strong contrast of wealth and poverty, luxury and distress, which pervades every part of this unhappy country. The streets are spacious, but ill paved; the churches and public buildings are large and magnificent; the palaces of the nobility are numerous and splendid; but the greatest part of the houses, particularly in the suburbs, are mean and ill-constructed wooden hovels.—Warsaw is 160 miles south-east by south of Dantzic, 130 north-north-east of Craew, and 300 north-east by north of Vienna. E. Long. 21. 6. N. Lat. 50. 14.

WART, a small knotty kind of tumor which most frequently rises on the skin of the hands. Many ridiculous cures have been suggested for them by old women, and these have been kept in countenance by the *spontaneous disappearance* of warts, which frequently happens. When a remedy is thought necessary, touching them once a day with *Tincture of muriatic acid* is a very good one.

WARWICK, the capital of Warwickshire in England, and from which this county derives its name. It is very ancient, and supposed by Camden to be the place called by the Romans *Præstidium*, where the Dalmatian horse were posted. It stands on a rock of free-stone, of which all the public edifices in the town are built. At the Norman invasion it was a considerable place; and had many burgesses, of whom twelve were obliged by their tenure to accompany the king in his wars. It is supplied with water brought in pipes from springs half a mile from the town, besides what it derives from the wells within it made in the rock: and it is easily kept clean, by being situated upon a declivity. Four streets, from the four cardinal points of the compass, meet in the centre of the town. The principal public buildings are St. Mary's, a very stately edifice, an hospital, a town-house of free-stone, three charity schools, and a noble bridge over the Avon. It has had several charters; but is governed at present by a mayor, twelve brethren, twenty-four burgesses, &c. It is a very handsome populous town, and gives title of earl to the family of the Greylles. W. Long. 1. 36. N. Lat. 52. 20.

WASH, among distillers, the fermentable liquor used by the malt distillers. See **BREWERY**.

WASHING, in painting, is when a design, drawn with a pen or crayon, has some one colour laid over it with a pencil, as Indian ink, bistre, or the like, to make it appear the more natural, by adding the shadow of prominences, apertures, &c. and by imitating the particular matters whereof the thing is supposed to consist. Thus they wash with a pale red, to imitate brick and tile; with a pale Indian blue, to imitate

water and slate; with green, for trees and meadows; with saffron or French berries, for gold or brás; and with several colours for marbles.

WASHING OF Ores, the purifying an ore of any metal, by means of water, from earths and stones, which would otherwise render it difficult of fusion.

WASHINGTON, a city of North America, now building for the metropolis of the United States. It is seated at the junction of the rivers Potomac and the Eastern Branch, extending about four miles up each, including a tract of territory scarcely to be exceeded, in point of convenience, salubrity, and beauty, by any in the world. This territory, which is called *Columbia*, lies partly in the state of Virginia, and partly in that of Maryland, and was ceded by these two states to the United States of America, and by them established to be the seat of government after the year 1800. It is divided into squares or grand divisions, by streets running due north, and south, and east, and west, which form the ground-work of the plan. However, from the Capitol, the president's house, and some of the important areas in the city, run diagonal streets, from one material object to another, which not only produce a variety of charming prospects, but remove the insipid fameness which renders some other great cities unpleasing. The great leading streets are all 160 feet wide, including a pavement of ten feet, and a gravel walk of thirty feet planted with trees on each side, which will leave eighty feet of paved street for carriages. The rest of the streets are in general 110 feet wide, with a few only ninety feet, except North, South, and East Capitol streets, which are 160 feet. The diagonal streets are named after the respective states composing the Union, while those running north and south are, from the Capitol east-ward, named *East First-street*, *East Second-street*, &c. and those west of it are in the same manner called *West First-street*, *West Second-street*, &c. Those running east and west are from the Capitol northward named *North A-street*, *North B-street*, &c. and those south of it are called *South A-street*, *South B-street*, &c. The squares or divisions of the city amount to 1150. The rectangular squares generally contain from three to six acres, and are divided into lots of from forty to eighty feet in front, and their depth from about 110 to 300 feet, according to the size of the square. The irregular divisions produced by the diagonal streets are some of them small, but generally in valuable situations. Their acute points are all to be cut off at forty feet, so that no house in the city will have an acute corner. All the houses must be of brick or stone. The area for the Capitol (or house for the legislative bodies) is situated upon the most beautiful eminence in the city, about a mile from the Eastern Branch, and not much more from the Potomac, commanding a full view of every part of the city, as well as a considerable extent of the country around. The president's house will stand upon a rising ground, not far from the banks of the Potomac, possessing a delightful water prospect, with a commanding view of the Capitol, and some other material parts of the city.

The city being situated upon the great post road, exactly equidistant from the northern and southern extremities of the Union, and nearly so from the Atlantic Ocean to the river Ohio, upon the best navigation, and in the midst of the richest commercial territory in America, commanding the most extensive internal resources, is by far the most eligible situation for the residence of congress; and it is now pressing forward, by the public-spirited enterprize, not only of the people of the United States, but also of foreigners.

WASP, in zoology. See *VESPA*.

WATCH, in the art of war, a number of men posted at any passage, or a company of the guards who go on the patrol.

WATCH, in the navy, the space of time wherein one division of a ship's crew remains upon deck, to perform the necessary services, whilst the rest are relieved from duty, either when the vessel is under sail or at anchor. The length of the sea-watch is not equal in the shipping of different nations. It is always kept four hours by our British seamen, if we except the dog-watch, between four and eight in the evening, that contains two reliefs, each of which are only two hours on deck. The intent of this is to change the period of the night-watch every twenty-four hours; so that the party watching from eight till twelve in one night, shall watch from midnight till four in the morning on the succeeding one. In France the duration of the watch is extremely different, being in some places six hours, and in others seven or eight; and in Turkey and Barbary it is usually five or six hours. A ship's company is usually classed into two parties; one of which is called the *starboard* and the other the *larboard* watch. It is, however, occasionally separated into three divisions, as in a road, or in particular voyages. In a ship of war the watch is generally commanded by a lieutenant, and in merchant-ships by one of the mates; so that if there are four mates in the latter, there are two in each watch; the first and third being in the larboard, and the second and fourth in the starboard watch: but in the navy, the officers who command the watch usually divide themselves into three parties, in order to lighten their duty.

WATCH, is also used for a small portable movement, or machine, for the measuring of time; having its motion regulated by a spiral spring. Watches, strictly taken, are all such movements as show the parts of time; as clocks are such as publish it, by striking on a bell, &c. But commonly the name *watch* is appropriated to such as are carried in the pocket; and *clock* to the large movements, whether they strike the hour or not. See *CLOCK*.

The invention of spring or pocket watches belongs to the present age. It is true, we find mention made of a watch presented to Charles V. in the history of that prince: but this, in all probability, was no more than a kind of clock to be set on a table, some resemblance whereof we have still remaining in the ancient pieces made before the year 1670. There was also a story of a watch having been discovered in Scotland belonging to King Robert Bruce; but this we believe has turned out altogether apocryphal. The glory of this very useful invention lies between Dr. Hooke and M. Huyghens; but to which of them it properly belongs, has been greatly disputed; the English ascribing it to the former, and the French, Dutch, &c. to the latter. Mr. Derham, in his *Artificial Clockmaker*, says roundly, that Dr. Hooke was the inventor; and adds, that he contrived various ways of regulation. One way was with a loadstone: another with a tender straight spring, one end whereof played backwards and forwards with the balance; so that the balance was to the spring as the bob to a pendulum, and the spring as the rod thereof: a third method was with two balances, of which there were divers sorts; some having a spiral spring to the balance for a regulator, and others without. But the way that prevailed, and which continues in mode, was with one balance, and one spring running round the upper part of the verge thereof: though this has a disadvantage, which those with two springs, &c. were free from; in that a sudden jerk, or confused shake, will alter its vibrations, and put it in an unusual hurry.

The time of these inventions was about the year 1658; as appears, among other evidences, from an inscription on one of the double-balance watches presented to King Charles II. viz. *Robt. Hooke inven. 1658. T. Tompion fecit, 1675*. The invention presently got into reputation, both at home and abroad; and two of them were sent for by the dauphin of

France. Soon after this, M. Huygens's watch with a spiral spring got abroad, and made a great noise in England, as if the longitude could be found by it. It is certain, however, that his invention was later than the year 1673, when his book *de Horol. Oscillant.* was published; wherein he has not one word of this, though he has of several other contrivances in the same way.

One of these the Lord Brouncker sent out of France, where M. Huygens had got a patent for them. This watch agreed with Dr. Hooke's in the application of the spring to the balance; only M. Huygens's had a longer spiral spring, and the pulses and beats were much slower. The balance, instead of turning quite round, as Dr. Hooke's, turns several rounds every vibration.

Mr. Derham suggests, that he has reason to doubt M. Huygens's fancy first was set to work by some intelligence he might have of Dr. Hooke's invention from Mr. Oldenburg, or some other of his correspondents in England; and this, notwithstanding Mr. Oldenborth's attempt to vindicate himself in the Philosophical Transactions, appears to be the truth. Huygens invented divers other kinds of watches, some of them without any spring or chain at all; which he called, particularly, *pendulum watches.*

Striking WATCHES are such as, besides the proper watch-part for measuring of time, have a clock-part for striking the hours, &c.

Repeating WATCHES, are such as by pulling a spring, &c. repeat the hour, quarter, or minute, at any time of the day or night.—This repetition was the invention of Mr. Barlow, and first put in practice by him in larger movements or clocks about the year 1676. The contrivance immediately set the other artists to work, who soon contrived divers ways of effecting the same. But its application to pocket-watches was not known before King James the Second's reign; when the ingenious inventor above mentioned, having directed Mr. Thompson to make a repeating watch, was soliciting a patent for the same. The talk of a patent engaged Mr. Quare to resume the thoughts of a like contrivance, which he had had in view some years before: he now effected it, and being pressed to endeavour to prevent Mr. Barlow's patent, a watch of each kind was produced before the king and council; upon trial of which, the preference was given to Mr. Quare's. The difference between them was, that Barlow's was made to repeat by pushing in two pieces on each side the watch-box; one of which repeated the hour, and the other the quarter: whereas Quare's was made to repeat by a pin that stuck out near the pendant, which being thrust in (as now it is done by thrusting in the pendant itself), repeated both the hour and quarter with the same thrust.

Of the Mechanism of a WATCH, properly so called. Watches, as well as clocks, are composed of wheels and pinions, and a regulator to direct the quickness or slowness of the wheels, and of a spring which communicates motion to the whole machine. But the regulator and spring of a watch are vastly inferior to the weight and pendulum of a clock, neither of which can be employed in watches. In place of a pendulum, therefore, we are obliged to use a balance (Pl. 32. vol. IX. fig. 1.) to regulate the motion of a watch; and a spring (fig. 2.) which serves in place of a weight, to give motion to the wheels and balance.

The wheels of a watch, like those of a clock, are placed in a frame formed of two plates and four pillars. Fig. 3. represents the inside of a watch, after the plate (fig. 4.) is taken off. A is the barrel which contains the spring (fig. 2.); the chain is rolled about the barrel, with one end of it fixed to the barrel A (fig. 5.), and the other to the fusee B.

When a watch is wound up, the chain which was upon the

barrel winds about the fusee, and by this means the spring is stretched; for the interior end of the spring is fixed by a hook to the immovable axis about which the barrel revolves; the exterior end of the spring is fixed to the inside of the barrel, which turns upon an axis. It is therefore easy to perceive how the spring extends itself, and how its elasticity forces the barrel to turn round, and consequently obliges the chain which is upon the fusee to unfold and turn the fusee; the motion of the fusee is communicated to the wheel C (fig. 5.); then, by means of the teeth, to the pinion *e*, which carries the wheel D; then to the pinion *d*, which carries the wheel E; then to the pinion *e*, which carries the wheel F; then to the pinion *f*, upon which is the balance-wheel G, whose pivot runs in the pieces A called the *potance*, and B called a *follower*, which are fixed on the plate fig. 4. This plate, of which only a part is represented, is applied to that of fig. 3. in such a manner that the pivots of the wheels enter into holes made in the plate fig. 3. Thus the impelled force of the spring is communicated to the wheels: and the pinion *f* being then connected to the wheel F, obliges it to turn (fig. 5.) This wheel acts upon the palettes of the verge 1, 2 (fig. 1.), the axis of which carries the balance HH (fig. 1.) The pivot I, in the end of the verge, enters into the hole *c* in the potance A (fig. 4.) In this figure the palettes are represented; but the balance is on the other side of the plate, as may be seen in fig. 6. The pivot 3 of the balance enters into a hole of the cock BC (fig. 7.), a perspective view of which is represented in fig. 8. Thus the balance turns between the cock and the potance *c* (fig. 4.), as in a kind of cage. The action of the balance-wheel upon the palettes 1, 2 (fig. 1.), is the same with what we have described with regard to the same wheel in the clock; i. e. in a watch, the balance-wheel obliges the balance to vibrate backwards and forwards like a pendulum. At each vibration of the balance a palette allows a tooth of the balance-wheel to escape; so that the quickness of the motion of the wheels is entirely determined by the quickness of the vibrations of the balance; and these vibrations of the balance and motion of the wheels are produced by the action of the spring.

But the quickness or slowness of the vibrations of the balance depend not solely upon the action of the great spring, but chiefly upon the action of the spring *a, b, c*, called the *spiral spring* (fig. 9.), situated under the balance H, and represented in perspective (fig. 6.) The exterior end of the spiral is fixed to the pin *a* (fig. 9.) This pin is applied near the plate in *a* (fig. 6.); the interior end of the spiral is fixed by a peg to the centre of the balance. Hence if the balance is turned upon itself, the plates remaining immovable, the spring will extend itself, and make the balance perform one revolution. Now, after the spiral is thus extended, if the balance be left to itself, the elasticity of the spiral will bring back the balance, and in this manner the alternate vibrations of the balance are produced.

In fig. 5. all the wheels above described are represented in such a manner, that you may easily perceive at first sight how the motion is communicated from the barrel to the balance.

In fig. 10. are represented the wheels under the dial-plate by which the hands are moved. The pinion *a* is adjusted to the force of the prolonged pivot of the wheel D (fig. 5.), and is called a *cannon pinion*. This wheel revolves in an hour. The end of the axis of the pinion *a*, upon which the minute-hand is fixed, is square; the pinion (fig. 10.) is indented into the wheel *b*, which is carried by the pinion *a*. Fig. 11. is a wheel fixed upon a barrel, into the cavity of which the pinion *a* enters, and upon which it turns freely. This wheel revolves in twelve hours, and carries along with it the hour-hand. For a full account of the principles upon which

watches and all time-keepers are constructed, we must refer our readers to a short treatise, entitled *Thoughts on the Means of Improving Watches*, by Thomas Mudge.

WATCH-glasses, in a ship, are glasses employed to measure the period of the watch, or to divide it into any number of equal parts, as hours, half-hours, &c. so that the several stations therein may be regularly kept and relieved, as at the helm, pump, look-out, &c.

WATCHING, in medicine, is when the patient cannot sleep. In fevers it is a dangerous symptom, and if long continued ends in a delirium.

WATER, a well-known fluid, diffused through the atmosphere, and over the surface of the globe, and abounding in a certain proportion in animals, vegetables, and minerals. The uses of water are so universally known, that it would be superfluous to enumerate them in this article. It is essential to animal and vegetable life; it makes easy the intercourse between the most distant regions of the world; and it is one of the most useful powers in the mechanic arts. It is often found combined with various substances, and is then frequently beneficial in curing or alleviating diseases. Those properties of water which fit it for answering mechanical purposes are explained in other articles of this Work (see **HYDROSTATICS**, **PNEUMATICS**, **RESISTANCE**, and **RIVERS**); but for an account of the celebrated discovery of the composition of water, and the various substances which are often found chemically united with it, see **CHEMISTRY**, vol. II. p. 407.

The ancient philosophers considered water as one of the four elements. During the age of the alchemists, when it was believed that different substances could be converted into gold, it was also an opinion, adopted by many, that water could be changed into earth. Even so late as the time of Mr. Boyle this sentiment was not laid aside. He relates, that a friend of his, by distilling a quantity of water an hundred times, found at length that he had got six-tenths of the first quantity in earth: whence he concludes, that the whole water, by further prosecuting the operation, might be converted into earth. Others have made experiments to the same purpose, and seemingly with the same success; but the deception is now found out. Water has the power of corroding the hardest bodies, even glass itself, by long digestion, especially when assisted by heat; and hence those who have made the experiments just mentioned have been themselves deceived, by supposing the earth which really came from the containing vessel to come from the water.

Margraaf made several experiments to determine whether water be transmutable into earth, and found that after every distillation a sediment was left. Lavoisier repeated Margraaf's experiments, and gave the explanation which we alluded to, that the sediment consisted of portions of the glass separated by the water. Dr. Black goes still farther; he ingeniously supposes, that the alkali, which is an essential ingredient in the composition of glass, unites with the water, and makes the glass swell, and thus occasions small portions of it to be detached.

Of late it has been discovered that charcoal possesses many unexpected properties, and, among others, that of preserving water from corruption, and of purifying it after it has been corrupted. Mr. Lowitz, whose experiments on charcoal have been published in *Crell's Chemical Journal*, has turned his attention to this subject in a memoir read to the Economical Society of Petersburg. He found that the effect of charcoal was rendered much more speedy by using along with it some sulphuric acid. One ounce and a half of charcoal in powder, and 24 drops of concentrated sulphuric acid (oil of vitriol), are sufficient to purify three pints and a half of corrupted water, and do not communicate to it any sensible acidity. This

small quantity of acid renders it unnecessary to use more than a third part of the charcoal powder which would otherwise be wanted; and the less of that powder is employed, the less is the quantity of water lost by the operation, which, in sea-voyages, is an object worthy of consideration. In proportion to the quantity of acid made use of, the quantity of charcoal may be diminished or augmented. All acids produce nearly the same effects: neutral salts also, particularly nitre and sea-salt, may be used, but sulphuric acid is preferable to any of these; water which is purified by means of this acid, and charcoal, will keep a longer time than that which is purified by charcoal alone. When we mean to purify any given quantity of corrupted water, we should begin by adding to it as much powder of charcoal as is necessary to deprive it entirely of its bad smell. To ascertain whether that quantity of powdered charcoal was sufficient to effect the clarification of the said water, a small quantity of it may be passed through a linen bag, two or three inches long; if the water, thus filtrated, still has a turbid appearance, a fresh quantity of powdered charcoal must be added, till it is become perfectly clear: the whole of the water may then be passed through a filtering bag, the size of which should be proportioned to the quantity of water. If sulphuric acid, or any other, can be procured, a small quantity of it should be added to the water, before the charcoal powder.

The cleaning of the casks in which water is to be kept in sea-voyages should never be neglected: they should be well washed with water and sand, or with any other substance capable of removing the mucilaginous particles, and afterwards a quantity of charcoal-dust should be applied. A still better method perhaps would be to rinse them with a pretty strong solution of oil of vitriol and water, which will entirely deprive them of the musty or putrid smell they may have contracted.

SEA-WATER. See **SEA-WATER**.

WATER-Carts: carriages constructed for the purpose of watering the roads for several miles round London; a precaution absolutely necessary near the metropolis, where, from such a vast daily influx of carriages and horses, the dust would otherwise become quite insufferable in hot dry weather. Pumps are placed at proper distances to supply these carts.

WATER-Ordeal. See **ORDEAL**.

WATER, among jewellers, is properly the colour or lustre of diamonds and pearls. The term, though less properly, is sometimes used for the hue or colour of other stones.

WATER-Bellows. See *Machines for blowing Air into Furnaces*.

WATER-Colours, in painting, are such colours as are only diluted and mixed up with gum-water, in contradistinction to oil-colours. See **COLOUR-Making**.

WATER-Gang, a channel cut to drain a place by carrying off a stream of water.

WATER-Hen. See **PARRA**.

WATER-Line of a Ship, certain horizontal lines supposed to be drawn about the outside of a ship's bottom, close to the surface of the water in which the floats. They are accordingly higher or lower upon the bottom, in proportion to the depth of the column of water required to float her.

WATER-Logged, the state of a ship when, by receiving a great quantity of water into the hold, by leaking, &c. she has become heavy and inactive upon the sea, so as to yield without resistance to the efforts of every wave rushing over her decks. As, in this dangerous situation, the centre of gravity is no longer fixed, but fluctuating from place to place, the stability of the ship is utterly lost: she is therefore almost totally deprived of the use of her sails, which would operate to overlist her, or press the head under water. Hence there is no resource for the crew, except to free her by the pumps, or to abandon her by the boats as soon as possible.

WATER-Sail, a small sail spread occasionally under the lower fludding-sail, or driver-boom, in a fair wind and smooth sea.

WATER-Ouzel. See **TURBUS**.

WATER-Spout, an extraordinary meteor consisting of a large mass of water collected into a sort of column, and moved with rapidity along the surface of the sea.

The best account of the water-spout which we have met with is in the *Phil. Trans.* Abridged, vol. viii, as observed by Mr Joseph Harris, May 21, 1732, about sunset, lat. $32^{\circ} 30'$ N. long. 90° E. from Cape Florida. "When first we saw the spout (says he), it was whole and entire, and much of the shape and proportion of a speaking trumpet; the small end being downwards, and reaching to the sea, and the big end terminated in a black thick cloud. The spout itself was very black, and the more so the higher up. It seemed to be exactly perpendicular to the horizon, and its sides perfectly smooth, without the least ruggedness. Where it fell the spray of the sea rose to a considerable height, which made somewhat the appearance of a great smoke. From the first time we saw it, it continued whole about a minute, and till it was quite dissipated about three minutes. It began to waste from below, and so gradually up, while the upper part remained entire, without any visible alteration, till at last it ended in the black cloud above: upon which there seemed to fall a very heavy rain in that neighbourhood.—There was but little wind, and the sky elsewhere was pretty serene."

Water-spouts have by some been supposed to be merely electrical in their origin; particularly by Signior Beccaria, who supported his opinion by some experiments. But if we attend to the successive phenomena necessary to constitute a complete water-spout through their various stages, we shall be convinced, that recourse must be had to some other principle in order to obtain a complete solution.

Dr. Franklin, in his *Physical and Meteorological Observations*, supposes a water-spout and a whirlwind to proceed from the same cause; their only difference being, that the latter passes over the land, and the former over the water. This opinion is corroborated by M. de la Pryme, in the *Philosophical Transactions*, where he describes two spouts observed at different times in Yorkthire, whose appearances in the air were exactly like those of the spouts at sea, and their effects the same as those of real whirlwinds.

A fluid moving from all points horizontally towards a centre, must at that centre either mount or descend. If a hole be opened in the middle of the bottom of a tub filled with water, the water will flow from all sides to the centre, and there descend in a whirl: but air flowing on or near the surface of land or water, from all sides towards a centre, must at that centre ascend; because the land or water will hinder its descent.

The doctor, in proceeding to explain his conceptions, begs to be allowed two or three positions, as a foundation for his hypothesis. 1. That the lower region of air is often more heated, and so more rarefied, than the upper, and by consequence specifically lighter. The coldness of the upper region is manifested by the hail, which sometimes falls from it in warm weather. 2. That heated air may be very moist, and yet the moisture less equally diffused and rarefied as hot to be visible till colder air mixes with it; at which time it condenses and becomes visible. Thus our breath, although invisible in summer, becomes visible in winter.

These circumstances being granted, he presupposes a tract of land or sea, of about 60 miles in extent, unsheltered by clouds and unrefreshed by the wind, during a summer's day, or perhaps for several days without intermission, till it becomes violently heated, together with the lower region of the air in contact with it; so that the latter becomes specifically lighter than the superincumbent higher region of the atmosphere,

wherein the clouds are usually floated: he supposes also that the air surrounding this tract has not been so much heated during those days, and therefore remains heavier. The consequence of this, he conceives, should be, that the heated lighter air should ascend, and the heavier descend; and as this rising cannot operate throughout the whole tract at once, because that would leave too extensive a vacuum, the rising will begin precisely in that column which happens to be lightest or most rarefied; and the warm air will flow horizontally from all parts of this column, where the several currents meeting, and joining to rise, a whirl is naturally formed, in the same manner as a whirl is formed in a tub of water, by the descending fluid receding from all sides of the tub towards the hole in the centre.

And as the several currents arrive at this central rising column, with a considerable degree of horizontal motion, they cannot suddenly change it to a vertical one; therefore as they gradually, in approaching the whirl, decline from right to curve or circular lines, so, having joined the whirl, they ascend by a spiral motion: in the same manner as the water descends spirally through the hole in the tub before mentioned.

Lastly, as the lower air nearest the surface is more rarefied by the heat of the sun, it is more impressed by the current of the surrounding cold and heavy air which is to assume its place, and consequently its motion towards the whirl is swiftest, and so the force of the lower part of the whirl strongest, and the centrifugal force of its particles greatest. Hence the vacuum which encloses the axis of the whirl should be greatest near the earth or sea, and diminish gradually as it approaches the region of the clouds, till it ends in a point.

This circle is of various diameters, sometimes very large.

If the vacuum passes over water, the water may rise in a body or column therein to the height of about 32 feet. This whirl of air may be as invisible as the air itself, though reaching in reality from the water to the region of cool air, in which our low summer thunder-clouds commonly float; but it will soon become visible at its extremities. The agitation of the water under the whirling of the circle, and the swelling and rising of the water in the commencement of the vacuum, renders it visible below. It is perceived above by the warm air being brought up to the cooler region, where its moisture begins to be condensed by the cold into thick vapour, and is then first discovered at the highest part, which being now cooled, condenses what rises behind it, and this latter acts in the same manner on the succeeding body; where, by the contact of the vapours, the cold operates faster in a right line downwards, than the vapours themselves can climb in a spiral line upwards: they climb however; and as by continual addition they grow denser, and by consequence increase their centrifugal force, and being risen above the concentrating currents that compose the whirl, they fly off, and form a cloud.

It seems easy to conceive how, by this successive condensation from above, the spout appears to drop or descend from the cloud, although the materials of which it is composed are all the while ascending. The condensation of the moisture contained in so great a quantity of warm air as may be supposed to rise in a short time in this prodigiously rapid whirl, is perhaps sufficient to form a great extent of cloud; and the friction of the whirling air on the sides of the column may detach great quantities of its water, disperse them into drops, and carry them up in the spiral whirl mixed with the air. The heavier drops may indeed fly off, and fall into a shower about the spout; but much of it will be broken into vapour, and yet remain visible.

As the whirl weakens, the tube may apparently separate in the middle; the column of water subsiding, the superior condensed part drawing up to the cloud. The tube or whirl of

air may nevertheless remain entire, the middle only becoming invisible, as not containing any visible matter.

Dr. Lindfay, however, in several letters published in the Gentleman's Magazine, has controverted this theory of Dr. Franklin, and endeavoured to prove, that water-spouts and whirlwinds are distinct phenomena; and that the water which forms the water-spout, does not ascend from the sea, as Dr. Franklin supposes, but descends from the atmosphere. Our limits do not permit us to insert his arguments here, but they may be seen in the Gentleman's Magazine, vol. li. p. 559, 615; vol. liii. p. 1025; and vol. lv. p. 594. We cannot avoid observing, however, that he treats Dr. Franklin with a degree of asperity to which he is by no means entitled, and that his arguments, even if conclusive, prove nothing more than that some water-spouts certainly do descend; which Dr. Franklin hardly ever ventured to deny. There are some very valuable dissertations on this subject by Professor Wilcke of Uplal.

WATER-Works. See **HYDROSTATICS, MECHANICS, and RIVER**, under which we have given all that is essentially necessary on the subject. We shall here however introduce, from the specification of the patent, an account of certain new methods of giving an independent moving power to all machines, by means of hydraulic engines; and also of constructing and employing separately several of their parts, such as wheels, pistons, and apparatus for reducing friction, upon new principles.

The author, Count de Thiville, declares his invention to consist in the application of certain hydrostatical principles not at all or but little known till now, which, contrary to the laws of statics in solid bodies, give to incompressible fluids the property of rising almost spontaneously above the place from which they have fallen.

“Without accounting for the causes (says he), I will confine myself to effects founded on experiments, and give some specimens of these principles, and of the consequences resulting therefrom. Let fig. 1. in Pl. 4. be an empty tube, and stopped at bottom or top air-tight. If it be immersed into water, and suddenly opened, the fluid will rise to *a*, fall to *b*, rise again to *c*, and so on till it fix itself at *d*; which is the level of the fluid. Let fig. 2. be a vertical section of a chest fastened in a large reservoir or pond. Let the front part *a b* revolving at *i* be in the position *i 2*, if it fall suddenly at *i 3*, the water will rise above its level, and a portion will flow out of the chest. Let the front part *a b*, in the situation *i 4*, be counterpoised by a pendulum *V O*, in such a manner that, either at work or at rest, the gravity of *V O* be in the same constant ratio with the gravity of *a b*, then the least possible power impelling on *O*, will communicate motion to *a b* by the rods *B* and *X*, which have a common centre at *V*. If the motion is alternate and regular, *a b* going up and down from *3* to *5*, the water will rise as before, and enter an upper reservoir *q*; besides the front part *a b* striking or impelling on the surface of the fluid at *r*, will form a wave, which will be able to raise a body *Y*, immersed at some distance, and the water withdrawing will abandon the body to its own weight, which effect may be productive of a power. If the water is prevented from going out of the chest, by the front part being lengthened as at *c*, this front part being alternately and gradually loaded with, and unloaded from, the weight of water, will produce a gradual and disposable power, which will be still greater if the chest be situated out of the reservoir, communicating with it by its back part only. If an empty vessel *K* intercept that communication, the valve at *7* being suddenly opened, the water will rise to *9*. If *7* be shut, and the valve *6* opened at the moment the front part *a b* falls from *i 2*, to *i 3*, *9* will fall in *8*, and so on, so that if a body is immersed in the vessel *K*, it will

produce power by going freely up and down. Let a chest, fig. 3. with an aperture *x* in its circular bottom, be placed in a reservoir; if that chest be suspended like a pendulum at *A*, or bearing like a cradle on fixed beams *a b*, or like a mangle on the top of rollers *c d* without centres; if I move the chest alternately and regularly in any of those manners, or otherwise, the water will alternately rise out of the chest, and enter the upper reservoirs *y* and *z*. If the surrounding water be found an obstacle to the motion, the chest may be placed out of the reservoir, and be supplied by a syphon above, or a flexible pipe under the chest, as seen at *q* and *f*, fig. 5. That pipe corresponding with the aperture *x*, fig. 3. Four or more of these chests, *a*, fig. 4. may likewise be established on a floating circular timber-work with apertures at *x*; the intervals *b* between the chests being empty and inaccessible to the water, as seen in the section fig. 4. No. 2. Then if a circular and alternate motion from *1* to *2* round the point *A*, be given, the water will rise and flow in the parts *c*, which belong to an upper reservoir *d*. Let fig. 5. be a chest with flat or circular bottom hanging at *y*, to a beam *z*, turning at *X* upon standards *B*. At *z* hangs another chest *P* ten feet high, and only a few inches thick, immersed in the water, *X y* being to *X z* as one to ten. If *A* contains 100 cubic feet of water, *P* ought to contain little less than 10 feet. The bottom of *A* being nearly level to the surface *l* of the reservoir; if the water enters gradually in *A*, the chest will descend in *O*, and raise *P* to *S*. *P* being suspended at *x*, and so contrived that its upper part when filled be somewhat heavier, and when empty somewhat lighter, than its under part, the consequence will be, that when *P* is disengaged it turns at *x*, discharges its water into *R*, and takes again its former upright situation. But it must be observed, that of whatever materials *P* may be constructed, it must lose a great part of its weight when in water, for instance, 100 pounds. In order to remedy that real disadvantage, I fix in the building a vessel *I*, containing 100 pounds of water on a surface only a few inches deep. To that vessel is fixed an upright pipe *2*, united by a flexible pipe at *3* to another pipe *4*, tied upon the part *X z* of the beam. Another pipe *5* containing 100 pounds of water is fastened to the curved part of the beam; by that means the gravity which *P* loses gradually, entering into water, is repaired gradually by the water entering the pipe *5*, so that an inverse ratio subsists constantly between *P* and *5*. When *A* is arrived and fastened at *O*, the sluice or shuttle *a* of the reservoir, and that *b* of the chest is opened, the front part *T* figs. 5. and 6. upon which the water acts by its lateral pressure being disengaged, falls with an increasing power according to what has been said at fig. 2; a rope or chain *c* fixed in *K*, turns a wheel *H* by means of a hook *i*, which catches the teeth of a ratchet *m*, one of the vessels *5* is raised in *l*, turns in *x*, and makes the same effect as *P*, fig. 6.”

“If (continues the Count) I can raise a large quantity of water, for instance, at the height of one foot only, by the means seen in figs. 2. 3. and 4. I can employ this water as an immediate power, acting on a common water-wheel; but the power which I can derive from the gravity of *A*, fig. 5. being in the order of an arithmetical progression, cannot act on machinery but by the mediate assistance of *P*, which raises the water to nearly five feet. I dispose accordingly an overshot breast-wheel, figs. 7. 8. and 9. in such a manner that the water be conveyed in one or two rows of buckets *l*, by one single or double trough *b*; the water enters the buckets at *x*; they are situated contrary to the usual way; and their lower part is narrower than the upper part as seen in fig. 9; the side parts are beveled or inclined so as to leave between them an interval *a*, fig. 9. by which the water is discharged when each bucket is arrived at *X*, fig. 7. only, which disposition increases consider-

ably the power of the wheel; but in order to produce the best effect, the resistance arising from friction ought to be reduced as much as possible; to that effect let A, figs. 7, 8, and 10. be a chest traversed by the gudgeon *b* of a wheel, to that gudgeon is fixed a hollow cylinder *d*; if the chest be filled with an incompressible fluid, and if besides the cylinder displace a volume of that fluid, equal to the weight which in the usual way is supported by the gudgeon, that weight will be totally transported from the gudgeon to the fluid, and the friction arising from gravity will be totally reduced. Instead of the cylinder *d* being fixed to the axis, it may be independent; the iron axis or even the wooden axletree, in that case turning on its periphery as seen in A 2, and A 3, figs. 8, and 11. If a wheel be to revolve horizontally like a millstone, the cylinder ought to be fixed either at the under part, or at the top of the axis. These wheels, whichever of them I employ, must be provided with a cog-wheel which turns a pinion, the axle of which is a crank, or another pinion with teeth upon half part only of its circumference; which teeth, catching alternately the upper and under teeth of a double rake, give the vibration to the chests or front parts by rods, which means are already well known. The power which is destined to put in motion these different machines, described in figs. 2, 3, 4, 5, and 6, ought to be considered only as a regulator which gives the necessary velocity, engages and disengages at pleasure by any known means, and increases the effect in giving a regular and isochronal motion."

The following observations are annexed by the patentee.

"From what has just been said in my specification above, it may be concluded that the application of the foregoing principles may vary *ad infinitum*. At what height, in what quantity, and at what expense of power, can the water be raised, are likewise liable to great variations, and can only be ascertained by experiment on large scales, and in open water. Some parts of the objects above specified have already had a sort of publicity. About two years ago, I offered to the Royal Society a *Memoir on Friction, and on the Means of reducing it*.

"The object of that memoir was to prove, by experiments, that, between fluids and solid bodies immersed in them, there is neither friction nor absolute resistance. This principle, it is true, is in direct opposition to the doctrine adopted by the learned in philosophy. I made likewise an application, to demonstrate that the problem of a perpetual motion, though inconsistent with the laws of mechanics, was to be resolved by the *phenomena nature*; and that, if it was possible to borrow from nature the materials with which it acts, and consequently to produce effects similar to those which daily occur to our eyes, the problem would be resolved. The ideas contained in my first memoir on friction having been deemed inadmissible, *à fortiori*, such an idea as that now in agitation should be put aside; yet as an observer who has spent much time in considering the subject, I take the liberty to say, to those who maintain that *there is friction and absolute resistance in fluids*, they consequently know what is the quantity of them under certain data. To such I beg leave to propose the following problems:

"*Friction in fluids.* 1. Let A fig. 12. be a cylindric foot of solid matter, the weight of which is only one grain less than an equal volume of water, consequently about fifty pounds weight, that cylinder is supported by B. Let V represent the requisite power, to subdue the resistance which friction opposes to motion; which resistance, according to the admitted doctrine, is about a third of the weight.

"2. Let another cylinder of the same matter and diameter be ten feet long, *ceteris paribus*: let the requisite power be represented by X.

"3. Let both apparatus be totally immersed in water, the power in that new situation being represented by Y if the length is one foot, and by Z if it is ten feet.

"What are the ratios between V and Y, between X and Z, and between Y and Z?"

"*Resistance of Fluids.* 1. Let a cubic foot in the same circumstances as before, *i. e.* weighing about sixty-three pounds, be freely immersed in water, the power to move it, either horizontally or perpendicularly, be represented by X.

"2. Let another solid body be ten feet long, *ceteris paribus*. The power represented by Y.

"3. Let another solid be two feet every way, *i. e.* eight cubic feet, *ceteris paribus*. The power represented by Z.

"What are the respective ratios between X Y and Z?"

The count uses the expression of absolute resistance, to indicate that the velocity of the bodies in motion, or their respective velocities, have no relation at all with the power, which ought to be considered only as destined to subdue the resistance, without any regard to time, *i. e.* whether the effect takes place in the space of two hours, or in that of two seconds.

"*Perpetual Motion.* Without prejudging any thing upon the principles," says the count, "I have introduced in my specification, which principles I consider as a theorem from which every one may draw the corollaries; I will confine myself within the limits I have prescribed, and propose the following problem. Let A, fig. 13. be a wheel or cylinder turning on its gudgeon *b*, *c c c* is an assemblage of sheets of any material or fluid; these sheets pass between thin plates or wires fastened in a fixed box *i i*, at *o o* they pass freely between small cylinders or rollers, turning in another fixed box V. Instead of being so separated, they may be pressed close to each other by passing between two rollers *u u*; thus the apparatus being so disposed, and the level of the water being as at *d e*, I lay the phenomenon of spontaneous ascent of fluids in capillary tubes or spaces, ought to take place between the sheets at *i i*; and it ought not to do so at *o o*, or at *u u*, by their being too close to, or too distant from, each other. That being established, I represent by Y the power acquired by the ascent of the fluid at *i i*; I represent by Z the mechanical resistance, occasioned by the rubbing of the sheets against the cylinders at *o o*, or by their pressure at *u u*. Now I ask how, and at what point, the laws which preside over the phenomena of nature at *i i*, and those which regulate the mechanical effect at *o o*, or *u u*, coincide so as to determine a constant ratio between the power and the resistance; and finally, what is the ratio between Y and Z?"

"It is obvious, that if Z be greater than, or equal to, Y, the machine will remain immovable. If on the contrary Y is greater than Z, the machine once put in motion will never stop.

"I abstain from any comment on the foregoing problems. I must only add, that I do not think I am too sanguine in my expectations, in announcing that a candid and impartial examination of my doctrine may be productive of some advantage to the sciences; and that the arts will derive a great benefit from a proper application of the principles which I have established in the foregoing specification. That doctrine and those principles are explained at full length in a treatise, and in different memoirs which I have composed, and intend to publish, on hydrostatics, and on the motion and resistance of fluids; in which I have carefully avoided all scientific calculations, formulae, &c. and have submitted all my hypotheses to the test of experiment. I shall submit those philosophical episcules to the investigation of the learned in natural philosophy, as soon as a good version from the pen of an abler translator than I am shall be completed."

Note relating to figs. 7. 8. and 9. "Independently of the advantages resulting from the wheel fig. 7. losing no water at all, another advantage, which is not evident at first sight, deserves to be explained. To that effect, let A, fig. 14. represent the actual way of filling the buckets; and B, the method I am now proposing. If these two buckets are placed at equal distance from a common centre of gravity C, and filled with the same quantity of water, it is obvious that, by the position of that water in the buckets, B acts more powerfully than A, and consequently will overpower it upon that centre. If, besides, the impulse or flock of the water on such wheels is worth being reckoned, that impulse acting at *b b*, at a greater distance from the common centre than at *a a*, its power will consequently be greater."

Note relating to figs. 5. and 6. "Four, six, or more chests either rectilinear or curvilinear, acting as seen in figs. 5. and 6. may be disposed as two or three pair of scales. The rods which communicate the motion may be engaged or disengaged at pleasure, so that when one scale of the first pair is in motion to be emptied, the other scale is at rest; the first scale of the second pair is acting by its gradual gravity, and falling from A to O, and the other scale is empty, and rising from O to A, and so on. The whole ought to be so calculated that the water may successively, and almost without interruption, flow out of one of the upright chests P, and that the moving power has only one chest to move. It is understood that the wheels intended to be the moving power belong to any machinery, such as corn or paper-mills, pump-work, or any other machine whatever."

"The following allegations, if they turn out to be founded on facts, will prove much in favour of my opinion, that there is no friction between fluids and solid bodies. If a copper-bottomed ship is examined (which I never had an opportunity to do) as soon as it arrives from a long voyage, I think it will be seen, 1, That the metallic brightness has been restored to the copper by the incessant percussion of the water. 2, That, that effect is the greatest on the parts which are the nearest to the surface of the water. 3, That it decreases in proportion to the distance from that surface. 4, That on all the parts which form the bottom of the ship (at which parts the friction, if any, ought to be more strongly felt, owing as much to their almost horizontal situation as to the column of water bearing heavier upon them, in the ratio of its depth), the copper is totally covered with verdigris, consequently has experienced no friction at all; since an incessant motion, during six months or more, has not been able to produce an effect equal to that which could have been attained by slightly rubbing with the finger during a few minutes. 5, If a piece of copper be taken from the part near the surface of the water, and another near the keel, it will be found that the first has lost of its original thickness, and that the second has lost nothing but by the chemical operation of the acid of the water acting upon the copper. If these assertions be confirmed by facts, they will be strong arguments against the supporters of the doctrine of friction in fluids."

Under the name of WATER-WORKS, may be comprehended almost every hydraulic structure or contrivance; such as, canals, conduits, locks, mills, water-engines, &c. But they may be conveniently arranged under two general heads, 1st, Works which have for their object the conducting, raising, or otherwise managing of water; and, 2^{dly}, Works which derive their efficacy from the impulse or other action of water. The first class comprehends the methods of simply conducting water in aqueducts or in pipes for the supply of domestic consumption or the working of machinery. It comprehends also the methods of procuring the supplies necessary for these purposes, by means of pumps, water or fire engines. It also

comprehends the subsequent management of the water thus conducted, whether in order to make the proper distribution of it according to the demand, or to employ it for the purpose of navigation, by lockage, or other contrivances.—And in the prosecution of these things many subordinate problems will occur, in which practice will derive great advantages from a scientific acquaintance with the subject. The second class of water-works is of much greater variety, comprehending almost every kind of hydraulic machine; and would of itself fill volumes. Many of these have already occurred in various articles of this Dictionary. In describing or treating them, we have tacitly referred the discussion of their general principles, in which they all resemble each other, to some article where they could be taken in a connected body, susceptible of general scientific discussion, independent of the circumstances which of necessity introduced the particular modifications required by the uses to which the structures were to be applied.

WATERFORD, a city and sea-port of Ireland, in a county of the same name, with a bishop's see. It is the second place in the kingdom, and is a wealthy, populous city, enjoying many ample privileges. The streets are narrow, and the air is not very healthy; but it has an excellent harbour, seated as well for trade as any in the world, and ships of the greatest burden may ride at the quay. It stands on the river Sure, eight miles north of St. George's Channel, twenty-six fathoms of Kilkenny, and seventy-five fathoms by west of Dublin. W. Long. 6. 54. N. Lat. 52. 18.

WATERFORD, a county of Ireland, forty-six miles in length, and twenty-five in breadth: bounded on the south by St. George's Channel; on the west by Cork; on the north by the river Sure, which separates it from Tipperary and Kilkenny; and on the east by Waterford Haven, which parts it from Wexford. It contains seventy-one parishes. It is a fine country, very pleasant and rich; and the principal place is of the same name.

WATERING, in the manufactures, is to give a lustre to stuffs, &c. by wetting them lightly with gum-water, and then passing them through the press or calender whether hot or cold. The gum-water ought to be pure, thin, and clear, otherwise the folds of the stuff will all stick together: the operation must also be performed when the water is very hot, that it may penetrate.

WATERING Meadows. See **MEADOWS**.

WATERLAND (Dr. Daniel), a learned English divine, who distinguished himself greatly in theological controversies, was born in 1683 at Wasley in Lincolnshire, of which place his father was rector. He had his academical learning at Magdalen College, Cambridge, where he drew up a useful tract, which went through several editions, entitled, *Advice to a Young Student, with a Method of Study for the first four Years*. In 1713 he became master of the college, was soon after appointed chaplain to George I. and in 1720 preached the first course of lectures founded by Lady Moyer in defence of our Lord's divinity. He went through several promotions: and at the time of his death in 1740 was canon of Windsor, archdeacon of Middlesex, and vicar of Twickenham. Besides his controversial writings, he published two volumes of sermons.

WATLING-STREET. See **WAY**.

WATSON (Dr. Robert), an elegant historian, was born at St. Andrew's, in Scotland, about the year 1730. He was the son of an apothecary of that place, who was also a brewer. Having gone through the usual course of languages and philosophy at the school and university of his native place, and also entered on the study of divinity, a desire of being acquainted with a larger circle of literati, and of improving himself in every branch of knowledge, carried him, first to the

university of Glasgow, and afterwards to that of Edinburgh, where he delivered lectures on rhetoric; and met with the countenance, approbation, and friendship of Lord Kames, Mr. Hume, with other men of genius and learning.

At this time he had become a preacher; and a vacancy having happened in one of the churches of St. Andrew's, he offered himself a candidate for that living, but was disappointed. He afterwards obtained a patent from the crown, constituting him professor of rhetoric and belles-lettres; and read to his students a course of metaphysics and logics on the most enlightened plan. By his history of Philip II. Dr. Watson attained in his life-time a considerable degree of celebrity; and his history of Philip III. published after his death, has added to his fame. Of his last performance, however, he has only completed the four first books; the two last were written by the editor of his manuscript, at the desire of the guardians of his children.

On the death of Principal Tulideph, Dr. Watson, through the Earl of Kinnoull, was appointed his successor; in which station he lived only a few years. He married the daughter of Mr. Shaw, professor of divinity in St. Mary's College, St. Andrew's, and by this lady he had five daughters, who survived him.

WATTS (Dr. Isaac), a learned and eminent dissenting minister, was born at Southampton in 1674, of parents eminent for piety, and considerable sufferers for conscience-sake. In 1699 he was sent up to London for academical education under the tuition of the Reverend Mr. Thomas Rowe; and in 1696 was himself engaged as tutor to the son of Sir John Harpott, baronet, at Stoke Newington. He began to preach in 1698, and met with general acceptance; and after officiating for three years as an assistant to the Rev. Dr. Isaac Chauncy, he succeeded in his pastoral charge in 1702, and continued to preside over that church as long as he lived. Though his whole income did not amount to an hundred a-year, he allotted one third of it to the poor. He died in 1748. His numerous works have rendered his name famous among people of every denomination, both in this and other countries, and they have been translated into a variety of languages. His *Lyrical Poems*, his *Psalms and Hymns*, and his *Divine Songs for Children*, are a sufficient proof of his poetical talents, and have had an amazing number of editions. His logic and philosophy have been much admired. He also wrote works upon a variety of other subjects, and printed several volumes of his sermons. He was admired for the mildness and benevolence of his disposition and the sweetness of his manners. After his death, his works were collected, and published in six volumes quato.

WAVE, in philosophy, a cavity in the surface of water, or other fluids, with an elevation aside thereof. The waves of the sea are of two kinds, natural and accidental. The natural waves are those which are exactly proportioned in size to the strength of the wind, whose blowing gives origin to them. The accidental waves are those occasioned by the wind's reacting upon itself by repercussion from hills and mountains, or high shores, and by the washing of the waves themselves; otherwise of the natural kind, against rocks and shoals: all these causes give the waves an elevation, which they can never have in their natural state. For the height of the waves, and filling them by means of oil, see SEA.

WAVED, in heraldry, is said of a bordure, or any ordinary or charge, in a coat of arms, having its outlines indented in manner of the rising and falling of waves: it is used to denote, that the first of the family in whose arms it stands, acquired its honours by sea-service.

WAVING, in the sea-language, is the making signs to a vessel to come near or keep off.

WAX, or Bees WAX, in natural history, a firm and solid substance, moderately heavy, and of a fine yellow colour, formed by the bees from the pollen of flowers. See ARIS. The best sort is that of a lively yellow colour, and an agreeable smell, somewhat like that of honey: when new, it is toughly, yet easy to break; but by age it becomes harder and more brittle, loses its fine colour, and in a great measure its smell.

It appears that wax and the pollen have for their basis a fat oil, which passes to the state of resin by its combination with oxygene. If the nitric or muriatic acid be digested upon fixed oil for several months, it passes to a state resembling wax. Wax, by repeated distillations, affords an oil which possesses all the properties of volatile oils. It is reduced into water and carbonic acid by combustion. The colouring matter of wax is insoluble in water and in alcohol.

Fixed alkalis dissolve wax, and render it soluble in water. It is this saponaceous solution which forms the punic wax. It may be used as the basis of several colours; and may be made into an excellent paste for washing the hands. Ammoniac likewise dissolves it; and as this solvent is evaporable, it ought to be preferred when it is proposed to use the wax as a varnish.

From the common yellow wax, by bleaching, is formed white wax, sometimes called, very improperly, *virgin-wax*. The greater the surface is in proportion to the quantity, the sooner and more perfectly this operation is performed. The usual way is to melt the wax in hot water; when melted, they press it through a strainer of tolerably fine linen, and pour it into round and very shallow moulds. When hardened by cooling, it is taken out and exposed to the sun and air, sprinkling it now and then with water, and often turning it: by this means it soon becomes white. The best sort is of a clear and almost transparent whiteness, dry, hard, brittle, and of an agreeable smell, like that of the yellow wax, but much weaker.

The common yellow wax is of very great use both in medicine and in many of the arts and manufactures. It has been sometimes given internally in dysenteries and erosions of the intestines; but its great use is in the making of ointments and plasters, and the greater part of those of the shops owe their consistence to it. The white wax is also an ingredient in some of the cerates and ointments of the shops; and is used in making candles, and in many of the nicer arts and manufactures where wax is required.

Sealing-WAX, or Spanish-WAX, is a composition of gum lac, melted and prepared with resins, and coloured with some suitable pigment. There are two kinds of sealing-wax in use; the one hard, intended for sealing letters, and other such purposes, the other soft, designed for receiving the impressions of seals of office to charters, patents, and such written instruments. The best hard red sealing-wax is made by mixing two parts of shell-lac, well powdered, and resin and vermilion, powdered, of each one part, and melting this combined powder over a gentle fire: and when the ingredients seem thoroughly incorporated, working the wax into sticks. Seed-lac may be substituted for the shell-lac; and instead of resin, boiled Venice turpentine may be used. A coarser, hard, red sealing-wax may be made, by mixing two parts of resin, and of shell-lac, or vermilion and red-lead, mixed in the proportion of one part of the vermilion to two of the red-lead, of each one part; and proceeding as in the former preparation. For a cheaper kind, the vermilion may be omitted, and the shell-lac also, for very coarse uses. Wax of other colours is made by substituting other colouring matters for vermilion, as verditer for blue, ivory black for black wax. For uncoloured, soft sealing wax, take of bees-wax, one pound; of tur-

pentine, three ounces; and of olive-oil one ounce; place them in a proper vessel over the fire, and let them boil for some time; and the wax will be then fit to be formed into rolls or cakes for use. For red, black, green, blue, yellow, and purple soft sealing-wax, add to the preceding composition an ounce or more of any ingredients directed above for colouring the hard sealing-wax, and stir the mafs till the colouring ingredients be incorporated with the wax.

WAX-Works, the representation of the faces, &c. of persons living, or dead; made by applying plaster of Paris in a kind of paste, and thus forming a mould containing the exact representation of the features. Into this mould melted wax is poured, and thus a kind of masks is formed; which being painted and set with glass eyes, and the figures dressed in their proper habits, they bear such a resemblance that it is difficult to distinguish between the copy and the original.

WAY, a passage or road. The Roman ways are divided into consular, prætorian, military, and public; and of these we have four remarkable ones in England: the first Watling-street, or Watling-street, leading from Dover to London, Dunstable, Toucester, Atterton, and the Severn, extending as far as Anglesea in Wales. The second, called *Hilkenild* or *Ikenild street*, stretches from Southampton over the river Itis at Newbridge; thence by Camden and Lichfield; then passes the Derwent near Derby, and ends at Tinnmouth. The third, called *Pesse-way*, because in some places it was never perfected, but lies as a large ditch, leads from Cornwall through Devonshire, by Tethbury, near Stow in the Wolds; and beside Coventry to Leicester, Newark, and so to Lincoln. The fourth, called *Erming*, or *Erminge street*, extends from St. David's, in Wales, to Southampton.

WAY Covert, Gang, Hatch. See **COVERT-WAY**, **GANG**, &c.

WAY of a Ship, is sometimes the same as her rake, or run forward or backward: but this term is most commonly understood of her sailing.

WAY-Leaves, in the coal business. See **COALERY**.

Rights of WAYS, in law. This may be grounded on a special permission; as when the owner of the land grants to another a liberty of passing over his grounds, to go to church, to market, or the like: in which case the gift or grant is particular, and confined to the grantee alone; it dies with the person; and if the grantee leaves the country, he cannot assign over his right to any other; nor can he justify taking another person in his company. A way may be also by prescription; as if all the owners and occupiers of such a farm have immemorially used to cross another's ground: for this immemorial usage supposes an original grant, whereby a right of way thus appurtenant to land may clearly be created. A right of way may also arise by act and operation of law; for if a man grants me a piece of ground in the middle of his field, he at the same time tacitly and impliedly gives me a way to come at it; and I may cross his land for that purpose without trespass. For when the law doth give any thing to one, it giveth impliedly whatsoever is necessary for enjoying the same. By the law of the twelve tables at Rome, where a man had the right of way over another's land, and the road was out of repair, he who had the right of way might go over any part of the land he pleased: which was the established rule in public as well as private ways. And the law of England, in both cases, seems to correspond with the Roman.

WAYFARING TREE. See **VIBURNUM**.

WAYWODE, is properly a title given the governors of the chief places in the dominions of the Czar of Muscovy. The palatines, or governors of provinces in Poland, also bear the quality of *waywodes*, or *warwodes*. The Poles likewise call

the princes of Wallachia and Moldavia *waywodes*; as esteeming them no other than on the foot of governors; pretending that Wallachia and Moldavia are provinces of Poland. Everywhere else they are called *hospodars*. Du Cange says, that the name *waywode* is used in Dalmatia, Croatia; and Hungary, for a general of an army: and Leunclavius, in his *Pandects of Turkey*, tells us, it usually signifies *captain* or *commander*.

WEANING, putting a child away from the breast, and bringing it to use common food.

WEAR, or **WEER**, a great flank or dam in a river, fitted for the taking of fish, or for conveying the stream to a mill. New wears are not to be made, or others altered, to the nuisance of the public, under a certain penalty. See **RIVER**.

WEARING, or **VEERING**, in seamanship. See **SEAMANSHIP**.

WEASEL, in zoology. See **MUSTELA**.

WEATHER, the state or disposition of the atmosphere, with regard to moisture or drought, heat or cold, wind or calm, rain, hail, frost, snow, fog, &c. See **ATMOSPHERE**, **RAIN**, **HEAT**, **WIND**, **HAIL**, **FROST**, &c. As it is in the atmosphere that all plants and animals live and breathe, and as that appears to be the great principle of most animal and vegetable productions, alterations, &c. there does not seem any thing, in all philosophy, of more immediate concernment to us than the state of the weather. In effect, all living things are only assemblages, or bundles of vessels, whose juices are kept moving by the pressure of the atmosphere; and which by that motion maintain life. So that any alterations in the rarity or density, the heat, purity, &c. of that fluid necessarily be attended with proportionable ones in these. What great, yet regular alterations, a little change of weather makes in a tube filled with mercury, or spirit of wine, or in a piece of string, &c. every body knows, in the common instance of barometers, thermometers, hygrometers, &c. and it is owing partly to our inattention, and partly to our unequal, intemperate course of living, that we do not feel as great and as regular ones in the tubes, chords, and fibres of our own bodies.

It is certain, a great part of the brute creation have a sensibility, and sagacity, this way, beyond mankind; and yet, without any means or disposition thereto, more than we; except that their vessels, fibres, &c. being, in other respects, in one equable habitude; the same or a proportionable cause from without, has always a like or proportionable effect on them; that is, their vessels are regular barometers, &c. affected only from one external principle; viz. the disposition of the atmosphere; whereas ours are acted on by divers from within, as well as without: some of which check, impede, and prevent, the action of others.

We know of nothing more wanting than a just theory of the weather, on mechanical principles. But, in order to that, a complete history of the weather will be required. If registers were carefully kept in divers parts of the globe, for a good series of years, we should be enabled to determine the directions, breadth, and bounds of the winds, and of the weather they bring with them; the correspondence between the weather of divers places, and the dependence between one sort and another at the same place. In time, no doubt, we might learn to foretell divers great emergencies; as, extraordinary heats, rains, frosts, droughts, dearths, plagues and other epidemical diseases, &c.

The members of our Royal Society, the French Academy of Sciences, and many authors of note, have made considerable essays this way, and the practice of keeping meteorological journals has, of late years, become very general. For

infructions and examples pertaining to this subject, see Phil. Transf. vol. lxx. part ii. art. 16.

Eraf. Bartholin. has observations of the weather for every day throughout the year 1671. Mr. W. Merle made the like at Oxford, for seven years, with a very remarkable care and accuracy. Dr. Plott did the same at the same place, for the year 1684. Mr. Hillier, at Cape Corfe, for the years 1686, 1687. Mr. Hunt, &c. at Gresham College, for the years 1695, 1696. Dr. Derham, at Upminster in Essex, for the years 1691, 1692, 1697, 1698, 1699, 1703, 1704, 1705. Mr. Townley, in Lancashire, in 1697, 1698. Mr. Cunningham, at Emin in China, for the years 1698, 1699, 1700, 1701. Mr. Locke, at Oats in Essex, 1692. Dr. Scheuchzer, at Zurich, in 1708; and Dr. Tilly, at Pifa, the same year. See the Phil. Transactions.

The form of Dr. Derham's observations afford a good specimen of a journal of this kind; observing that he notes the strength of the winds, by 0, 1, 2, 3, &c. and the quantity of rain as it fell through a tunnel, in pounds and centesimals.

Day.	Hour.	Weather.	Wind.	Barometer.	Rain.
27	7	Fair.	S. W.	29 37	1 52
	12	Rain.	S. W. by W.	29 34	
	9	Stormy,	-	29 88	0 29

We have several schemes for keeping meteorological journals or diaries of the weather, extant in the Philosophical Transactions, the Medical Essays of Edinburgh, and in other books. The Ephemerides Ultrajectine may also be consulted. The instruments requisite for such journal, are a barometer, thermometer, anemoscope, and ombrometer, which see in their proper places.

As a specimen of the use of such histories, we shall add some general remarks, drawn from them by Dr. Derham; and, 1. That foggy weather makes the mercury rise in the barometer, as well as the north wind. The cause, he suggests, probably enough, to be the accession of the load of vapour to the former weight of the atmosphere. Misty weather he likewise observes to have the like effect. 2. The cold and heats in England and Switzerland begin and end nearly about the same time: nay, and any remarkable weather, especially if it continue any while, affects one place as well as the other. 3. That the remarkably cold days in June, anno 1708, were found, in Switzerland to precede ours, commonly by about five days, or more; and that the remarkable heats in the following months began to abate in both places about the same time; only somewhat sooner here than there. 4. That though the winds in both places frequently agree, yet they oftener differ. 5. That the barometer is always lower at Zurich than at Upminster, by sometimes one, and sometimes above two English inches; but the common difference is about half an inch. Which may be solved either by supposing Zurich situate one-fourth of a mile higher above the level of the sea than Upminster; or else, by supposing that part of the terraqueous globe, as lying near the line, to be higher, and more distant from the centre than ours is, which lies nearer the pole. 6. That the barometers generally rise and fall together at far distant places: though this agreement of the barometer is not so constant between Zurich and Upminster, as in places nearer home; viz. at London and Paris; where, again, the agreement is not so great as between Upminster and Lancashire. 7. That the variations of the barometer are greatest at the places are nearest the pole. Thus, *e. gr.* the mercury at London has a greater range by two or three lines than at

Paris; and at Paris a greater than at Zurich. In some places near the equinoctial, there is scarce any variation at all. See BAROMETER. 8. That the rain in Switzerland and Italy is much greater in quantity, throughout the year, than that in Essex, yet the rains are more frequent, *i. e.* there are more rainy days, in Essex, than at either of those places. For the proportion of the annual rains that fall in several places and seasons, see RAIN. 9. That cold contributes greatly to rain; and that, apparently, by condensing the suspending vapours, and making them descend. Thus, very cold months, or seasons, are generally followed immediately by very rainy ones; and cold summers are always wet ones. 10. That high ridges of mountains, as the Alps, and the fnows with which they are covered, not only affect the neighbouring places by the cold, rains, vapours, &c. they produce; but even distant countries, as England, often partake of their effects. Thus, the extraordinary colds, December, 1708, and the relaxations thereof, were felt in Italy and Switzerland, several days before they reached us; an indication, Dr. Derham thinks, that they were derived from them to us. See a collection of ingenious observations, and meteorological conjectures by Dr. Franklin, in his Experiments, &c. p. 182, &c. See EVAPORATION, RAIN, and WIND.

Prognosticks of the WEATHER. We do not here mean to obtrude the idle, arbitrary observations of fanciful people upon our readers; but shall confine ourselves to what has a visible foundation in the nature of things.

1. Then, "a thick, dark sky, lasting for some time, without either sun or rain, always becomes first fair, then foul," *i. e.* it changes to a fair clear sky, before it turns to rain. This the Rev. Mr. Clarke observed, who kept a register of the weather for thirty years, since put into Dr. Derham's hands by his grandson the learned Dr. S. Clarke: he says, he scarce ever knew it to fail; at least when the wind was in any of the easterly points; but Dr. Derham has observed the rule to hold good, be the wind where it will. And the cause is obvious. The atmosphere is replete with vapours, which, though sufficient to reflect and intercept the sun's rays from us, yet want density to descend; and while the vapours continue in the same state, the weather will do so too. Accordingly, such weather is generally attended with moderate warmth, and with little or no wind to disturb the vapours, and a heavy atmosphere to sustain them; the barometer being commonly high. But when the cold approaches, and, by condensing, drives the vapours into clouds or drops, then way is made for the sunbeams; till the same vapours, being by farther condensation formed into rain, fall down in drops.

2. "A change in the warmth of the weather is generally followed by a change of the wind." Thus, the northerly and southerly winds, commonly esteemed the causes of cold and warm weather, are really the effects of the cold or warmth of the atmosphere; of which Dr. Derham assures us he has had so many confirmations, that he makes no doubt of it. Thus, it is common to see a warm southerly wind suddenly changed to the north, by the fall of snow or hail; or to see the wind, in a cold frosty morning, north, when the sun has well warmed the earth and air, wheel towards the south; and again turn northerly or easterly in the cold evening.

3. "Most vegetables expand their flowers and down in sun-shiny weather; and towards the evening, and against rain, close them again; especially at the beginning of their flowering, when their seeds are tender and sensible." This is visible enough in the down of dandelion, and other downs; and eminently in the flowers of pimpernel; the opening and shutting of which, Gerard (Herb. lib. ii.) observes, are the countryman's *weather-wiser*, whereby he foretels the weather of the following day. The rule is, if the flowers be close that up, it

betokens rain, and foul weather: if they be spread abroad, fair weather. "*Est et alia (arbor in Tylis) similis, foliosior tamen, resque floris; quem noctu comprimens, aperire incipit solis exortu, moridie expandit. Incolae dormire eum dicunt.*" Plin. Nat. Hist. lib. xii. cap. 11. The stalk of trefoil, Lord Bacon observes, swells against rain, and grows more upright: and the like may be observed, though not so sensibly, in the stalks of most other plants. He adds, that in the stubble-fields there is found a small red flower, called by the country people *pimpernel*; which, opening in a morning, is a sure indication of a fine day. See *Sleep of Plants*.

That vegetables should be affected by the same causes that affect the weather, is very conceivable; if we consider them as so many hygrometers, and thermometers, consisting of an infinite number of tracheæ, or air-vessels; by which they have an immediate communication with the air, and partake of its moisture, heat, &c. These tracheæ are very visible in the leaf of the scabiose, vine, &c.

Hence it is, that all wood, even the hardest and most solid, swells in moist weather; the vapours easily insinuating into the pores thereof; especially of that which is lightest and driest. And hence we derive a very extraordinary use of wood, viz. for breaking rocks for millstones. The method at the quarries is this. Having cut a rock into a cylinder, they divide that into several less cylinders, by making holes at proper distances round the great one; the holes they fill with so many pieces of fallow wood, dried in an oven, which, in moist weather, becoming impregnated with the humid corpuscles of the air, swell; and, like wedges, break or cleave the rock into several fissions.

Predictions of the WEATHER from the barometer and moon. See *BAROMETER* and *moon*.

WEATHER, in sea-language, is used as an adjective, and applied by mariners to every thing lying to windward of a particular situation: thus, a ship is said to have the weather-gage of another, when she is farther to windward. Thus also, when a ship under sail presents either of her sides to the wind, it is then called the *weather-side* or *weather-board*; and all the rigging and furniture situated thereon are distinguished by the same epithet, as the *weather-boards*, the *weather-lifts*, the *weather-braces*, &c.

To WEATHER, in sea-language, is to sail to windward of some ship, bank, or head-land.

WEATHER-Cock, a moveable vane, in form of a cock, or other shape, placed on high, to be turned round according to the direction of the wind, and point out the quarter from whence it blows.

WEATHER-Glass. See *BAROMETER*.

WEATHERING, among sailors, signifies the doubling or sailing by a head-land or other place.

WEAVING, the art of working a web of cloth, silk, or other stuff, in a loom with a shuttle. For an idea of the manner in which this is performed, see *CLOTH*.

WEAVING-Loom, a machine for weaving cloth, silk, &c. by raising the threads of the warp in order to throw in the shoot, and strike it close. Of these there are various kinds, distinguished by the different sorts of cloths, stuffs, silks, &c. in which they are employed; and which are chiefly distinguished by the number and variety of the threads they raise in order to work the warp, either plain or in figures, by making more or less of the woof or shoot appear through the warp. In order to give a general idea of weaving, we shall here describe the parts of the common weaver's loom. See Plate 5, fig. 1. in which *e, f, e, f*, are the front posts, and *g, g*, the back posts of the loom; *l, l, l, m, m, m*, are the *lams* in their place at *Q*, or, as they are called in some parts of Scotland, the *biddles*, and in others the *flaves*. They are composed of strong threads,

stretched between two horizontal bars, an upper and a lower. The threads of one lam are so disposed as to pass between the upper threads of the warp, while they admit the lower threads to pass through loops or small holes in them, and the disposition of the threads of the other lam is such, that while they pass between the lower threads of the warp, they admit the upper threads to pass through the small holes just mentioned. The lams are suspended from the cross-bar or *lam-bearer* *HH*, by means of ropes *n, n*, passing from the upper bars of the *lams* over the pulleys at *EE*, and balanced by weights at the other ends. From the lower bar of each *lam* or *biddle* a rope passes to the *treadles* or moveable bars at *OO*; so that when a foot presses a treadle, the lam fastened to it sinks, while the other rises by means of the balancing weight suspended from the pulley at *E*. The workman then throws in the woof by means of the shuttle, and closes it by one or two strokes of the *lay* or *batten*, of which *WB, WB*, are called the *swords*, *CC* the *cap*, or in Scotland the upper *shell*, *DD* the *block* or under *shell*, and *PP* the *reed* or *comb* contained between these shells. *LL* is the bench on which the workmen sit; for the loom which our figure represents is constructed for weaving cloth of such a breadth as to require two workmen, who have their quills in a box *d* on the middle of the bench on which they sit. Between the workmen's bench and the *batten* or *lay* is the *breast-bar* *I, I*, a smooth square beam, in which there is an opening to let the web through as it is wove. From this opening the web *SS* passes to the *knee-roll* or *web-beam* *GG*, round which it is rolled by means of the spokes, visible in the figure, and kept from being unrolled by a wheel with teeth and clench, visible likewise in the figure. In some looms the web passes from the knee-roll to the wooden frame *X*, to be dried as it is wove. Opposite to the breast-bar, and on the other side of the *batten* or *lay*, is the *cane-roll* or *yarn-beam*, on which the warp is rolled when put into the loom, and from which it is gradually unrolled as the work proceeds. *TT* are bobbins filled with yarn of the warp to mend such threads of it as may be broke in the weaving; and *B, B, B*, are clues of the same kind of yarn with the borders of the warp, to mend such threads as may there be broken.

Fig. 2. represents the common shuttle with the vacuity in the middle, in which the quill with the woof is placed on a spindle or axis. As this shuttle is thrown with one hand in at one side of the warp, and received with the other hand at the other side, it is obvious, that when the web is of a breadth too great for a man to reach from one side of it to the other, two workmen must be employed and much time lost. To remedy this inconvenience, a new shuttle has, in this country, been lately brought into very general use, and called the *flying shuttle*, because it flies through the warp with wonderful rapidity on two steel rollers *RR* (fig. 3.) This shuttle is not thrown with the hand, but moved backwards and forwards by a very simple piece of machinery, of which fig. 4. will give the reader a sufficiently accurate conception. To each end of the *batten* or *lay* *L* is fastened a kind of open box *B, b*, with the bottom or horizontal side exactly on a level with the threads of the warp of the intended web. In each of these boxes is a vertical piece of wood *D, d*, of considerable thickness, called a *driver*. This driver is moved easily on an iron spindle or axis from one end of the box to the other by means of a slender rope *CCCC*, and a handle *H* is seen in the figure. When the weaver is to begin his work, he lays the shuttle on its rollers in the box *B* with the iron tip *T* (fig. 3.), touching, or almost touching, the driver *D* (fig. 4.) Then moving the handle *H*, with a sudden jerk, towards the box *b*, the driver *D* forces the shuttle with a rapid motion through the warp till it strikes *d*, which is impelled by the stroke to the further end of the box *b*. The two drivers *D* and *d* have

*Fig. 2.**Fig. 3.**Fig. 4.*

now changed their positions in their respective boxes; so that the driver which was at the front of its box before, is now at the farther end of it, and *vice versa*. Then by a sudden jerk of the hand towards B the shuttle is driven back till it strikes D; and thus is the work continued without the weaver having occasion ever to stretch his arms from one margin of the web to the other. That the shuttle may not, by the unsteadiness of the workman's hand, be driven zig-zag through the warp or out of the place in which it ought to move, the guiding or driving rope CCDD is made to pass through smooth holes or loops C, C, at the ends of the ropes EC, EC, suspended either from the cross-bar on the top of the loom or from the swords of the batten.

WEB, a sort of tissue or texture formed of threads interwoven with each other; some whereof are extended in length, and called the *warp*; others are drawn across, and called the *weft*.

WEDGE, one of the mechanical powers. See MECHANICS.

WEDNESDAY, the fourth day of the week, so called from a Saxon idol named *Woden*, supposed to be Mars, worshipped on this day.

WEDNESDAY, the first day of Lent, so called from the custom observed in the ancient Christian church of penitents expressing their humiliation at this time, by appearing in sack-cloth and ashes.

WEED, a common name for all rank and wild herbs, that grow of themselves, to the detriment of other useful herbs they grow among.

WEED, in the miner's language, denotes the degeneracy of a load or vein of fine metal into an useless marcasite.

WEEDS, also denote a peculiar habit, worn by the relicts of persons deceased, by way of mourning.

WEEK, in chronology, a division of time comprising seven days. See PLANETARY DAYS and SABBATH.

PASSION-WEEK, or the Holy WEEK, is the last week in Lent, wherein the church celebrates the mystery of our Saviour's death and passion.

WEEK OF WYCK, in geography, a parliament and port-town of Scotland, in the shire of Caithness. W. Long. 3. 2. N. Lat. 58. 30.

WEEKS *Ember*. See EMBER.

FEAST OF WEEKS. See PENTECOST.

WEEVEL, *Method of destroying*. See GRANARY.

WEEVER, in ichthyology. See TRACHINUS.

WEEVIL, in zoology, a species of curculio. See CURCULIO.

WEIGH, a weight of cheefe, wool, &c. containing 256 pounds avoirdupois. Of corn, the weigh contains 40 bushels; of barley or malt, six quarters. In some places, as Essex, the weight of cheefe is 300 pounds.

WEIGHING, the act of examining a body in the balance to find its weight.

WEIGHING *Anchor*, is the drawing it out of the ground it had been cast into, in order to set sail, or quit a port, road, or the like.

WEIGHT, in physics, a quality in natural bodies, whereby they tend downwards towards the centre of the earth. Or, weight may be defined in a less limited manner, to be a power inherent in all bodies whereby they tend to some common point, called the *centre of gravity*, or, to speak more accurately, to one another: and that with a greater or less velocity, as they are more or less dense, or as the medium they pass through is more or less rare. See MECHANICS.

WEIGHT, in commerce, denotes a body of a known weight

appointed to be put in the balance against other bodies whose weight is required.

The security of commerce depending, in a good measure, on the justness of weights, which are usually of lead, iron, or brass, most nations have taken care to prevent the falsification thereof, by stamping or marking them by proper officers, after being adjusted by some original standard. Thus, in England, the standard of weights is kept in the exchequer by a particular officer, called the *clerk of the market*.

Weights may be distinguished into ancient and modern.

I. ANCIENT WEIGHTS.

1. Those of the ancient Jews, reduced to the English troy weight, will stand as in the following table:

Shekel	lb.	oz.	dwt.	gr.
	0	0	9	2 $\frac{1}{2}$
60 Maneh	3	3	6	10 $\frac{1}{2}$
3000 50 Talent	113	10	1	10 $\frac{1}{2}$

2. Roman weights, reduced to English troy weight, will stand as in the following table:

Lentes	oz.	dwt.	gr.
	0	0	0 $\frac{1}{12}$
4 Siliquæ	0	0	3 $\frac{1}{2}$
12 3 Obolus	0	0	9 $\frac{1}{2}$
24 6 2 Scriptulum	0	0	18 $\frac{1}{2}$
72 18 6 3 Drachma	0	2	6 $\frac{1}{4}$
96 24 8 4 1 $\frac{1}{3}$ Sextula	0	3	0 $\frac{6}{7}$
144 36 12 6 2 1 $\frac{1}{2}$ Sicilius	0	4	13 $\frac{1}{2}$
192 48 16 8 2 $\frac{1}{2}$ 1 $\frac{1}{2}$ Duella	0	6	1 $\frac{1}{2}$
576 144 48 24 8 6 4 3 Uncia	0	18	5 $\frac{1}{2}$
6912 1728 576 288 96 72 48 36 12 Libra	10	18	13 $\frac{1}{2}$

The Roman ounce is the English avoirdupois ounce, which they divided into 7 denarii, as well as 8 drachmas.

3. Attic Weights.

Drachma	English Troy Weight.
	lb. oz. dwt. gr.
	0 0 2 16,9
100 Mina	1 1 10 20
6000 60 Talent	67 7 5 0

II. MODERN WEIGHTS.

1. *English Weights*.—Mr. Renardson, in a paper published in the Philosophical Transactions, has proved, that at first there was but one weight in England, and that this was the avoirdupois. Troy weight was introduced in the time of Henry VII.: at present, both the troy and avoirdupois weights are used in England. Troy weight seems to have derived its name from *Troyes*, a town in France, where a celebrated fair was kept. It is used for weighing gold, silver, jewels, silk, and all liquors. The avoirdupois is used for weighing other things.

TABLE of Troy Weight, as used by the Goldsmiths, &c. Apothecaries.

Grains.	Grains.
24 Penny-weight.	20 Scruple. 9
480 20 Ounce.	60 3 Dram. 5
5760 240 12 Pound.	480 24 8 Ounce. 3
	5760 288 96 12 Pound.

The troy pound in Scotland, which by statute is to be the same as the French pound, is commonly supposed equal to 15 ounces and three quarters troy English weight, or 7560 grains. But by a mean of the standards kept by the dean-of-guild of Edinburgh, it weighs $599\frac{1}{2}$ or 7600 grains.

TABLE of Avoirdupois Weight.

Drams.	
16 An ounce.	
256 16 A pound.	
7168 448 28 A quarter.	
28672 1792 112 4 A hundred.	
573440 35840 2240 80 20 A ton.	

The avoirdupois pound is equal to 7004 troy grains, the avoirdupois ounce to 437.75 grains; and it follows of consequence, that the troy pound is to the avoirdupois pound as 88 to 107 nearly; for as 88 to 107, so is 5760 to 7003.636: that the troy ounce is to the avoirdupois ounce as 80 to 73 nearly; for as 80 to 73, so is 480 to 438. An avoirdupois pound is equal to 1 lb. 2 oz. 11 dwts. 20 gr. troy: a troy ounce is equal to 1 oz. 1.35 dr. avoirdupois; an avoirdupois dram contains 27.34375 grains; 175 troy pounds are equal to 144 avoirdupois pounds.

The moneyers have a peculiar subdivision of the grain troy: thus,

The {	Grain Mite Droit Periot	} into {	20 Mites.
			24 Droits.
			20 Periot.
			24 Blanks.

The English weights are used in the United Provinces of America.

2. *French Weights.*—Different weights were formerly used in most of the different provinces of France: we believe that they have lately undergone several alterations. Be that as it may, a knowledge of the ancient weights of that country is of importance on account of the books in which they are used. The Paris pound contains 16 ounces, and is divided two ways.

Grains.	
24 Penny-weight.	
72 3 Gros.	
576 24 8 Ounce.	
4608 192 64 8 Marc.	
9216 384 128 16 2 Pound.	

Half-ounce.

2 Ounce.	
4 2 Half-quarter pound.	
8 4 2 Quarter-pound.	
16 8 4 2 Half-pound.	
32 16 8 4 2 Pound.	
3200 1600 800 400 200 100 Quintal.	

The weights of the first division are used to weigh gold, silver, and the richer commodities; and the weights of the second division for commodities of less value.

The Paris 2 marc, or pound weight, is equal to 7560 grains troy, and the Paris ounce equal to 472.5 grains troy.

lb. oz. dwt. gr.

The Paris pound = 1 3 15 0 troy

The Paris ounce = 0 0 19 16.5 troy.

A grain troy = 1.2186507 of a Paris grain.

But the pound was not the same throughout France. At Lyons, *c. gr.* the city pound was only 14 ounces; so that 100 Lyons pounds made only 86 Paris pounds. But beside the city pound, they had another at Lyons for silk, containing 15 ounces. At Toulouse, and throughout the Upper Languedoc, the pound was 13 ounces and a half of Paris weight. At Marseilles, and throughout Provence, the pound was 13½ ounces of Paris weight. At Rouen, beside the common Paris pound and marc, they had the weight of the vicomte; which was 16 ounces, a half, and five-sixths of the Paris weight. The weights enumerated under the two articles of English and French weights are the same that are used throughout the greatest part of Europe; only under somewhat different names, divisions, and proportions.

French weights are used in all the French American settlements.

3. *Dutch Weights.*—The weight used in Amsterdam, and all over Holland, is called *Troy weight*, and is exactly the same with that used at Brussels. The Dutch weights are as follows:

Deukens.	
2 Troyken.	
4 2 Vierling.	
16 8 4 As.	
512 256 128 32 Angle.	
10240 5120 2560 640 20 Ounce.	
81920 40960 20480 5120 160 8 Marc.	

The marc is equal, according to M. Tillet, to 4620 French grains.

The Amsterdam pound used in commerce is divided into 16 ounces, 32 loots, or 128 drachms. This pound contains 2 marcs troy, and ought therefore to weigh only 10240 as: but it weighs 10280; so that it is a little heavier than the troy pound of Amsterdam: 256 lb. of commerce are equal to 257 lb. troy of Holland. Two different pounds are used by apothecaries; the one containing 2 marcs, the other only 1½. The

first is called *arsenic* pound weight; it contains 16 ounces, the ounce 8 drachms, the drachm 8 scruples, the scruple 20 grains. The second is called the *apothecary's* pound; it is divided into 12 ounces, or 24 loots. Three *arsenic* pounds are equal to 4 apothecary's pounds.

The Dutch stone	=	8 commercial lb.
The Lifpund, or Ll.	=	15
The pound weight	=	100
The Schipppond, or Sch. lb.	=	300

4. *Spanish Weights*.—The marc of Castile, used for weighing gold and silver, is divided as follows:

Grains (gold weight).

1 $\frac{1}{4}$	Grain (silver weight).								
12	1 $\frac{1}{2}$	Tomine (gold weight).							
12 $\frac{1}{2}$	12	1 $\frac{1}{2}$	Tomine (silver weight).						
37 $\frac{1}{2}$	36	3 $\frac{1}{2}$	3	Adarme.					
75	72	64	6	2	Ochava.				
66	92 $\frac{4}{5}$	8	7 $\frac{1}{2}$	24 $\frac{1}{2}$	1 $\frac{1}{2}$	Castellano.			
600	576	50	48	16	8	6 $\frac{1}{2}$	Ounce.		
4800	4608	400	384	128	64	10	8	Marc.	

The marc, according to Tillet, is equal to 7 oz. 4 gros, 8 grains French, which is equal to 4785 $\frac{1}{2}$ as of Holland. One hundred marcs of Castile = about 92 $\frac{1}{2}$ marcs of Holland; 100 marcs of Holland = 107 marcs of Castile. Medicines are sold by the fame marc; but it is divided differently, containing 8 ounces, 64 drachms, 192 scruples, 584 obols, 1152 carateras, 4608 grains.

The Spanish commercial pound is divided into two marcs, called *marcs of Tego*, each of which is equal to the marc of Castile. This pound is divided into 16 ounces, 256 adarmes, 9216 grains.

5. *Weights of Portugal*.—The Lisbon marc for assaying silver consists of 12 deniers, and the denier of 24 grains. The marc of Portugal for weighing gold and silver is equal, according to Tillet, to 7 ounces, 3 $\frac{1}{2}$ gros, and 34 grains French, which makes 4776 $\frac{1}{2}$ as of Holland; so that it is exactly the same with the Lisbon pound. It is divided into 8 ounces, 64 outavas, 192 scruples, 4608 grains.

The pound consists of 2 marcs, 16 ounces, or 96 outavas. The arroba of 32 lb. the quintal of 4 arrobas, or 128 lb., 100 Oporto pounds make 87 $\frac{1}{2}$ pounds of commerce of Amsterdamm.

6. *Weights of Italy*.—*Genoa*. Two kinds of weights are used at Genoa, the *peso grosso* (heavy weight), and the *peso fottile* (light weight): the latter is used for weighing gold and silver, the former for other things. The pound of the *peso fottile* is equal, according to Tillet, to 1 marc, 2 ounces, 2 $\frac{1}{2}$ gros, 30 grains French. It is divided into 8 ounces, the ounce into 24 deniers, and the denier into 24 grains. The pound of the *peso grosso* is equal to 1 marc, 2 ounces, 3 gros, 5 grains, French. It is divided into 12 ounces:

The cantaro	=	100 lbs. peso grosso.
The rubbo	=	25 lbs.
The rotolo	=	1 $\frac{1}{2}$ lb.
100 lbs. peso grosso	=	64 $\frac{1}{2}$ lb. of commerce of Amsterdamm.
100 lbs. peso fottile	=	129 marcs troy of Holland.

Rome. The Roman pound consists of 12 ounces, the ounce of 24 deniers, the denier of 24 grains. The Roman pound, Vol. X.

according to Tillet, is equal to 1 marc, 3 ounces, $\frac{1}{2}$ gros, 14 grains, French.

Venice. The marc for weighing gold and silver contains 8 ounces, 32 quarti, 1152 carati, or 4608 grani. An hundred marcs of Venice = 971 marcs troy of Holland, 100 marcs of Holland = 103 of Venice. In Venice they also use a *peso grosso* and *peso fottile*. 100 lbs. peso grosso = 94 $\frac{1}{2}$ commercial lbs. of Amsterdamm. 100 lbs. peso fottile = 61 $\frac{1}{2}$ ditto.

7. *Swedish Weights*.—The marc for weighing gold and silver is equal to 16 loths, 64 quintuns, or 4384 as. The pound of 32 loths, used for weighing food, is equal, according to Tillet, to 1 marc, 5 ounces, 7 gros, 8 grains French, which makes 8848 $\frac{1}{2}$ as troy of Holland. This answers exactly to the weight of the different pounds, as fixed in Sweden, viz. 8848 as = the pound for weighing articles of food; 7821 $\frac{1}{2}$ as = marc used in the mines; 7450 $\frac{1}{2}$ as = marc used in towns and in the country; 7078 $\frac{1}{2}$ as = marc used for weighing iron; 7416 as = pound used in medicine.

The kippund = 400 lbs. for weighing food.

The centner = 120 lbs.

The wagg = 165 lbs.

The sten = 32 lbs.

The Swedith as = 1 as of Holland troy.

8. *German Weights*.—*Vienna*. The marc of Vienna for weighing gold and silver is divided into 16 loths, 64 quintals, or 256 deniers or pfenings; the loth into 4 quintals, or 16 pfenings. This marc, according to Tillet, is equal to 1 marc, 1 ounce, 1 gros, 16 grains, French, = 5831 as troy Holland. The pound of Vienna is divided into 2 marcs, or 4 viertings; the mark into 8 ounces, 16 loths, 64 quintals, or 266 pfenings.

Hamburg. The marc for assaying gold is divided into 24 carats; the carat into 12 grains. The marc for silver is divided into 16 loths, and the loth into 18 grains. These marcs consist each of 288 grains, and are therefore equal. This marc, used in Hamburg for gold and silver, is the marc of Cologne, which is equal, according to Tillet, to 7 ounces, 5 gros, 7 $\frac{1}{2}$ grains, French, = 4866 as troy of Holland. It is divided into 8 ounces, 16 loths, 64 quintuns, 256 pfenings, 4352 elches, or 65536 right pfenings thelle. The apothecary pound used in Hamburg, and almost all Germany, is divided into 12 ounces, 96 drachms, 288 scruples, or 5760 grains; an ounce is equal to 621 as of Holland. The pound of commerce is equal, according to Tillet, to 10085 as of Holland; for half a pound is equal to 7 ounces, 7 gros, 23 grains, French. This pound is divided into 16 ounces, 32 loths, 128 quintuns, or 512 pfenings.

9. *Russian Weights*.—The berckowitz = 400 lbs.

The poud = 40 lbs.

The potand is divided into 32 loths, or 96 folotnuks. One hundred Russian lbs. = 106 $\frac{1}{2}$ marcs, or 82 $\frac{1}{2}$ lbs. of Amsterdamm. One hundred lbs. of commerce of Amsterdamm = 120 $\frac{1}{2}$ lbs. of Russia.

10. *Weights used in the several parts of Asia, the East-Indies, China, Persia, &c.*—In Turkey, at Smyrna, &c. they use the batman, or battemant, containing 7 $\frac{1}{2}$ ocos; theocco contains 4 cheyks or pounds, each of which, according to Tillet, is equal to 1 marc 2 oz. 3 gros, 28 gr. French. The Turkish weights are divided as follows:

Cantaras	Barmans	Ocos.	Rotelos.	Cheiks.	Mefals.	Drachms.
1	=	7 $\frac{1}{2}$	=	44	=	100
						176
						1733 $\frac{1}{2}$
						17600
						1
						6
						13 $\frac{1}{2}$
						24
						1000
						2400
						1
						2
						266 $\frac{1}{2}$
						400
						1
						1 $\frac{1}{2}$
						117 $\frac{1}{2}$
						176
						1
						66 $\frac{1}{2}$
						100
						1
						1

At Aleppo there are three sorts of rottos; the first 720 drachms, making about 7 pounds English, and serving to

weigh cottons, galls, and other large commodities; the second is 680 drachms, used for all silks but white ones, which is weighed by the third rotto of 700 drachms. At Seyda the rotto is 600 drachms.

The other ports of the Levant not named here, use some of these weights, particularly the *occa* or *ocqua*, the *rottoli*, and *rotto*.

The Chinese weights are the piece for large commodities; it is divided into 100 *catis*, or *cattis*; though some say into 125; the *catt* into 16 *taels*, or *tales*; each *tal* equivalent to 1½ of an ounce English, or the weight of 1 *rial* and $\frac{1}{12}$, and containing 12 *mas*, or *males*, and each *mas* 10 *condrins*. So that the Chinese piece amounts to 137 pounds English *avoirdupois*, and the *catt* to 1 pound 8 ounces. The *picol* for silk containing 66 *catis* and $\frac{4}{5}$; the *bahar*, *bakaire*, or *barr*, containing 300 *catis*.

Tonquin has also the same weights, measures, &c. as China. Japan has only one weight, viz. the *catt*; which, however, is different from that of China, as containing 20 *taels*. At Surat, Agra, and throughout the states of the Great Mogul, they use the *man*, or *maund*, whereof they have two kinds; the king's *man*, or king's weight; and the *man* simply; the first used for the weighing of common provisions, containing 40 *feers*, or *ferres*; and each *feer* a just Paris pound. The common *man*, used in the weighing of merchandise, consists likewise of 40 *feers*, but each *feer* is only estimated at 12 Paris ounces, or $\frac{3}{4}$ of the other *feer*.

The *man* may be looked upon as the common weight of the East-Indies, though under some difference of name, or rather of pronunciation; it being called *mao* at Cambaya, and in other places *mein*, and *maun*. The *feer* is properly the Indian pound, and of universal use; the like may be said of the *bahar*, *tal*, and *catt*, above mentioned.

The weights of Siam are the piece, containing two *thans* or *cattis*; but the Siamese *catt* is only half the Japanese, the latter containing 20 *taels*, and the former only 10; though some make the Chinese *catt* only 16 *taels*, and the Siamese 8. The *tael* contains 4 *baats* or *ticals*, each about a Paris ounce; the *baat* 4 *selings* or *mayons*; the *mayon* 2 *foangs*; the *foang* 4 *payes*; the *paye* 2 *clams*; the *lompaye* half a *foang*.

It is to be observed, that these are the names of their coins as well as weights; silver and gold being commodities there sold, as other things, by their weights.

In the *ile* of Java, and particularly at Bantam, they use the *gantan*, which amounts to near 3 Dutch pounds. In *Golconda*, at *Visapour*, and *Goa*, they have the *furatelle*, containing 1 pound 14 ounces English; the *mangalis*, or *mangelin*, for weighing diamonds and precious stones, weighing at *Goa* 5 grains, at *Golconda*, &c. 5½ grains. They have also the *rotolo*, containing 144 ounces English; the *metrical*, containing the sixth part of an ounce; the *wall* for *piastres* and *ducats*, containing the 73d part of a *rial*.

In *Perfia* they use two kinds of *batmans* or *mans*; the one called *catt* or *cheray* which is the king's weight, and the other *batman* of *Tauris*. The first weighs 13 pounds 10 ounces English; the second 6½ pounds. Its divisions are the *ratel*, or a 16th; the *derhem*, or *drachm*, which is the 50th; the *mechal*, which is half the *derhem*; the *dung*, which is the sixth part of the *mechal*, being equivalent to 6 carat grains; and, lastly, the grain, which is the fourth part of the *dung*. They have also the *yakie*, which exceeds a little our ounce; the *fahcheray*, equal to the 1170th part of the *derhem*; and the *to-man*, used to weigh out large payments of money without selling; its weight is that of 50 *abafis*.

11. *Weights at Cairo in Egypt*.—Almost every kind of goods has its own weight; these are regulated by the *cantaren* or principal weight.

	Rotels.
The ordinary cantaren, or hundred weight, weighs	100
The cantaren of quicksilver and tin	102
coffee, wine, and iron	105
ivory	109
almonds and other fruits	115
woods for dyeing	120
arfenic and other drugs	125
minium and cinnabar	139
gum-arabic, aloes, and other aromatics	133

The *rotel* or *rotoli* is nearly equal to the pound of *Marseilles*; 108 lbs. of *Marseilles* are equal to 110 *rotels*. The *Marseilles* pound consists of 13 ounces of Paris; so that 100 lbs. of *Marseilles* are equal to 81 lbs. Paris, and 100 lbs. Paris = 123 lbs. of *Marseilles*.

We shall subjoin here Mr. Ferguson's table for comparing the English *avoirdupois* pound with foreign pounds:—

London pound	1,0000	Hamburg	1,086½
Antwerp	1,04	Lisbon	1,135
Amsterdam	1,1111	Leghorn	0,75
Abeville	1,0989	Norimberg	1,136½
Ancona	0,78	Naples	0,71
Avignon	0,8928	Paris	1,1235
Bourdeaux	1,0689	Prague	1,2048
Bologna	0,8	Placentia	0,72
Bruges	1,0204	Rochelle	0,8928
Calabria	0,73	Rome	0,7874
Calais	0,9345	Rouen	1,1089
Dieppe	1,0989	Seville	0,9259
Dantzic	0,862	Toulouse	0,8928
Ferrara	0,75	Turin	0,82
Flanders	0,9433	Venice	1,06
Geneva	1,07	Vienna	1,23
Genoa, gross	0,7		

In order to show the proportion of the several weights used throughout Europe, we shall add a reduction of them to one standard, viz. the London pound.

The 100 lb. of England, Scotland, and Ireland, are equal to

lb. oz.	
91	8 of Amsterdam, Paris, &c.
96	8 of Antwerp or Brabant.
88	0 of Rouen, the viscounty weight.
106	0 of Lyons, the city weight.
90	9 of Rochelle.
107	11 of Toulouse and Upper Languedoc.
113	0 of Marseilles or Provence.
81	7 of Geneva.
93	5 of Hamburg.
89	7 of Francfort, &c.
96	1 of Leipfic, &c.
137	4 of Genoa.
132	11 of Leghorn.
153	11 of Milan.
152	0 of Venice.
154	10 of Naples.
97	0 of Seville, Cadiz, &c.
104	13 of Portugal.
96	5 of Leige.
112	$\frac{3}{4}$ of Russia.
107	$\frac{3}{4}$ of Sweden.
89	$\frac{3}{4}$ of Denmark.

A curious weighing machine was some time ago invented by M. Hanin of Paris, whereby the weights of the principal countries in Europe, and the relative proportions they bear to each

other, are shown at one view. For this he received a bounty of 20 guineas from the Society instituted at London for the Encouragement of Arts, Manufactures, and Commerce. We shall insert a description and figure of this ingenious machine.

In Pl. 3. fig. 1. represents the back of the machine, which being supported by the ring A, and a weight hung to the hook B, the spring C, C, C, made fast by strong screws at *g*, is drawn downwards; and the bar D, having a rack thereon at *e*, turns the pinion *f*, in proportion to the weight of the body hanging thereto. Fig. 2. shows the face of the machine, on which are a number of concentric circles, and the weights of several countries of Europe engraved thereon, as expressed by the words on a line with them. In the centre of this face is a ring fixed to the small plate, turned by the pinion *f*, shown at fig. 1. From this ring a hand projects, which, by the turning of the pinion, points to such part of the circle as is marked with the weight, hung to the hook B; and thereby shows what weight of any of the countries mentioned, is equal to the pounds troy of London, which are engraved on the outer circle, or to the pounds avoirdupois, which are engraved on the second circle, and so of the rest. A slider moves on the hand, which may be brought to any of the circles at pleasure, in order to point out the relative weight with greater precision.

In the same plate we have also given, at the request of a correspondent, the *quadrant scale*, which is an invention for weighing goods without weights. It surpasses the STEELYARD in weighing to a greater nicety; being less liable to be out of order, and having no trouble of shifting the weight; as, directly on the goods being put into the scale, the index shews the weight of them. The sizes are from 7 lb. to 150 lb. but they may be made to any size; and so as to weigh to 2 oz. very exactly. In the plate, A shows the frame made of brass. B a strong spring screwed to the frame near the nut F, to which hangs the scale C by the hook D, which being drawn downwards by the goods in the scale, raises the index E. F a nut to regulate the index in case of variation. G the hook to hang it up by.

Many attempts have been made to introduce an uniformity of weights and measures into the commercial world; but hitherto they have all failed. The accomplishment of such an undertaking would be of infinite advantage to mankind, and certainly claims the most serious attention of those who by their situation can alone bring it about. The undertaking is indeed difficult, but surely not impossible. Something of this kind has lately been attempted in France; and if it succeed, as the method is simple, and exceedingly well adapted for calculation, it surely deserves to be imitated.

WEIGHT of Air. See PNEUMATICS.

Regulation of WEIGHTS and MEASURES, is a branch of the king's prerogative. See PREROGATIVE and MEASURE. As weight and measure are things in their nature arbitrary and uncertain, it is therefore expedient that they be reduced to some fixed rule or standard: which standard it is impossible to fix by any written law or oral proclamation; for no man can, by words only, give another an adequate idea of a foot rule, or a pound weight. It is therefore necessary to have recourse to some visible, palpable, material standard; by forming a comparison with which all weights and measures may be reduced to one uniform size; and the prerogative of fixing this standard, our ancient law vested in the crown, as in Normandy it belonged to the duke. This standard was originally kept at Winchester: and we find in the laws of King Edgar, near a century before the conquest, an injunction that the one measure, which was kept at Winchester, should be observed throughout the realm. Most nations have regulated the standard of measures of length by comparison with the parts of the human body; as the palm, the hand, the span, the

foot, the cubit, the ell (*ulna* or arm), the pace, and the fathom. But as these are of different dimensions in men of different proportions, our ancient historians inform us, that a new standard of longitudinal measure was ascertained by King Henry the First; who commanded that the *ulna*, or ancient ell, which answers to the modern yard, should be made of the exact length of his own arm. And one standard of measure of length being gained, all others are easily derived from thence; those of greater length by multiplying, those of less by dividing, that original standard. Thus, by the statute called *compositio ulnarum et peticarum*, five yards and an half make a perch; and the yard is subdivided into three feet, and each foot into twelve inches; which inches will be each of the length of three grains of barley. Superficial measures are derived by squaring those of length; and measures of capacity by cubing them. The standard of weights was originally taken from corns of wheat, whence the lowest denomination of weights we have is still called a *grain*: 32 of which are directed, by the statute called *compositio mensurarum*, to compose a penny-weight, whereof 20 make an ounce, 12 ounces a pound, and so upwards. And upon these principles the first standards were made; which, being originally so fixed by the crown, their subsequent regulations have been generally made by the king in parliament. Thus, under King Richard I. in his parliament holden at Westminster, A.D. 1197, it was ordained that there should be only one weight and one measure throughout the kingdom, and that the custody of the assize, or standard of weights and measures, should be committed to certain persons in every city and borough; from whence the ancient office of the king's aulnager seems to have been derived, whose duty it was, for a certain fee, to measure all cloths made for sale, till the office was abolished by the statute 11th and 12th William III. c. 20. In King John's time this ordinance of King Richard was frequently dispensed with for money; which occasioned a provision to be made for enforcing it, in the great charters of King John and his son. These original standards were called *pondus regis*, and *mensura domini regis*, and are directed by a variety of subsequent statutes to be kept in the exchequer chamber, by an officer called the *clerk of the market*, except the wine gallon, which is committed to the city of London, and kept in Guildhall.

By the articles of union, the English standards are established over all Great Britain; but the force of custom is so strong, that the Scottish standards are still universally retained for many purposes. Likewise a variety of local weights and measures are used in particular places of both countries, which differ from the general standards of either.

WELD, or WOLD, in botany. See RESEA.

WELDING-HEAT, in smithery, a degree of heat given to iron, &c. sufficient to make the surfaces of two pieces incorporate upon being beaten together with a hammer.

WANMANNIA, in botany: a genus of plants of the class *estrandia*, order *monogynia*, and arranged in the natural classification with those plants the order of which is doubtful. The calyx is four-leaved, the corolla has four petals, and the capsule is bilocular and birofrated. There are four species, none of which are natives of Britain.

WELL, a hole under ground, usually of a cylindrical figure, and walled with stone and mortar: its use is to collect the water of the strata around it.

WELL, an apartment formed in the middle of a ship's hold to inclose the pumps, from the bottom to the lower deck. It is used as a barrier to preserve those machines from being damaged by the friction or compression of the materials contained in the hold, and particularly to prevent the entrance of ballast, &c. by which the tubes would presently be choked,

and the pumps rendered incapable of service. By means of this inclosure, the artificers may likewise more readily descend into the hold, in order to examine the state of the pumps, and repair them as occasion requires.

Well-room of a boat, the place in the bottom where the water lies, between the ceiling and the platform of the stern-fluets, whence it is thrown out into the sea with a scoop.

Burning-Well. See *BURNING-SPRINGS*.

Well of a Fishing-vessel, an apartment in the middle of the hold, which is entirely detached from the rest, being lined with lead on every side, and having the bottom thereof penetrated with a competent number of small holes, passing also through the ship's floor; so that the salt-water running into the well is always kept as fresh as that in the sea, and yet prevented from communicating itself to the other parts of the hold.

Well-hole, in building, is the hole left in a floor for the stairs to come up through.

WELLS, a city of Somersetshire, and see of a bishop; the bishop of Bath being also that of Wells.—It is supposed to take its name from the many springs and wells that are near it. It is not very large; but is adorned with handsome buildings, both public and private. Its cathedral is a very beautiful structure, adorned with images and carved stonework. The bishop's palace joins to the cathedral; and on the other side are the houses for the prebendaries. In the market-place is a fine market-house, supported by pillars. It is governed by a mayor, and sends two members to parliament. The chief manufacture is knit hosiery. W. Long. 2. 37. N. Lat. 51. 12.

WEN, a tumor or excrescence arising on different parts of the body, and containing a cystus or bag filled with some peculiar kind of matter. See *Nævus*.

WEREGILD, the price of *homicide*; paid partly to the king for the loss of a subject, partly to the lord whose vassal he was, and partly to the next of kin of the person slain.

WERST, *WURST*, or *Verst*, a Russian measure equal to 3500 English feet. A degree of a great circle of the earth contains about 104 wersts and a half.

WERTURIAN or *URALIAN Mountains*, a famous chain of mountains forming part of the boundary of Asia. It begins distinctly (for it may be traced interruptedly farther south) near the town of Kungur, in the government of Kasan, in lat. 57. 20.; runs north, and ends opposite to the Waygatz strait, and rises again in the ile of *Neva Zemlja*. The Russians also call this range *Semennoi Point*, or, *the girdle of the world*; from a supposition that it encircled the universe. These were the *Kipchak montes*: *Pars mundi damnata a natura rerum, et densa mense caligine*; of which only the southern part was known to the ancients, and that so little as to give rise to numberless fables. Beyond these were placed the happy *Hyperborei*, a fiction most beautifully related by Pomponius Mela. Moderns have not been behindhand in exaggerating several circumstances relative to these noted hills. Ytbrand Ides, who crossed them in his embassy to China, asserts that they are 5000 toises or fathoms high; others, that they are covered with eternal snow. The last may be true in their more northern parts; but in the usual passages over them, they are free from it three or four months.

The heights of part of this chain have been taken by M. l'abbé d'Auteroche; who, with many assurances of his accuracy, says, that the height of the mountain Kyria near Solikamskaia, in latitude 63°, does not exceed 471 toises from the level of the sea, or 286 from the ground on which it stands. But, according to M. Gmelin, the mountain Pouda is much higher, being 752 toises above the sea. From Peterburg to this chain is a vast plain, mixed with certain

elevations or platforms, like islands in the midst of an ocean. The eastern side descends gradually to a great distance into the wooded and morassy Siberia, which forms an immense inclined plain to the Icy Sea. This is evident from all the great rivers taking their rise on that side, some at the amazing distance of latitude 46°; and, after a course of above 27 degrees, falling into the Frozen Ocean, in latitude 73. 30. The Yaik alone; which rises near the southern part of the eastern side, takes a southern direction, and drops into the Caspian Sea. The Dvina, the Pezora, and a few other rivers in European Russia, shew the inclined plane of that part. All of them run to the Northern Sea; but their course is comparatively short. Another inclination directs the Dnieper and the Don into the Euxine, and the vast Volga into the Caspian Sea.

WESLEY (JOHN), one of the most extraordinary characters that ever existed, whether we consider him as a various and voluminous writer, a zealous and indefatigable preacher, or the founder of the most numerous sect in the christian world, was the son of the Rev. Samuel Wesley, rector of Epworth, in the ile of Axholme, in Lincolnshire, and was born in that village in the year 1703.

In the year 1713 he was entered a scholar at the Charter-house in London, where he continued seven years, under the tuition of the celebrated Dr. Walker, and of the Rev. Andrew Tooke, author of "The Pantheon." Being elected to Lincoln College, Oxford, he became a fellow of that college about the year 1725, took the degree of master of arts in 1726, and was joint tutor with the Rev. Dr. Hutchins, the rector: He discovered, very early, an elegant turn for poetry; some of his gayer poetical effusions are proofs of a lively fancy and a fine classical taste; and some translations from the Latin poets, while at college, are allowed to have great merit. He had early a strong impression, like Count Zinzendorf, of his designation to some extraordinary work. This impression received additional force from some domestic incidents; all which his active fancy turned to his own account. His wonderful preservation from a fire when a child, naturally tended to cherish the idea of his being designed by Providence to accomplish some purpose or other, that was out of the ordinary course of human events.

The reading of the writing of Mr. William Law, the celebrated author of "Christian Perfection," and of "A Serious Address to the Christian World," contributed, moreover, to lead Mr. John Wesley, and his brother Charles, with a few of their young fellow-students, into a more than common strictness of religious life. They received the sacrament of the Lord's Supper every week; observed all the fasts of the church; visited the prisons; rose at four in the morning; and refrained from all amusements. From the exact method in which they disposed of every hour, they acquired the appellation of Methodists, by which their followers have been ever since distinguished.

The boundaries of this island were soon deemed by Mr. Wesley too confined for a zeal which displayed the piety of an apostle, and of an intrepidity to which few missionaries had been superior. In 1735 he embarked for Georgia, one of our colonies, which was, at that time, in a state of political infancy; and the great object of this voyage was to preach the gospel to the Indian nations in the vicinity of that province. He returned to England in 1737. Of his spiritual labours, both in this country and in America, he himself has given a very copious account, in a series of "Journals," printed at different periods. These Journals drew our laborious preacher into a controversy with Dr. George Lavington, bishop of Exeter, and Dr. William Warburton, bishop of Gloucester.

On his return from Georgia, Mr. Wesley paid a visit to

Count Zinzendorf, the celebrated founder of the sect of Moravians, or Herrnhuters, at Herrnuth, in Upper Lusatia. In the following year he appeared again in England, and with his brother Charles, at the head of the Methodists. He preached his first field sermon at Britol, on the 2d of April, 1738, from which time his disciples continued to increase. In 1741 a serious altercation took place between him and Mr. Whitefield. In 1744, attempting to preach at an inn at Taunton, he was regularly silenced by the magistrates. Although he chiefly resided, for the remainder of his life, in the metropolis, he occasionally travelled through every part of Great Britain and Ireland, establishing congregations in each kingdom. In 1750 he married a lady, from whom he was afterward separated. By this lady, who died in 1781, he had no children.

It has been justly observed of Mr. Wesley, that his labours were principally devoted to those who had no instructor; to the highways and hedges; to the miners in Cornwall, and the colliers in Kinwood. These unhappy creatures married and buried among themselves, and often committed murders with impunity before the Methodists sprung up. By the humane and active endeavours of Mr. Wesley and his brother Charles, a sense of decency, morals, and religion, was introduced into the lowest classes of mankind; the ignorant were instructed, the wretched relieved, and the abandoned reclaimed. His personal influence was greater perhaps than that of any other private gentleman in any country. He died March 2, 1791, aged 88, having preached the Wednesday before at Leatherhead in Surrey.—His works, as already observed, are very voluminous, and consist of various subjects, Theology, History, Biography, Philosophy, Medicine, &c.

WEST (GILBERT), son of the reverend Dr. West and of a sister of Sir Richard Temple, afterwards Lord Cobham, was educated at Eton and at Oxford, with a view to the church; but obtaining from his uncle a commission either in a regiment of dragoons or dragon guards, entered into the army, where he continued till his appointment into the office of Lord Townshend, secretary of state, with whom he attended the king to Hanover. He was nominated clerk-extraordinary of the privy-council in May 1729; soon after which he married, and settled at Wickham in Kent, where he devoted himself to learning, and to piety. For his "Observations on the Resurrection," which appeared in 1747, he received from Oxford, by diploma, the degree of LL.D. March 30, 1748. In 1749 first appeared his translation of "Pindar's Odes." He was very often visited by Lyttelton and Pitt. His income was not large; and his friends endeavoured, but without success, to obtain an augmentation. In time, however, his revenue was improved; he lived to have one of the lucrative clerkships of the privy-council in 1752; and Mr. Pitt at last had it in his power to make him treasurer of Chelsea Hospital. In 1755 he lost his only son, and died himself the year following, on the 26th of March.

WEST, one of the cardinal points of the horizon, diametrically opposite to the east; and strictly defined the intersection of the prime vertical with the horizon on that side the sun lies in.

WESTMINSTER, a city which forms the west part of the capital of Britain, but has a government distinct from the rest. This city had its name from the situation of its abbey, anciently called a *minster*, in respect of that of St. Paul. That part properly called the city of Westminster, comprehending the parishes of St. John and St. Margaret, was once an island formed by the Thames, called *Thorney island*, from the thorns with which it was over-run; and the abbey that stood in it, Thorney-abbey. The liberties of Westminster contain the several parishes of St. Martin in the Fields, St.

James's, St. Anne, St. Paul Covent-garden, St. Mary le Strand, St. Clement Danes, St. George Hanover Square, and the precinct of the Savoy. The government, both of the city and liberties, is under the jurisdiction of the dean and chapter of Westminster, in civil as well as ecclesiastical affairs; and their authority extends to the precinct of St. Martin le Grand, by Newgate-street, and in some towns of Essex, that are exempted from the jurisdiction of the bishop of London and the archbishop of Canterbury; but the management of the civil part has, ever since the reformation, been in the hands of laymen, elected from time to time, and confirmed by the dean and chapter. The chief of these laymen are the high-steward, the deputy-steward, and the high-bailiff, who hold their offices for life. There are also sixteen burgesses and their assistants, out of which are elected two head-burgesses, one for the city, and the other for the liberties. Another officer is the high-constable, who has all the other constables under his direction.

WESTMORELAND, a county of England, bounded on the north and north-west by Cumberland; on the south and south-east by Yorkshire; and on the south and south-west by Lancashire. Its extent from north-east to south, is 40 miles, and its breadth from the east projection to that in the west, 42. It is generally divided into the baronies of Kendal and Westmoreland; the former is very mountainous, but the latter is a large champaign country. These are the only principal divisions of this county, which contains eight market-towns and twenty-six parishes. It lies partly in the diocese of Chester, and partly in that of Carlisle. The earl of Thanet is hereditary sheriff of the county, which sends only four members to parliament. The air is clear, sharp, and salubrious, the natives being seldom troubled with diseases, and generally living to old age. The soil is various; that on the mountains is very barren, while that in the valleys is fertile, producing good corn and grass, especially in the meadows near the rivers. In the hilly parts on the western borders it is generally believed there are vast quantities of copper ore, and veins of gold; some mines of copper are worked, but most of the ore lies so deep that it will not answer the expence. This county yields the finest slate; and abundance of excellent hams are cured here. The principal rivers are, the Eden, the Lune, and the Ken. It has also several fine lakes, the principal of which is Winander Mere, or Windermere-water. In the forest of Martindale, to the south of Ulls-water, the breed of red deer still exists in a wild state.—Appleby is the county town.

WESTPHALIA, a duchy of Germany, bounded to the east by the bishopric of Paderborn, and the territories of Waldeck and Hesse; to the south by the counties of Witgenstein and Nauff, and the duchy of Berg; to the north by the bishopric of Munster and the county of Lippe. It is about 40 miles in length and 30 in breadth. The lower part of it is very fruitful, yielding plenty of corn and cattle, and some salt-springs. The higher affords iron-ore, calamine, lead, copper, some silver and gold, fine woods, cattle, game, fish, with a little corn. The rivers, that either pass through the duchy or along its borders, are the Rahr, the Lenne, the Bigge, the Dimel, and the Lippe. There are twenty-eight towns in it, besides boroughs and cloisters. The provincial diets are held at Arenberg. In the year 1180, the Emperor Fred. I. made a donation of this duchy to the archbishopric of Cologne, which was confirmed by succeeding emperors; and in 1638, the last duke of Arenberg ceded to it also the county of Arenberg. The duchy is governed at present by a bailiff, under the archbishop, and is divided into the Hellwege, the Haartfrank, and the Surland; or otherwise into the Ruden, the Werl, the Bilstein, and the Brilon quarters.

WESTPHALIA, one of the circles of Germany: anciently the people inhabiting between the Wefer and the Rhine, were called *Westphalians*; and hence that tract got the name of *Westphalia*: but the circle of that name is of a larger extent, being furrounded by the circle of Burgundy, or the Austrian Netherlands, the United Provinces, and the North Sea, with the circles of the Upper and Lower Rhine, and comprising a great many different states.

The fummoning princes and directors of the circle of Westphalia, are the bishops of Munster, alternately with the electors of Brandenburg and Palatine, as dukes of Cleve and Juliers. The archives belonging to it were before the present war (1797) kept at Dusseldorf. Its quota of men and money is somewhat more than the ninth part of the whole sum granted by the empire. With respect to religion, it is partly Protestant and partly Catholic; but the Protestants predominate, and are, at least the greater part of them, Calvinists. The air of this country is not reckoned very wholesome, and towards the north is extremely cold in winter. The soil in general is marshy and barren; yet there is some good corn and pasture land: but the fruit is chiefly used to feed hogs; and hence it is that their bacon and hams are so much valued and admired.

WET COUGH, *coming heap*, a term used by the maltsters for one of the principal articles of malt-making. See **BREWING**.

WETSTEIN (John James), a very learned German divine, born at Basil in 1693. On his admission to the ministry, he maintained a thesis *De variis Novi Testamenti Lectionibus*; in which he showed that the great variety of readings of the New Testament afford no argument against the authenticity of the text. He had made these various readings the object of his attention; and travelled into foreign countries to examine all the MSS. he could come at. In 1730 he published *Prolegomena ad Novi Testamenti Græci editionem accuratissimam*, &c. Some divines, dreading his unsettling the present text, procured a decree of the senate of Basil against his undertaking, and even got him prohibited from officiating in the ministry; on which he went to Amsterdam, where the remonstrants named him to succeed the famous Le Clerc, then superannuated, as professor of philosophy and history. At last he published his edition of the New Testament, in two vols. folio, 1752; in which he left the text as he found it, placing the various readings, with a critical commentary, underneath; subjoining two epistles of Clemens Romanus, till then unknown to the learned, but discovered by him in a Syriac MS. of the New Testament. He also published some small works; and is said to have been not only an universal scholar, but to have abounded in good and amiable qualities. He died at Amsterdam in 1754.

WETERAVIA, the southern division of the Landgrate of Hesse in Germany, lying along the northern bank of the river Maine, comprehending the counties of Hanau and Nassau.

WEXFORD, a county of Ireland, in the province of Munster, 38 miles in length, and 24 in breadth; bounded on the north by Wicklow, on the east by St. George's Channel, on the south by the Atlantic Ocean, on the west by Waterford and Kilkenny, and on the north by Catherlough. It contains 709 parishes, and sends eighteen members to parliament. It is a fruitful country in corn and grass; and the principal town is of the same name.

WEXFORD, a sea-port of Ireland, capital of a county of the same name. It was once reckoned the chief city in Ireland, being the first colony of the English, and is still a large handsome town, with a very commodious harbour at the mouth of the river Slana, on a bay of St. George's Channel, 63 miles south of Dublin. W. Long. 6 3. N. Lat. 52. 18.

WHALE, in ichthyology. See **BALÆNA** and **PHYSETER**.

WHALE, in astronomy, one of the constellations. See **ASTRONOMY**.

WHALE-BONE. See **BALÆNA**.

WHALE-FISHERY. See **FISHERY**.

WHARF, a space on the banks of a haven, creek, or hithe, provided for the convenient loading and unloading of vessels.

WHARTON (Philip duke of), a nobleman of the most brilliant parts, but of the most whimsical, extravagant, and inconsistent turn of mind, was educated by his father's express order at home. He very early married a young lady, the daughter of Major-general Holmes, which disappointed his father's views of disposing of him in such a marriage as would have been a considerable addition to the fortune and grandeur of his illustrious family; yet that amiable lady deserved infinitely more felicity than the met with by this alliance. This precipitate marriage is thought to have hastened the death of his father; after which the duke, being free from paternal restraints, plunged into all manner of excesses.

In the beginning of the year 1716 he began his travels; and as he was designed to be instructed in the strictest Whig principles, Geneva was thought a proper place for his residence: He first passed through Holland, and visited several courts of Germany; and being arrived at Geneva, conceived such a disgust against his governor, that he left him, and set out post for Lyons, where he wrote a letter to the chevalier de St. George, who then resided at Avignon, and presented him a very fine stout horse; which the chevalier no sooner received than he sent a man of quality to him, who took him privately to his court, where he was entertained with the greatest marks of esteem, and had the title of duke of Northumberland conferred upon him. He, however, remained there but one day, and then returned post to Lyons, whence he set out for Paris. He likewise paid a visit to the consort of James II. who then resided at St. Germain, to whom he also paid his court. During his stay at Paris, his winning address and abilities gained him the esteem and admiration of all the British subjects of rank of both parties.

About the latter end of December, 1716, he arrived in England, whence he soon after set out for Ireland, where, though under age, he was allowed the honour to take his seat in the house of peers, and immediately distinguished himself, notwithstanding his former conduct, as a violent partizan for the ministry; in consequence of which zeal the king created him a duke. He no sooner came of age than he was introduced to the house of lords in England with the same blaze of reputation. In a little time he opposed the court, and appeared one of the most vigorous in defence of the Bishop of Rochester; and soon after printed his thoughts twice a-week, in a paper called the *True Briton*, several thousands of which were dispersed weekly.

The duke's boundless profusion had by this time so burdened his estate, that by a decree of Chancery it was vested in the hands of trustees for the payment of his debts, allowing him a provision of 12000*l.* per annum for his subsistence. This being not sufficient to support his title with suitable dignity, he went abroad and shone to great advantage, with respect to his personal character, at the imperial court. From thence he made a tour to Spain: the English minister was alarmed at his arrival, fearing that his grace was received in the character of an ambassador: upon which the duke received a summons under the privy-seal to return home; but instead of obeying it, he endeavoured to inflame the Spanish court against that of Great Britain, for exercising an act of power, as he calls it, within the jurisdiction of his catholic majesty. He then acted openly in the service of the Pretender, and was received at his court with the greatest marks of favour.

While his grace was thus employed, his neglected duties

died in England on the 14th of April, 1726, without issue. Soon after the duke fell violently in love with M. Oberne, one of the maids of honour to the queen of Spain, the daughter of an Irish colonel, whose fortune chiefly consisted in her personal accomplishments. All his friends, and particularly the queen of Spain, opposed the match; but he falling into a lingering fever, occasioned by his disappointment, the queen gave her consent, and they were soon after married. He then spent some time at Rome, where he accepted of a blue garter, assumed the title of duke of Northumberland, and for a while enjoyed the confidence of the exiled prince. But not always keeping within the bounds of Italian gravity, it became necessary for him to remove from hence; when, going by sea to Barcelona, he wrote a letter to the King of Spain, acquainting him that he would assist at the siege of Gibraltar as a volunteer. Soon after he wrote to the Chevalier de St. George, expressing a desire to visit his court; but the chevalier advised him to draw near to England.

The duke seemed resolved to follow his advice; and setting out with his duchess, arrived in Paris in May 1728, whence he soon after proceeded to Rouen, where he took up his residence; and was so far from making any concession to the government of England, that he did not give himself the least trouble about his estate, or any other concern there; though, on his arrival at Rouen, he had only about 600*l.* in his possession, and a bill of indictment was preferred against him in England for high-treason. Soon after the chevalier sent him 2000*l.* which he squandered away in a course of extravagance; when, to save the charges of travelling by land, he went from Orleans to Nantz by water, and staid there till he got a remittance from Paris, which was squandered almost as soon as received. At Nantz he was joined by his ragged servants, and from hence took shipping with them for Bilbao, when the queen of Spain took the duchess to attend her person. About the beginning of the year 1731, the duke, who commanded a regiment, was at Lerida, but declined so fast that he could not move without assistance; yet when free from pain did not lose his gaiety. He, however, received benefit from some mineral waters in Catalonia; but soon after relapsed at a small village, where he was utterly destitute of all the necessaries of life, till some charitable fathers of a Bernardine convent removed him to their house, and gave him all the relief in their power. Under their hospitable roof he languished a week, and then died, without one friend or acquaintance to close his eyes; and his funeral was performed in the same manner in which the fathers inter those of their own fraternity.

Thus died Philip duke of Wharton, "who, like Buckingham and Rochester (says Mr. Walpole), comforted all the grave and dull, by throwing away the brightest profusion of parts on witty fooleries, debaucheries, and scrapes, which mix graces with a great character, but never can compose one.

"With attachment to no party, though with talents to govern any party, this lively man changed the free air of Westminster for the gloom of the Eburian, the prospect of King George's garter for the Pretender's; and with indifference to all religion, the frolic lord who had writ the ballad on the archbishop of Canterbury, died in the habit of a capuchin. It is difficult to give an account of the works of a man whose library was a tavern, and women of pleasure his muses. A thousand follies of his imagination may have been lost. There are only two volumes in 8vo. called his *Life and Writings*. These contain nothing of the latter, but 74 numbers of the *True Briton*, and his speech in defence of the bishop of Rochester. His other works are the ballads above mentioned; the *Drinking Match* at Eden-hall, in imitation

of the Chevy-Chace, printed in a miscellany called *Wartoniana*; and a parody of a song sung at the opera-house by Mrs. Tofts. His lordship also began a play on the story of the Queen of Scots."

WHEAT, in botany. See **TRITICUM**. For the culture of wheat, see **HUSBANDRY**. The three principal kinds of bad wheat are, the *blighted*, the *smutty*, and the *worm-eaten*. Blighted wheat is that of which the stalk is a little twisted and rickety, the blade being of a bluish green and curled up, the grain also is green and tubercled: smutty wheat appears as if great part of the ear had been burnt, some small parts only being free, and, in particular, the stem that rises in the centre of the ear, round which the grain is ranged: worm-eaten or rotten wheat is corrupted without losing much of its natural form, or external appearance; the husk is filled with a greasy, black powder, that is insufferably fetid. It appeared, from the experiments of M. Tillet, that there was a kind of infectious quality in all those kinds of wheat; so that if sound wheat was sprinkled with the flour of smutty or rotten wheat, the crop produced would be rotten or smutty. It appeared also, that among the grain which was produced from ground manured with the straw of distempered wheat, there was a much greater proportion of distempered wheat than in that produced from ground manured with the straw of good wheat: the great secret then was to destroy the principle of this contagion in the wheat that was put into the ground; and M. Tillet found, as the result of a great number of experiments, that if the grain, before it is sowed, be well moistened with a solution of sea-salt, or nitre, in common water, none of the ensuing crop will be smutty, or otherwise defective, either in kind or quality; not only supposing the grain that is sowed to be sound, and the soil to be good, but even supposing the grain to be sowed with the flour of smutty wheat, and the ground manured with bad straw.

The following receipt for preventing smutty wheat was published in 1769 by order of the Society for the Encouragement of Arts: they received it from Mr. John Reynolds of Adisham in Kent.

A tub is to be procured that has a hole at bottom, in which a staff and tap-hole is to be fixed over a whisp of straw, to prevent any small pieces of lime passing (as in the brewing way); this done, we put 70 gallons of water, then a corn bushel heap-full of lime-stone, unslaked, stirring it well till the whole is dissolved or mixed, letting it stand about 30 hours, and then run it off into another tub as clear as we can (as practised in beer): this generally produces a hoghead of good strong lime-water; then add three pecks of salt, 42 pounds, which, with a little stirring, will soon dissolve; thus we have a proper pickle for the purpose of brining and liming our seed-wheat without any manner of obfuscation, which is more than can be said in doing it the common way, and greatly facilitates the drilling.

Herein we steep the wheat in a broad-bottomed basket of about 24 inches diameter, and 20 inches deep (for large sowing, made on purpose), running in the grain gradually in small quantities from 10 to 12 gallons up to 16 gallons, stirring the same. What floats, we skim off with a strainer, and is not to be sown: then draw up the basket, to drain over the pickle, for a few minutes; all which may be performed within half an hour, sufficiently pickled; and so proceed as before. This done, the wheat will be fit for sowing in 24 hours, if required; but if designed for drilling, two hours pickled will be found best; and if prepared four or five days before-hand, in either case it makes no difference at all; but should the seed be clammy, and rick to the notches in the drill-box, more lime must be added to the lime-water; here the master must use his discretion, as the case requires; for

some time has much more drying or astringent qualities in it than others. If sea-water can be obtained conveniently, much less salt will suffice, but some will be found necessary even then, otherwise the light grains will not float, a thing of more consequence than is generally imagined, and it ought to be skimmed off and thrown aside for poultry, &c.

WHEEL, in mechanics, a simple machine, consisting of a round piece of wood, metal, or other matter, which revolves on its axis. See **MECHANICS**.

WHEEL-Carriages. See **MACHINERY**.

WHEEL-Animal. See **ANIMALCULE**.

WHEEL, Potter's. See **POTTERY**.

WHEEL is also the name of a kind of punishment to which great criminals are put in divers countries. In some, assassins, parricides, and robbers on the highway, are said to be condemned to the wheel, when they are to have their bones first broken with an iron bar on a scaffold, and then to be exposed, and left to expire on the circumference of a wheel. In Germany they break their bones on the wheel itself.—Of this cruel punishment, it is not certain who was the inventor: it was first used in Germany, and was, indeed, but rarely practised any-where else, till the time of Francis I. of France; who, by an edict of the year 1534, appointed it to be inflicted on robbers on the highway.

WHEELER (Sir George), a learned traveller and divine, was the son of Colonel Wheeler of Charing in Kent, and was born in 1650 at Breda, where his parents as royalists were then in exile. He travelled through various parts of Greece and the East in company with Dr. James Spon of Lyons; and taking orders on his return, was installed a prebend of Durham, made vicar of Basingstoke, and afterward rector of Houghton le Spring. He published an account of his Travels in 1682 in folio; and in 1689, his Observations on ancient Edifices of Churches yet remaining in the East, compared with Eusebius: also the Protestant Monastery, or Christian Economics. He died in 1724.

WHEELINGS, in the military art, are different motions made both by horse and foot, either to the right and left, or to the right and left about.

General Rules for WHEELING.—The circle is divided into four equal points: thence, wheeling to the right or left, is only a quarter of the circle; wheeling to the right or left about is one half of the circle. When you wheel to the right, you are to close to the right, so near as to touch your right-hand man, but without pressing him; and to look to the left, in order to bring the rank about even. When you wheel to the left, you are to close to the left, and look to the right as above directed. This rule will serve for all the wheeling by ranks; as when a battalion is marching by subdivisions with their ranks open, then each rank wheels distinctly by itself, when it comes to the ground on which the ranks before it wheeled, but not before. In wheeling, the men are to take particular care neither to open nor close their ranks, and to carry their arms well. In wheeling, the motion of each man is quicker or slower, according to the distance he is from the right or the left: thus, when you wheel to the right, each man moves quicker than his right-hand man; and wheeling to the left, each man moves quicker than his left-hand man; the circle that every man wheels being larger, according to the distance he is from the hand he wheels to; as may be seen by describing several circles within one another, at two feet distance from each, which is nearly the space every man is supposed to take up.

WHELK, in zoology. See **BUCCINUM**.

WHELPS, in a ship, the seaman's term for those brackets which are set up on the capitan clove under the bars; they give the sweep to it, and are so contrived that the cable

winding about them may not fudge so much as it might otherwise do if the body of the capitan were quite round and smooth.

WHETSTONE, a stone which serves for the whetting of knives and other tools upon.

WHEY, the serum or watery parts of milk.

WHIDAH, a kingdom of Africa, on the coast of Guinea, and to the west of the Gold Coast; extending about ten miles along the sea. It is a populous country, well furnished with large villages; and there are so many small ones, that they are not above a musket-shot from each other. Whidah was conquered by the king of Dahomy. Their trade consists of slaves, elephants' teeth, wax, and honey. The English factory is 200 miles east of Cape Coast Castle, within land. Bows, arrows, beautiful assaguays, and clubs, are the principal weapons of the nation.

WHIDAW-BIRD. See **EMBERIZA**.

WHIG, a party in Britain, opposite to the Tories, from whom they differ chiefly in their political principles. See **TORIES**.

WHIMBREL. See **SCOLOPAX**.

WHIM, in botany. See **ULEX**.

WHINCHEL. See **MOTACILLA**.

WHIP, or **WHIP-Staff**, in a ship, a piece of timber, in form of a strong staff, fastened into the helm, for the steersman, in small ships, to hold in his hand, in order to move the rudder, and direct the ship.

WHIRLPOOL, an eddy, vortex, or gulf, where the water is continually turning round. Those in rivers are very common, from various accidents, and are usually very trivial, and of little consequence. In the sea they are more rare, but more dangerous. Sibbald has related the effects of a very remarkable marine whirlpool among the Orcaades, which would prove very dangerous to strangers, though it is of no consequence to the people who are used to it. This is not fixed to any particular place, but appears in various parts of the limits of the sea among these islands. Wherever it appears, it is very furious; and boats, &c. would inevitably be drawn in and perish with it; but the people who navigate them are prepared for it, and always carry an empty vessel, a log of wood, or large bundle of straw, or some such thing, in the boat with them; as soon as they perceive the whirlpool, they toss this within its vortex, keeping themselves out: this substance, whatever it be, is immediately received into the centre, and carried under water; and as soon as this is done, the surface of the place where the whirlpool was becomes smooth, and they row over it with safety: and in about an hour they see the vortex begin again in some other place, usually at about a mile's distance from the first.

WHIRLWIND, a wind which moves in a spiral direction, as well as horizontally, which is exceedingly rapid and impetuous, but only of short duration. Dr. Franklin's opinion of the origin of whirlwinds has been already given in the article **WATER-SPOUT**. If his theory be true, it will follow, that no hurricane ever can be so violent as to remove an obstacle of the size of only one cubic inch, provided that was supported by a power equivalent to fifteen pounds; for this is the utmost force of the atmosphere when rushing into a perfect vacuum, which never could take place in the centre of a whirlwind or water-spout. Indeed, notwithstanding the dreadful effects sometimes observed from hurricanes and whirlwinds, we shall easily perceive, that the utmost of their power always falls very far short of this. The diminution of the specific gravity of the air by only 1-4th in the middle of the column, would produce such an afflux of air from all quarters, that an obstacle presenting a surface of one foot square, would require a force of 504 pounds to prevent it from being carried away;

which the strongest walls that can be built by human art could scarce resist. Nay, even the tenth part of this, or the diminution of the gravity of the atmosphere by 1-40th part, would produce a pressure of upwards of fifty pounds on every square foot of surface, which, it is to be doubted, whether any of our common houses could resist.

Some philosophers ascribe the vacuum in the atmosphere to which, according to Dr. Franklin's theory, whirlwinds are owing, to a stream of electric matter rushing with violence into the atmosphere out of the earth. But they do not inform us how this matter comes to be accumulated in that part of the earth : what induces it to pass out of the earth ; how it passes invisibly through pure air ; or what serves it for a conductor. It seems to be the fashion among certain philosophers to ascribe every phenomenon, with the cause of which we are unacquainted, to electricity. But this is merely substituting a new name, and serves rather to retard than advance our knowledge of nature.

Some kinds of whirlwinds move with a slow motion, and are injurious only by their vortex ; while others seem to do mischief as well by their progressive as their whirling motion. Of this kind are those called *typhons* ; which, by their frequently following the course of rivers, seem thus also to discover their electrical origin.

WHISKY, a term signifying *water*, and applied in Scotland and in Ireland to a distilled liquor drawn from barley, which is perhaps preferable to any English malt brandy : it is strong, but not pungent, and free from the empyreumatic taste or smell.

WHISPERING-PLACES. See ACOUSTICS.

WHIST, a well-known game at cards, which requires great attention and silence ; hence the name. This game is played by four persons, who cut for partners ; the two highest and the two lowest are together, and the partners sit opposite to each other : the person who cuts the lowest card is to deal first, giving one at a time to each person, till he comes to the last card, which is turned up for the trump, and remains on the table till each person has played a card. The person on the left hand side of the dealer plays first, and whoever wins the trick is to play again, thus going on till the cards are played out. The ace, king, queen, and knave of trumps, are called *honours* ; in case any three of these honours have been played between, or by either of the two partners, they reckon for two points towards the game, and if the four honours have been played between or by either of the two partners, they reckon for four points towards the game, the game consisting of ten points. The honours are reckoned after the tricks ; all above six tricks reckoning also towards the game.

In Hoyle's games may be seen the general rules for playing WHIST, which are too long for insertion here.

WHISTON (William), an English divine of great parts, uncommon learning, and of a singular character, was born at Norton near Twycroft in the county of Leicester, where his father was rector, in 1667. He was admitted of Clare-hall, Cambridge, where he pursued his studies, particularly in the mathematics, and commenced tutor ; which his ill health at length forced him to decline. Having entered into orders, he, in 1694, became chaplain to Dr. More, bishop of Norwich ; and in this station he published his first work, entitled, *A New Theory of the Earth*, &c. in which he undertook to prove the Mosaic doctrine of the earth perfectly agreeable to reason and philosophy. This work brought no small reputation to the author. In the beginning of this century he was made Sir Isaac Newton's deputy, and afterwards his successor, in the

Lucasian professorship of mathematics ; when he resigned a living he had in Suffolk, and went to reside at Cambridge. About this time he published several scientific works, explanatory of the Newtonian philosophy ; and he had the honour of being one of the first, if not the very first, who rendered these principles popular and intelligible to the generality of readers. About the year 1710 he was known to have adopted Arias principles, and was forming projects to support and propagate them ; among other things, he had translated the *Apostolical Constitutions* into English, which favoured the Arias doctrine, and which he asserted to be genuine. The consequence was, that he was deprived of his professorship, and banished the university ; he nevertheless pursued his scheme, by publishing the next year his *Primitive Christianity Revived*, 4 vols. 8vo. for which the convocation fell upon him very vehemently. On his expulsion from Cambridge, Mr. Whiston settled in London ; where, without suffering his zeal to be intimidated, he continued to write and to propagate his *Primitive Christianity*, with as much ardour as if he had been in the most flourishing circumstances. In 1721 a subscription was made for the support of his family, which amounted to 470*l*. For though he drew profits from reading astronomical and philosophical lectures, and also from his publications, which were very numerous, yet these of themselves would have been very insufficient : nor, when joined with the benevolence and charity of those who loved and esteemed him for his learning, integrity, and piety, did they prevent his being frequently in great distress. He continued long a member of the church of England, and regularly frequented its service, though he disapproved of many things in it : but at last he went over to the Baptists, and attended Dr. Forster's meeting at Pinners' Hall, Broad-street. Among other performances not specified above, he wrote *Memoirs of his own life and writings*, which contain some curious particulars.

He was remarkable for speaking the plainest truths on every occasion, and to persons of every degree. During the year 1725, that he, with Dr. Clarke, Dr. Berkeley, and others, had the honour to attend Queen Caroline on a certain day of every week, to talk of the progress of science, her majesty one evening took occasion to pay him a just compliment on his truth and integrity, requesting that he would, with his usual plainness, point out to her any fault that he might have observed in her conduct. At first he begged to be excused, adding, that few persons could bear to have their faults plainly told to them, and least of all royal personages, who, from their elevation, are necessarily surrounded by flatterers, to whose lips truth is a stranger. Her majesty replied, that he was to consider her not as a queen, but as a philosopher ; and that philosophy is of very little use, if it cannot enable its professors to bear without offence truths necessary to their own improvement. Upon this he told her, that the greatest fault which he had observed in her conduct, was her indecent behaviour in the house of God, which he assured her, had made very unfavourable impressions on the minds of many persons, who, coming to town from distant parts of the country, had gone to the chapel to obtain a sight of her majesty, the king, and the royal family. The queen made no reply : but in about six weeks afterwards renewed her request, that Mr. Whiston would point out the most glaring improprieties in her conduct. To this he answered, that he had laid down a maxim from which he could not deviate, never to point out to any person more than one fault at a time, and never to give a second reproof till he had observed some good consequence to have arisen from the first (A). Much to the queen's

(A) Bishop Berkeley was present at these conversations, and from his son we received the account which we have given of them. They are likewise mentioned, but not stated so accurately, by Bishop Newton in his own Life.

Honour, ~~he~~ was pleased with this plain-dealing, and continued to think favourably of Mr. Whiston. This honest, but whimsical and credulous man, died in 1762, at the advanced age of ninety-five.

WHITBY (Dr. Daniel), a very learned English writer, was born in 1638, and bred at Oxford; where, in 1664, he was elected perpetual fellow of his college. He afterward became chaplain to Dr. Seth Ward, bishop of Salisbury; who collated him in 1668 to the prebend of Yatesbury in that church, and soon after to that of Husbourn and Burbach. In 1672 he was admitted chanter of the said church, on the death of Mr. John South, and then, or soon after, rector of St. Edmund's church in Salisbury. He was made a prebendary of Taunton Regis in 1696, and died in 1726. He was ever strangely ignorant of worldly affairs, even to a degree that is scarcely to be conceived. His writings are numerous, and well known; particularly his Commentary on the New Testament.

WHITEY, a sea-port town in the North Riding of Yorkshire, seated on the river Esk, near the place where it falls into the sea. The houses are neat, strong, and convenient; the number of inhabitants about 9000. Ship-building is their principal manufacture. W. Long. $\circ$. 24. N. Lat. 54. 30.

WHITE, one of the colours of natural bodies.

WHITE of the Eye, denotes the first tunic or coat of the eye, called *albuginea*. See **ANATOMY**.

WHITE of an Egg. See **ALBUMEN** and **EGG**.

WHITE Friars, a name common to several orders of monks, from being clothed in a white habit.

WHITE Sea, is a bay of the Frozen Ocean, so called in the north part of Muscovy, lying between Russian Lapland and Samoida; at the bottom of which stands the city of Archangel. This was the chief port the Russians had before their conquest of Livonia.

WHITE Colour for painting. See **COLOUR-MAKING**.

WHITE Tobac. See **CHEMISTRY**, p. 443.

WHITE Iron, or *Tin-plate*, iron-plates covered over with tin; for the method of making which, see **LATTEN**. In 1681 tin-plates were manufactured in England by one Andrew Yarranton, who had been sent to Bohemia to learn the method of making them. But the manufacture was soon afterwards discontinued. It was revived again in 1740, and is now arrived at as great, if not greater, perfection in this country than in any other.

WHITE Lead. See **CHEMISTRY**, p. 437.

WHITE Throat, in ornithology. See **MOTACILLA**.

WHITEFIELD (George), a celebrated Methodist, was born in Gloucester, in 1714, at the Bell-Inn. He was placed at a petty school in this place, and gave early proofs of great elocution and memory. At fifteen he was well versed in the classics. His fame recommended him to Dr. Benson, then bishop of Gloucester, who made him a voluntary offer of ordination, which Mr. Whitefield accepted, and preached daily in fields, prisons, and open streets. He was chaplain to the Countess-dowager of Huntingdon. After a long course of peregrination, he died at Newbury-Port, in New-England, Sept. 30, 1769. The time of his marriage, &c. is not ascertained.

WHITEHAVEN, a sea-port town of Cumberland, with a market on Thursday, and one fair on August 1st for merchandise and toys. It is seated on a creek of the sea, on the north end of a great bergh or hill, washed by the tide of flood on the west side, where there is a large rock or quarry of hard white stone, which gives name to the place, and which, with the help of a strong stone-wall, secures the harbour into which small barks may enter. It is lately much improved in

its buildings, and noted for its trade in pit-coal and salt, there being near it a prodigious coal-mine, which runs a considerable way under the sea. They have a custom-house here; and they carry on a good trade to Ireland, Scotland, Chester, Bristol, and other parts. It is ten miles south-west of Cocker-mouth, and 289 north-west of London. W. Long. 3. 6. N. Lat. 54. 30.

WHITES, or *FLUOR ALBUS*. See **MEDICINE**.

WHITING, in ichthyology. See **GADUS**.

WHITLOW, or *WRITLOE*. See **SURGERY**.

WHITSUN-EARTHINGS, otherwise called *Smoke-farthings* or *Quadrantes Pentecostales*, a composition for offerings which were anciently made in Whitsun-week by every man in England, who occupied a house with a chimney, to the cathedral church of the diocese in which he lived.

WHITSUNDAY, a solemn festival of the christian church, observed on the fiftieth day after Easter, in memory of the descent of the Holy Ghost upon the apostles in the visible appearance of fiery cloven tongues, and of those miraculous powers which were then conferred upon them. It is called *Whitsunday*, or *White-Sunday*; because this being one of the stated times for baptism in the ancient church, those who were baptized put on white garments, as types of that spiritual purity they received in baptism. As the descent of the Holy Ghost upon the apostles happened upon the day which the Jews called *Pentecost*, this festival retained the name of *Pentecost* among the Christians.

WHITSUNDAY-Isle, one of the New Hebrides, which lies about four miles to the south, runs in the same direction, and is of the same length, having more sloping exposures than Aurora: it appears to be better inhabited, and to contain more plantations.

WHORTLEBERRY. See **VACCINIUM**.

WIBURGH, a considerable town of Denmark, in north Jutland, with a bishop's see, remarkable for being the seat of the chief court of justice in the province. The hall where the council assembles has the archives of the country, and escaped the terrible fire that happened in the year 1726, and which burned the cathedral church, that of the Black Friars, the town-house, and the bishop's palace; but they have all been rebuilt more magnificent than before. It is seated on the lake Weter, in a peninsula, twenty-five miles north-west of Sleswick, and 110 north-by-west of Copenhagen. E. Long. 9. 50. N. Lat. 56. 20.

WICKET, a small door in the gate of a fortified place, &c. or a hole in a door through which to view what passes without.

WICKLIFF (John), the first divine in Europe who had resolution to attempt a reformation of religion, was born about the year 1324, in the parish of Wycliff, near Richmond, in Yorkshire. He was educated at Oxford, first in Queen's, and afterwards in Merton college, of which he was a probationer-fellow. Having acquired the reputation of a man of great learning and abilities, in 1361 he was chosen master of Balliol-hall, and in 1365 constituted warden of Canterbury college, by the founder Archbishop Simon de Ilip; but was, in 1387, ejected by the regulars, together with three secular fellows. He thought their proceedings arbitrary, and therefore appealed to the pope; but instead of obtaining redress, in 1370 the ejection was confirmed. This disappointment probably contributed somewhat towards his enmity to the see of Rome, or rather to confirm that enmity; for he had long before written against the pope's exactions and corruptions of religion. However, his credit in the university continued; for having taken the degree of doctor in divinity, he read public lectures with great applause; in which he frequently exposed the impositions of the Mendicant friars. About this time he published

a defence of his sovereign Edward III. against the pope, who had insisted on the homage to which his predecessor King John had agreed. This defence was the cause of Wickliff's introduction at court, and of his being sent one of the ambassadors in 1374 to Bruges, where they met the pope's nuncios, in order to settle several ecclesiastical matters relative to the pope's authority. In the mean time Wickliff was presented by the king to the rectory of Lutterworth in Leicestershire, and in 1375 he obtained a prebend in the church of Westbury in Gloucestershire. Wickliff continued hitherto, without molestation, to oppose the papal authority; but in 1377 a bull was sent over to the Archbishop of Canterbury, and to Courtney bishop of London, ordering them to secure this archheretic, and lay him in irons; at the same time the pope wrote to the king, requesting him to favour the bishops in the prosecution: he also sent a bull to Oxford, commanding the university to give him up. Before these bulls reached England, Edward III. was dead, and Wickliff, protected by John duke of Lancaster, uncle to Richard II. favoured by the queen-mother, and supported by the citizens of London, eluded the persecution of Pope Gregory IX. who died in 1378. In the following year this intrepid reformer presented to parliament a severe paper against the tyranny of Rome, wrote against the papal supremacy and infallibility, and published a book *On the Truth of the Scriptures*, intended to prepare the way for an English translation of them, in which he had made considerable progress. In 1381 he published *Sixteen Conclusions*; in the first of which he ventured to expose the grand article of transubstantiation. These conclusions being condemned by the chancellor of Oxford, Wickliff appealed to the king and parliament; but being deserted by his unsteady patron the Duke of Lancaster, he was obliged to make a confession at Oxford; and by an order from the king was expelled the university. He now retired to his living of Lutterworth, where he finished his translation of the bible. This version, of which there are several manuscript copies in the libraries of the universities, British Museum, &c. is a very literal translation from the Latin vulgate. In 1383 he was suddenly struck with the palsy; a repetition of which put an end to his life in December 1384. He was buried in his own church, where his bones were suffered to rest in peace till the year 1428, when, by an order from the pope, they were taken up and burnt.—Besides a number of works that have been printed, he left a prodigious number of manuscripts; an accurate list of which may be seen in Bishop Tanner's *Bib. Brit. Hib.* Some of them are in the Bodleian Library, others in the British Museum, &c.

Wickliff was doubtless a very extraordinary man, considering the times in which he lived. His natural sagacity discovered the absurdities and impositions of the church of Rome, and he had the honesty and resolution to promulgate his opinions, which a little more support would probably have enabled him to establish: they were evidently the foundation of the subsequent reformation.

WICKLOW, a county of Ireland, in the province of Leinster; bounded on the north by the county of Dublin; on the east by the Irish Sea; on the south by Wexford; and on the west by Kildare and Catherlough. It is thirty-three miles in length, twenty in breadth, and indifferently fruitful. It contains fifty-four parishes, and sends ten members to parliament.

WICKLOW, the capital of a county of the same name, in Ireland; seated on the sea-side, with a narrow harbour, at the mouth of the river Leirtrim, over which stands a rock, instead of a castle, surrounded by a strong wall, twenty-four miles south of Dublin. W. Long. 6. 7. N. Lat. 52. 55.

WIDGEON, in ornithology. See *ANAS*.

WIDOW, a woman who has lost her husband.

WIFE, a married woman, or one joined with, and under the protection of, an husband. See *HUSBAND*.

ISLE OF WIGHT, an island lying on the south coast of Hampshire, from which it is separated by a narrow channel. It is about twenty-one miles in length, and thirteen in breadth. It is nearly divided into equal parts by the river Mede or Cowes, which rising in the southern angle, enters at the northern, into the Channel, opposite the mouth of Southampton Bay. The south coast is edged with very steep cliffs of chalk and freestone, hollowed into caverns in various parts. The west side is fenced with ridges of rocks, of which the most remarkable are those called, from their sharp extremities, the *Needles*. Between the island and the main are various sand-banks, especially off the eastern part, where is the safe road of St. Helen's. Across the island, from east to west, runs a ridge of hills, forming a tract of fine downs, with a chalky or marly soil, which feed a great number of fine-fleeced sheep. Rabbits are also very plentiful here. To the north of this ridge the land is chiefly pasture: to the south of it is a rich arable country, producing great crops of corn. The variety of prospects which this island affords, its mild air, and the neat manner in which the fields are laid out, render it a very delightful spot. It is devoted almost solely to husbandry, and has no manufactory. It is one of the principal resources of the London market for unmalted barley. Among its products are to be reckoned a pure white pipe-clay, and a fine white crystalline sand; of the latter of which great quantities are exported for the use of the glass-works in various parts. Its principal town is the borough of Newport: it likewise contains the two small boroughs of Newton and Yarmouth.

WILD-FIRE. See *Wild-Fire*.

WILDERNESS, in gardening, a kind of grove of large trees, in a spacious garden, in which the walks are commonly made, either to intersect each other in angles, or have the appearance of meanders and labyrinths.

Wildernesses (says Mr. Miller) should always be proportioned to the extent of the gardens in which they are made; for it is very ridiculous to see a large wilderness planted with tall trees in a small spot of ground; and, on the other hand, nothing can be more absurd than to see little paltry squares, or quarters of wilderness work, in a magnificent large garden. As to the situation of wildernesses, they should never be placed too near the habitation, nor so as to obstruct any distant prospect of the country, there being nothing so agreeable as an unconfined prospect: but where, from the situation of the place, the sight is confined within the limits of the garden, nothing can so agreeably terminate the prospect as a beautiful scene of the various kinds of trees judiciously planted; and if it be so contrived that the termination is planted circularly, with the concave towards the sight, it will have a much better effect than if it end in straight lines or angles. The plants should always be adapted to the size of the plantation; for it is very absurd for tall trees to be planted in the small squares of a little garden; and in large designs small shrubs will have a mean appearance. It should also be observed never to plant evergreens among deciduous trees; but always to place the evergreens in a wilderness in a separate part by themselves, and that chiefly in sight.

As to the walks, those that have the appearance of meanders, where the eye cannot discover more than twenty or thirty yards in length, are generally preferable to all others, and these should now and then lead into an open circular piece of grass; in the centre of which may be placed either an obelisk, statue, or fountain; and if in the middle of the wilderness there be contrived a large opening, in the centre of which

may be erected a dome or banquetting-house, surrounded with a green plot of grafs, it will be a considerable addition to the beauty of the whole. From the sides of the walks and openings, the trees should rise gradually one above another to the middle of the quarters; where should always be planted the largest growing trees, so that the heads of all the trees may appear to view, while their stems will be hid from the sight. Thus, in those parts which are planted with deciduous trees, roses, honeysuckles, spiræa frutex, and other kinds of low-flowering shrubs, may be planted next the walks and openings; and at their feet, near the sides of the walks, may be planted primroses, violets, daffodils, &c. not in a straight line, but so as to appear accidental, as in a natural wood. Behind the first row of shrubs should be planted syringas, althæa frutex, mezeoreons, and other flowering shrubs of a middle growth; and these way be backed with many other sorts of trees rising gradually to the middle of the quarters.

The part planted with evergreens may be disposed in the following manner, viz. in the first line next the great walks may be placed the laurustinus, boxes, spurge-laurel, juniper, favin, and other dwarf evergreens. Behind these may be placed laurels, hollies, arbutusæ, and other evergreens of a larger growth. Next to these may be planted alternanthes, phyllireas, yews, cypresses, Virginian cedars, and other trees of the same growth; behind these may be planted Norway and silver firs, the true pine, and other sorts of the fir growth; and in the middle should be planted Scotch pines, pinafer, and other sorts of the larger growing evergreens; which will afford a most delightful prospect if the different shades of the greens are curiously intermixed.

But beside the grand walks and openings (which should always be laid with turf, and kept well mowed), there should be some smaller serpentine walks through the middle of the quarters, where persons may retire for privacy; and by the sides of these private walks may also be scattered some wood-flowers and plants; which, if artfully planted, will have a very good effect.

In the general design for these wildernesses, there should not be a studied and stiff correspondency between the several parts; for the greater diversity there is in the distribution of these, the more pleasure they will afford.

WILKINS (Dr. John), a most ingenious and learned English bishop, was the son of a goldsmith of Oxford, and was born in 1614. He adhered to the parliament during the civil wars, by whom he was made warden of Wadham College in 1648; he married afterwards the sister of Oliver Cromwell, and procured a dispensation to retain his wardenship notwithstanding. Richard Cromwell made him master of Trinity College, Cambridge, from which he was ejected on the Restoration. He then became preacher to Gray's-Inn, rector of St. Laurence Jewry, London, dean of Rippon, and in 1668 was promoted to the bishopric of Chester: he died in 1672. Bishop Wilkins thought it prudent to submit to the powers in being; he therefore subscribed to the solemn league and covenant while it was enforced, and was equally ready to swear allegiance to King Charles when he was restored: this, with his moderate spirit toward dissenters, rendered him not very agreeable to churchmen. His mathematical and philosophical works, which contain many ingenious and curious pieces, considering the time when they were written, have been collected in one volume, 8vo. He published also some theological tracts. He was the first president of the Royal Society.

WILL, that faculty of the mind by which it embraces or rejects any thing offered to it. See METAPHYSICS.

WILL, or Last WILL, in law, signifies the declaration of a man's mind and intent relating to the disposition of his lands, goods, or other estate, or of what he would have done after

his death. In the common law there is a distinction made between a will and a testament: that is called a *will* where lands or tenements are given; and when the disposition concerns goods and chattels alone, it is termed a *testament*. See TESTAMENT.

WILL-with-a-whip, or Jack-with-a-lantern, two popular names for the meteor called *ignis fatuus*. See LIGHT.

WILLIAM of MALMSBURY, an historian of considerable merit in the reign of King Stephen; but of whose life few particulars are known. According to Bale and Pits, he was surnamed *Somerfetus*, from the county in which he was born. From his own preface to his second book *De Regibus Anglorum*, it appears that he was addicted to learning from his youth; that he applied himself to the study of logic, physics, ethics, and particularly to history. He retired to the Benedictine convent at Malmisbury, became a monk, and was made precentor and librarian; a situation which much favoured his intention of writing the history of this kingdom. In this monastery he spent the remainder of his life, and died in the year 1142. He is one of our most ancient and most faithful historians. His capital work is that entitled *De Regibus Anglorum*, in five books; with an Appendix, which he styles *Historia Novella*, in two more. It is a judicious collection of whatever he found on record relative to England, from the invasion of the Saxons to his own times.

WILLIAM of Newberry, so called from a monastery in Yorkshire, of which he was a member, wrote a history, which begins at the conquest and ends at the year 1197. His Latin style is preferred to that of Matthew Paris; and he is entitled to particular praise, for his honest regard to truth, in treating the fables of Jeffery of Monmouth with the contempt they deserve; as well as for expressing his approbation of Henry III.'s design of reforming the clergy, by bringing them under the regulation of the secular power.

WILLIAM of Wykeham, bishop of Winchester, was born in the village of Wykeham, in the county of Southampton, in 1324. He had his education at Winchester and Oxford. Having continued near six years in the university, his patron, Nicholas Wedal, governor of the province of Southampton, took him into his family, and appointed him his counsellor and secretary. He could not have made choice of a fitter person for that employment, no man in that age writing or speaking more politely than Wykeham. For this reason, Edington bishop of Winchester, lord high-treasurer of the kingdom, appointed him his secretary three years after, and also recommended him to King Edward III. who took him into his service. Being skilled in geometry and architecture, he was appointed surveyor of the royal buildings, and also chief-justice in Eyre: he it was who superintended the building of Windsor-castle. He was afterward chief secretary of state, a keeper of the privy-seal; and in 1367 succeeded Edington in the see of Winchester. A little after he was appointed lord high-chancellor and president of the privy-council. That he might well discharge the several functions of his employments, both ecclesiastical and civil, he endeavoured, on one hand, to regulate his own life according to the strictest maxims, and to promote such parish-priests only as were able to give due instructions to their parishioners, and at the same time led exemplary lives: on the other hand, he did all in his power to cause justice to be exactly administered. In 1371 he resigned his chancellorship, and some time after the great seal. Edward being returned to England, after having carried on a very successful war in France, found his exchequer in great disorder. The Duke of Lancaster, one of his sons, at the head of several lords, having brought complaints against the clergy, who then enjoyed most possessions in the kingdom, the king removed them from their employments. But the lay-

men, who were raised to them, behaved so ill, that the king was forced to refore the ecclesiastics. The Duke of Lancaster flowed strong animosity to the clergy, and set every engine at work to ruin Wykeham. He impeached him of extortion, and of disguising things, and obliged him to appear at the King's bench. He got such judges appointed as condemned him; and not satisfied with depriving him of all the temporalities of his bishoprick, he advised Edward to banish him; but this prince rejected the proposal, and afterwards restored to Wykeham all that he had been divested of. Richard II. was but eleven years old when Edward died: where-by the Duke of Lancaster had an easy opportunity of reviving the accusations against the Bishop of Winchester: nevertheless Wykeham cleared himself. Then he founded two noble colleges, the one in Oxford, the other in Winchester. Whilst he was exerting his utmost endeavours to improve these two fine foundations, he was recalled to court, and in a manner forced to accept of the office of lord high-chancellor in 1389. — Having excellently discharged the duties of that employment for three years, he obtained leave to resign it, foreseeing the disturbances that were going to break out. Being returned to his church, he finished his college, and built there to magnificent a cathedral, that it almost equals that of St. Paul's in London. He laid out several sums in things advantageous to the public and to the poor; notwithstanding which, in 1397 he was in great danger; for he and some others were impeached of high-treason in open parliament: however, he was again fully cleared. From that time till his death he kept quiet in his diocese, and there employed himself in all the duties of a good prelate. He died in 1404, in the eighty-first year of his age.

Fort-WILLIAM, a fortress in the Highlands of Scotland, erected in King William's reign, as was also a small town adjoining, called *Maryburgh*, in honour of his queen. It is situated in Invernesshire, on a narrow arm of the sea called *Loch Eil*, which might easily, by a very short canal, be united to the Western sea. Fort-William is of a triangular form, having two bastions, and is capable of admitting a garrison of 800 men; but could not be defended against an attack, as it is commanded by several hills in the neighbourhood.

WILLIAM'S Fort, is a factory of Asia belonging to the East-India Company, seated on one of the branches of the river Ganges, in the kingdom of Bengal. The fort was first built in the shape of an irregular tetragon of brick and mortar; and the town has nothing regular in it, because every one built a house as he liked best, and for his own convenience. The governor's house is within the fort, and is the best piece of architecture in these parts. Here there are also convenient lodgings for the factors and writers, with store-houses for the company's goods, and magazines for ammunition. About fifty yards from the fort is the church, built by the charity of merchants residing here. The town is called *Calcutta*, and has a pretty good hospital for the sick, though few come out of it alive. It is governed by a mayor and aldermen, as most of the company's factories in the East Indies now are. In 1757 it was surprised by the nabob of Bengal, who took it, and put most of those that had made resistance into a place called the *Black Hole*, where most of them were smothered. This nabob was afterwards killed, and another set up in his room, more friendly to the English; and the factory was re-established. E. Long 86. o. N. Lat. 22. 27.

Sweet-WILLIAM. See **DIANTHUS**.

WILLIAMSBURG, a town of North America, in Virginia, and formerly capital of that state. It is situated between two creeks; one falling into James, and the other into York river. The distance of each landing-place is about a mile

from the town, which, with the disadvantage of not being able to bring up large vessels, and the want of enterprise in the inhabitants, has occasioned its decay. Here is a college, designed for the education of the Indians, but which, on account of their aversion to learning, never answered the purpose. It is sixty miles east of Richmond. W. Long. 76. 30. N. Lat. 37. 10.

WILLIAMSTADT, a sea-port town of Holland. It is a handsome strong place, and the harbour is well frequented. It was built by William prince of Orange in 1585; and in 1732 belonged to the stadtholder of Friesland. The river near which it is built called *Butterdijck* or *Holland Diep*; and is one of the Bulwarks of the Dutch on the side of Brabant, where they always keep a garrison. This place made a gallant defence in 1793 against the French, who were obliged to raise the siege. It is fifteen miles north-east of Bergen-op-Zoom, and twelve south-west of Dort. E. Long. 4. 30. N. Lat. 51. 39.

WILLIS (Dr. Thomas), a celebrated English physician, was born at Great Bodwin, in Wiltshire, in 1621, and studied at Christ-church College, Oxford. When that city was garrisoned for the king, he, among other scholars, bore arms for his majesty, and devoted his leisure hours to the study of physic. The garrison of Oxford at length surrendering to the parliament, he applied himself to the practice of his profession, and soon rendered himself famous by his care and skill. He appropriated a room as an oratory for divine service according to the church of England, whither most of the loyalists in Oxford daily resorted. In 1660 he became Sedleian professor of natural philosophy, and the same year took the degree of doctor of physic. In 1664 he discovered the famous medicinal spring at Allstrop, near Brackley. He was one of the first members of the Royal Society, and soon made his name illustrious by his excellent writings. In 1666, after the fire of London, he removed to Westminster; and his practice became greater than that of any of the physicians his contemporaries. Soon after his settlement in London, his only son Thomas falling into a consumption, he sent him to Montpellier in France for the recovery of his health; and it proved successful. His wife also labouring under the same disorder, he offered to leave the town; but she, not suffering him to neglect the means of providing for his family, died in 1670. He died at his house in St. Martin's in 1675, and was buried near her in Westminster-abbey. Dr. Willis was extremely modest and unambitious, and refused the honour of knighthood. He was remarkably pious: as he rose early in the morning, that he might be present at divine service, which he constantly frequented before he visited his patients, he procured prayers to be read beyond the accustomed times while he lived; and at his death settled a stipend of 20*l. per annum* to continue them. He was a liberal benefactor to the poor wherever he came, having from his early practice allotted part of his profits to charitable uses. He was exact and regular in all his hours: and though his table was the resort of most of the great men of London, yet he was remarkable for his plainness, and his being a man of little discourse, complaisance, or society; but he was justly admired for his deep insight into natural and experimental philosophy, anatomy, and chemistry; for his successful practice; and for the elegance and purity of his Latin style. He wrote, 1. A treatise in English, entitled *A plain and easy Method for preserving those that are well from the infection of the Plague, and for curing such as are infected*. 2. Several Latin works, which were collected and printed at Amsterdam, in 1682, in 2 vols. 4to.

WILLUGHBY (Francis), a celebrated natural historian, was the only son of Sir Francis Willughby, knight. He was fond of study from his childhood, and held silence in M m

abhorrence; he being so great an economist with regard to his time, as not willing to lose or misapply the least part of it, by which means he attained great skill in all branches of learning, and particularly in the mathematics. But observing that the history of animals was in a great measure neglected by his countrymen, he particularly applied himself to that province; and for this purpose carefully read over what had been written on that subject by others. He then travelled several times over his native country; and afterwards into France, Spain, Italy, Germany, and the Low-countries, attended by his ingenious friend Mr. John Ray. It is remarkable, that notwithstanding the advantages of birth, fortune, and parts, he was as humble as any man of the meanest fortune; was sober, temperate, and chaste; scrupulously just; so true to his word and promise, that a man might venture his estate and life upon it; so faithful and constant to his friend, as never to desert him when fortune frowned upon him; and remarkably pious, patient, and submissive to the divine will. This is the character given of him by Mr. Ray, whose veracity none will doubt. This ingenious and learned gentleman died in 1672, at thirty-seven years of age; having impaired his health by his application. He wrote, 1. *Ornithologie libri tres*, folio, which was afterwards translated into English, with an Appendix by Mr. Ray, in folio. 2. *Hystorie Piscium libri quatuor*, folio. 3. Letters of Francis Willughby, Esq. added to Philosophical Letters between the learned Mr. Ray and several of his correspondents, published, in 8vo. by William Derham. 4. Several ingenious papers in the Philosophical Transactions.

WILMOT (John), earl of Rochester, a great wit in the reign of Charles II. the son of Henry earl of Rochester, was born in 1648. He was taught grammar and classical learning at the free-school at Burford; where he obtained a quick relish of the beauties of the Latin tongue, and afterwards became well versed in the authors of the Augustine age. In 1659 he was admitted a nobleman of Wadham College, where he obtained the degree of master of arts. He afterwards travelled through France and Italy; and at his return was made one of the gentlemen of the bed-chamber to the king, and comptroller of Woodstock Park. In 1665 he went to sea, and was in the Revenge, commanded by Sir Thomas Tiddiman, when an attack was made on the port of Bergen in Norway; during the whole action he showed the greatest resolution, and gained a high reputation for courage; which he supported in a second expedition, but afterwards lost it in a private adventure with Lord Mulgrave.

Before the Earl of Rochester travelled, he had given in to the most disorderly and imtemperate way of living; at his return, however, he seemed to have got the better of it entirely. But falling into the company of the courtiers, who continually practised these excesses, he became so sunk in debauchery, that he was for five years together so given up to drinking, that during all that time he was never cool enough to be master of himself. His violent love of pleasure, and his disposition to extravagant mirth, carried him to great excesses. The first involved him in sensuality, and the other led him into many adventures and ridiculous frolics. Once disguising himself so that he could not be known by his nearest friends, he set up in Tower-street for an Italian mountebank, and there dispersed his nostrums for some weeks. He often disguised himself as a porter, or as a beggar, sometimes to follow a mean amour; at other times, he would go about merely for diversion, in odd shapes; and acted his part so naturally, that he could not be known even by his friends. In short, by his constant indulgence in wine, women, and irregular frolics, he entirely wore out an excellent constitution before he was thirty years of age. In October, 1679, when recovering from a violent dysentery, which ended in a consumption, he was visited by Dr. Burnet,

upon an intimation that such a visit would be agreeable to him. Dr. Burnet published an account of his conferences with Lord Rochester; in which it appears, that though he had lived the life of a libertine and atheist, yet he died the death of a penitent Christian. His death happened in 1680; since which time his poems have been various times printed, both separately and together: but when once he obtained the character of a lewd and obscene writer, everything in that strain was fathered upon him; and thus many pieces not of his writing have crept into the later editions of his works. The author of the Catalogue of Royal and Noble Authors says, he was "a man whom the Muses were fond to inspire, and ashamed to avow; and who practised without the least reserve that secret which can make verses more read for their defects than their merits." Lord Rochester's poems have much more obscenity than wit, more wit than poetry, and more poetry than politeness. His writings, besides those already mentioned, are, A Satyre against Mankind; Nothing, a poem; Valentinian, a tragedy; Fifty-four Letters to Henry Saville, and others: Seven more to his Wife and Son: a Letter on his deathbed to Dr. Burnet. He also left behind him several other papers, and a History of the Intrigues of the Court of Charles II. but his mother, a very devout lady, ordered all his papers to be burned.

WILSON (Florence), known in the republic of letters by the name of *Florentius Volafinus*, was born at Elgin in the shire of Murray in Scotland, and educated in the university of Aberdeen. Travelling to England with an intention to improve his fortune, he had the felicity to be introduced to Cardinal Wolsey, who appointed him tutor to one of his nephews. In that capacity he went to Paris, and continued there till the cardinal's death. During his residence in that city he became acquainted with the learned Cardinal Bellai, archbishop of Paris, who allowed him a pension, and meant to have appointed him royal professor of the Greek and Latin languages in the university of Paris: but Bellai being disgraced, Wilson's prospects faded with the fortunes of his patron, whom nevertheless he attended on his journey to Rome. Wilson was taken ill at Avignon, and the cardinal proceeded without him. After his recovery, he paid a visit to the celebrated Cardinal Sabolet, the Mæcenas of his time, who was also bishop of Carpentras, where he then resided. The cardinal was so charmed with his erudition, that he appointed him professor of the learned languages, with a stipend of 100 pistoles per annum.

During his residence at Carpentras, he wrote his celebrated treatise *De Animi Tranquillitate*. Mackenzie says that he afterwards taught philosophy in Italy; and that, being at length desirous of returning to Scotland, he began his journey homeward, was taken ill at Vienne in Dauphiny, and died there in the year 1547. He was generally esteemed an accomplished linguist, an admirable philosopher, and an excellent Latin poet. He wrote, beside the above treatise, 1. *Poemata*. Lond. 1619. 4to. 2. *Commentatio quædam theologia in aphorismis dissecta, per Sebast. Gryph.* 3. *Philosophie Aristot. Synopsis*, lib. iv.

WILSON (Dr. Thomas), bishop of Sodor and Man, was born at Burton-Wirral in Cheshire, December 1663. From a private school at Chester he was removed to Trinity College, Dublin, intending to study physic; which, however, he soon relinquished for divinity, and was ordained deacon, June 29, 1686. He left Ireland soon after, and became curate of New Church, in the parish of Winwick, Lancashire, of which his maternal uncle, Dr. Sherlock, was then rector. October 20, 1689, he was ordained a priest; and, in 1692, became domestic chaplain to the Earl of Derby, as well as preceptor to his son Lord Strange. Soon after, he was elected master of

the alms-house at Latham. In 1696 he was offered by his patron the bishopric of the Isle of Man, which had been vacant since 1693. This Mr. Wilton modestly declined, but was in a manner forced to accept it. January 16, 1697-8, being first created by Archbishop Tenison, LL.D. he was consecrated at the Savoy-church by Archbishop Sharp, and the April following landed in his diocese. In September he went to England, and in October was married at Winwick, to Mary, daughter of Thomas Patten, esq. of Warrington; with whom he returned to his diocese, April 1699. In 1699 he published a small tract in Manks and English, entitled, *The Principles and Duties of Christianity*, for the use of the island; and, with the assistance of Dr. Thomas Bray, began to found parochial libraries, which he afterwards established and completed throughout his diocese. In 1707 he was made D.D. in full convocation at Oxford; and the same honour was decreed to him the same year at Cambridge.

He continued to perform all the offices of a good bishop and a good man; but the orthodoxy of his spirit, and zeal for church discipline, involved him in altercations and difficulties, especially with the governor, among which the following is recorded: Mrs. Horne, the governor's wife, had defamed Mrs. Fuller and Sir James Pool with a false charge of criminal conversation; and, in consequence of being contumacious, and refusing to ask pardon of the persons injured, was by the bishop banished from the holy communion. But Mr. Horribin, his archdeacon, who was chaplain to Captain Horne, received Mrs. Horne to the communion, and was suspended by the bishop. Upon this, the governor, conceiving that the bishop had acted illegally, fined him 50l. and his two vicars-general 20l. each; and, on their refusing to pay this fine, committed them all, June 29, 1722, close prisoners to Castle Rushin. After a confinement of nine weeks, the bishop was released, on petitioning the council; who afterwards, on July 4, 1724, reversed all the proceedings; as the governor had not competent jurisdiction. He died March the 7th, 1755; his wife died fifty years before, on the very same day: all his children died young except Thomas the youngest. His writings, in two volumes folio, consist of Religious Tracts and Sermons, with a short History of the Isle of Man: he also formed a plan for translating the New Testament into the Manks language, which was completed by his successor, Dr. Mark Hildesley.

WILTON, a market-town in Wiltshire, three miles west of Salisbury. It was once so considerable as to give title to the county. It formerly had twelve churches; and Odo, brother-in-law to William I. was bishop of Wilton: only one now remains. It sends members to parliament, and is the place where the knights of the shire are chosen. It has a great manufactory of carpets, which are brought to high perfection. Wilton is famous for Lord Pembroke's seat, so well known through Europe for its containing a grand assemblage of the productions of the greatest and most ancient masters in painting and sculpture.—Two fairs are held here annually.

WILTSHIRE, a county of England, bounded on the west by Somersetshire, on the east by Berkshire and Hampshire, on the north by Gloucestershire, and on the south by Dorsetshire and part of Hampshire. The length amounts to thirty-nine miles; its breadth to thirty; and its circumference to 140. It contains twenty-nine hundreds, twenty-three market-towns, 304 parishes, and about 876,000 souls. Besides two members for the shire, and two for the city of Salisbury, each of the following towns sends two members to parliament, viz. Wilton, Downham, Hindon, Heytesbury, Westbury, Calne, Devizes, Chippanham, Malmesbury, Cricklade, Great Bedwin, Ludgerhall, Old Sarum, Wootton-Basset, Marlborough. The air of this county is very healthy, not only in the more low

and level parts, but also on the hills. The soil of the vales is very rich, and produces corn and grass in great plenty. The beautiful downs in the south yield the finest pasture for sheep, with which they are overspread. The greatest disadvantage the county labours under is want of fuel, as there are no coal-pits, and but little wood. This county is noted for great quantities of very fine cheese, and for its manufacture of broad cloth, to which it was invited by the great plenty and fineness of its wool. Besides a number of lesser streams, it is watered by the rivers Isis, Kennet, Upper and Lower Avon, Willy, Burne, and Nadder, which are well filled with fish.

WINCHELSEA, a town in Suffex, which has no market, but has one fair on May 14th for cattle and pedlars' ware. It was an ancient place, at least the old town, which was swallowed up by the ocean in 1250. It is now dwindled to a mean place, though it retains its privileges, and sends two members to parliament. It is seated on a rocky cliff, on an inlet of the sea; and had a haven, now choked up. It had eighteen parish-churches, now reduced to one. The market-house is in the midst of the town, from whence run four paved streets, at the end of which are four ways, which had formerly buildings on each side for a considerable distance. It is two miles south-west of Rye, and seventy-one south-east of London. It is governed by a mayor and jurats, though it has but about seventy houses. Three of the gates are still standing, but much decayed. E. Long. o. 44. N. Lat. 50. 58.

WINCHELSEA (Anne countess of), a lady of excellent genius, especially in poetry, was maid of honour to the Duchess of York, second wife to King James II. and was afterwards married to Heneage, second son of the Earl of Winchelsea. One of the most considerable of the Countess of Winchelsea's poems was that on the Spleen. A collection of her poems was printed at London in 1713, containing a tragedy never acted, entitled *Amphomenes*. The countess died in 1720, without issue, as her husband did in 1726.

WINCHESTER, the capital of the county of Hampshire in England. It is a very ancient city, supposed to have been built several centuries before Christ. The Romans called it *Venta Belgarum*, the Britons *Caer Gwent*, and the Saxons *Wittancester*; whence came the present name. It stands upon the river Itchen, in a bottom surrounded with chalky hills; and is generally allowed to have been a considerable place in the time of the Romans. Some of the first converts to Christianity are supposed to have lived here. In the castle, near the west-gate, many of the Saxon kings anciently kept their court. The cathedral was founded by Kenegulf, a king of the Mercians; but there were many Christians, and places for their worship here, long before that period. It is a large pile, and has a venerable look, but it is not very elegant. Besides the tombs, there are many curious pieces of workmanship in it; the chief of which are, 1. The font, erected in the time of the Saxons. 2. Copper statues of James I. and Charles I. 3. The bishop's throne. 4. The stalls of the dean and prebendaries. 5. The ascent to the choir and altar. 6. The pavement, inlaid with marble of divers colours, in various figures. 7. The altar-piece, reckoned the noblest in England. 8. The paintings in the windows, especially the great east window. At the hospital of the Holy Cross, every traveller that knocks at the door may claim a manchet of white bread and a cup of beer: of which a great quantity is provided every day for that purpose. This hospital was intended for the maintenance of a master and thirty pensioners, but only fourteen are now maintained in it; and the master enjoys a revenue of 800l. a-year. This city is about a mile and a half in compass, and almost surrounded with a wall of flint, has six gates, large suburbs, broad clean streets; but the private houses are in general but ordinary, many of them being very

old. The city is interspersed with a great many gardens, which contribute to its beauty and healthiness. The corporation consists of a mayor, high-steward, recorder, aldermen, two coroners, two bailiffs, twenty-four common-council-men, a town-clerk, four constables, and four sergeants at mace; and the city gives the title of *marquis* to the Duke of Bolton. A Roman highway leads from hence to Alton; and went formerly, as it is thought, from thence to London. The charming downs in the neighbourhood contribute greatly to the health and pleasure of the inhabitants. The river Itchin is navigable for barges from hence to Southampton. W. Long. 1. 21. N. Lat. 51. 5.

WINCKLEMAN (Abbé John). This wonderful man was born at Stendall, in the old Marche of Brandenburg, in the beginning of the year 1718, the son of a shoe-maker, to all appearance destined by his birth to superintend a little school in an obscure town in Germany, raised himself to the office of president of antiquities in the Vatican. After having been seven years professor in the college of Seheulen near Salfwedel, he went into Saxony, where he resided seven years more, and was librarian to Count Bunau at Nothenitz. When he left this place, in 1754, he went to Dresden, where he formed an acquaintance with the ablest artists. In that year he abjured Lutheranism, and embraced the Roman-catholic religion. In September 1755 he set out for Italy, and arrived at Rome in December following. While engaged in teaching some boys their A B C, he aspired to a knowledge of the beautiful, and silently meditated on the comparisons of Homer's Greek with the Latin literature, and a critical acquaintance with the respective languages, which were more familiar to him than they had ever been to any former lover of antiquity, both by his application in studying them, and his public lectures as professor of them. This erudition enabled him to fill up his principal plan of writing the History of Art. In 1756 he planned his Restoration of Ancient Statues, and a larger work on the Taste of the Greek Artists; and designed an account of the galleries of Rome and Italy, beginning with a volume on the Belvedere statues, in the manner of Richardson, who, he says, only ran over Rome. He also intended a history of the corruption of taste in art, the restoration of statues, and an illustration of the obscure points of mythology. All these different essays led him to his History of Art, and his Monumenti Inediti. Having published his Remarks on ancient Architecture, he was going to Naples, with two crowns, part of a pension from the king of Poland, for his travelling charges, and thence to Florence, at the invitation of Baron Stofch, when Cardinal Archinto, secretary of state, employed him to take care of his library. Cardinal Albani having succeeded to the place of librarian of the Vatican, he endeavoured to get a place for the Hebrew language for Winckelman, who refused a canonry, because he would not take the tonsure. The elector of Saxony gave him, in 1761, unsolicited, the place of Counsellor Richter, the direction of the royal cabinet of medals and antiquities at Dresden. Upon the death of the Abbé Venuti, in 1762, he was appointed president of the antiquities of the apostolic chamber, with power over all discoveries and exportations of antiquities and pictures. This is a post of honour, with an income of 160 scudi *per annum*. He had a prospect of the place of president of antiquities in the Vatican, going to be created at 16 scudi per month, and was named corresponding member of the Academy of Inscriptions. He had thoughts of publishing an Essay on the Depavation of Taste in the Arts and Sciences. The King of Prussia offered him by Col. Quintus Icilus, the place of librarian and director of his cabinet of medals and antiquities, void by the death of M. Gautier de la Croze, with a handsome appointment. He made no scruple of accepting

the offer; but, when it came to the pope's ears, he added an appointment, out of his own purse, and kept him at Rome. In April, 1768, he left Rome, to go with M. Cavaceppi over Germany and Switzerland. When he came to Vienna, he was so pleased with the reception he met with, that he made a longer stay there than he had intended. But, being suddenly seized with a secret uneasiness, and extraordinary desire to return to Rome, he set out for Italy, putting off his visits to his friends in Germany to a future opportunity. As he passed through Trieste, he was assailed, June 8, 1768, by a wretch named Arcangeli, a native of Campiglio, a town in the territory of Pistoia, with whom he had made an acquaintance on the road, and who stabbed him in five different places. The abbé being laid on a bed in the midst of the most violent pain, had composure sufficient to receive the last sacraments, and to make his will, in which he appointed Cardinal Alexander Albani his residuary legatee, and expired in the afternoon. The murderer was soon after apprehended, and executed on the wheel, June 26.

WIND, is a sensible agitation of the atmosphere, occasioned by a quantity of air flowing from one place to another. As the air is a fluid, subject to the same laws of gravitation as other fluids, it necessarily has a constant tendency to preserve an equilibrium in every part; so that if, by any means whatever, it is rendered lighter in any one place than another, the weightier air will rush in from every side towards this place, till as much be there accumulated as makes it of an equal weight with the rest of the atmosphere: it is these currents of air which are called *winds*.

Many are the causes which may vary the weight of the atmosphere, and occasion particular tropical winds.

Although other causes may occasion winds in certain circumstances, yet their principal and most universal cause is the sun, which warmeth the air to a much greater degree in some places of the atmosphere than in others; and as the air is susceptible of a great degree of expansion by heat in those places where it is heated to any considerable degree, it is expanded so much as to become lighter than the air in those places where it is colder; so that the weightier cold air from all the circumjacent parts rushes towards this point to restore the equilibrium which had been destroyed. So that if there be any particular part upon the earth's surface where the sun acts constantly with greater force than on any other part, a current of air will constantly flow from there towards the warmer region: but the sun acts with greater force upon those parts of the earth which are nearest the equator, than those which approach towards either poles; so that we might naturally expect that a wind would constantly blow from the polar regions towards the equator; which is really found to be the case in the torrid zone, where the influence of the sun overcomes almost all the other lesser causes which produce the variable winds in our more northerly regions. However, even in the torrid zone, these north and south winds are varied in different ways.

Although the heat of the equatorial region is greater than any other, yet as the sun acts perpendicularly in his diurnal course upon one point of the equator only at one time, and immediately passes over it, and as the air retains the heat communicated to it by the sun but for a short time, cooling gradually as he retires, and continuing still to decrease till his influence again returns the following day; the degree of heat upon this great circle must be very different in different parts, and perpetually varying in every point; which must in some measure tend to disturb those winds coming from the polar regions, which we have already mentioned. To comprehend clearly what will be the effects of this rotation, let us consider what effect it would naturally produce upon the equator with

regard to wind, supposing no other cause should interrupt it. And here we must observe, that as the point upon which the sun acts with the greatest power is constantly moving from east to west, the air to the east of that point over which the sun has more lately passed will be more rarified than that to the west, and will naturally flow towards that point from east to west with greater velocity than from west to east, as the cool air to the west of that point will be interrupted in its motion towards it by the motion of the sun meeting it. Hence therefore it follows, that from the diurnal motion of the earth from west to east a constant wind would always be produced, were it not obstructed by other causes. But as there is a constant stream of air flowing from the polar towards the equatorial regions, a composition of these two currents of air acting at the same time will produce a north-east wind in all parts of the northern hemisphere, and a south-east wind in all parts of the southern one. These winds are known by the name of the *general trade winds*.

If there were no inequalities on the surface of our globe, and if it were composed of a substance perfectly homogeneous, this wind would invariably take place at all times on every part of the earth's surface: but as this is not the case, it is liable to several very considerable variations. In all those regions towards the poles, as the influence of the sun is there but weak, other lesser causes occasion particular winds, and disturb that regularity which at first view we might expect; so that the general trade wind does not invariably take place beyond the 23rd or 30th degree of latitude; and the regions between that and the poles have nothing but variable winds. Even in the torrid zone, there are many causes which in particular places alter this direction of the wind; so that the genuine trade-winds do not take place except in the Atlantic and Pacific oceans on each side the equator to the distance of 28 or 30 degrees, and in the greatest part of the Indian ocean to the south of the equator.

Having thus explained the nature and causes of the general trade-wind, we now proceed to take notice of the principal deviations which take place in the torrid zone. The general trade-wind, when thus altered at particular seasons, is known by the name of *monsoons*. There are other variations, which, although as general, are yet of smaller and more limited influence. These are known by the name of *breezes*; and as they blow periodically from the sea, they are denominated *sea or land breezes*, and take place more or less in every sea-coast within the tropics. As the causes of the monsoons will be more clearly comprehended after the nature of these breezes is explained, we shall first consider them.

The sea and land breezes of the torrid zone are gentle periodical winds regularly shifting twice every day, and blowing from the sea towards the land during the day-time, and from the land towards the sea in the night. These breezes do not blow with an equal degree of force throughout the whole day and night, but are perpetually varying, being always strongest about mid-day and midnight, and becoming gradually weaker till the time of change in the evening and morning; about which time the air continues for a short space perfectly calm: but in a little the breeze begins to be felt on the side opposite to that from which it blew last, so faint at first as hardly to be perceived; but by degrees acquiring greater strength, it goes on increasing for five or six hours, after which it again as gradually sinks and dies away. They always blow directly off or towards the shore, and never extend their influence to a great distance from it, although this is varied by particular circumstances in different places; as they never extend so far from the points of capes and promontories, as in deep bays; nor upon the windward, as leeward-shores.

These breezes are produced by the same cause which gives rise to the trade-wind, viz. the heat of the sun. In these warm regions the days and nights are nearly of an equal length throughout the whole year; the sun rising high in the day-time, and descending almost perpendicularly at night; which occasions a much greater variation between the heat of the day and night than is experienced in the more temperate climates; and it is this great difference between the heat of the night and day which produces the breezes. For the rays of the sun are reverberated from the land during the day-time much more powerfully than from the sea, whose surface is constantly evaporating; and the air above the land is rendered much warmer, and consequently more rarified than above the sea; so that a current of air necessarily takes place at that time from the sea towards the land, increasing and diminishing in strength as the heat increases or declines. But when the sun descends below the horizon, the evaporation from the surface of the sea is stopped or greatly diminished, and the cold which it occasioned is of consequence removed: the reverberation of the sun's rays from the surface of the earth is likewise removed, and the air above the land quickly resumes its natural degree of cold, which is always greater than the sea when the influence of the sun is withdrawn: so that the air above the sea becomes warmer during the night than that above the land, and a current of air is of course established from the land to the sea, which forms the land-breeze, which acts as uniformly, although less powerfully, than the sea-breeze; blowing at first gently as the air begins to cool, and gradually gathering strength as the sun retires below the horizon; till his influence begins to be full again in the morning, when it gradually gives place to the more powerful influences of the sea-breeze. These breezes are not, however, entirely confined to the torrid zone. They are even felt in more northern regions; the sea-breeze in particular being almost as perceptible during the summer season along the coasts of the Mediterranean and the Levant, both on the African, European, and Asiatic shores, as within the tropics. Even in our own colder climate, the effects of this are often sensibly felt during the summer season; although, from the length of the day and shortness of the night, the difference between the heat of these is far less than in warmer climates. And although the shortness of our nights prevents us from feeling a nocturnal breeze, similar to the land-breezes of the torrid zone; yet in every serene evening, we have an opportunity of observing a phenomenon, proceeding from a similar cause with that which occasions them in warmer climates. For as the waters retain their heat longer than the earth after the sun withdraws, the moisture which was raised during the heat of the day to a small distance from the earth's surface is quickly condensed by the cold of the evening, and falls down in copious dews; whereas that which is above the surface of the water is more slowly condensed, by reason of the heat which that element retains longer, and hovers at a small distance above it in the form of a dense vapour, which slowly subsides as it loses its heat. This is the cause of those low mists which are so often seen hovering above the surface of rivers and other waters in the evenings towards the end of summer.

It was already observed, that in the Indian ocean the general trade-wind only took place in some parts to the south of the equator. To the north of the line, and in some places to the south of it in that ocean, the general trade-wind only blows regularly for six months; and during the other six months the wind blows in a direction entirely opposite. It is these winds, which shift thus regularly, which are called *monsoons*, although they are also sometimes called *trade-winds*.

At the equator the days and nights are always of an equal

length throughout the whole year; so that the heat being thus equally divided, it never arrives to such an intense degree as to be insupportable to the inhabitants. And as there is no vicissitude of seasons at the equator, so at the poles they never experience the more pleasing vicissitudes of day and night, the sun never setting during the summer season, nor rising above the horizon during the winter: and although the day decreases in length as we recede from the pole, from six months to twenty-four hours; yet in all high latitudes the sun defends for such a short space below the horizon, and in such an oblique direction, that the difference between the heat of the day and night is but very inconsiderable. From which it follows, that during this season, when the sun continues to act with such uninterrupted influence upon the surface of the earth, the air will then be rarefied more above the dry land than upon the surface of the water; so that a wind would naturally set in at that time from the sea towards the land, similar to the diurnal sea-breezes in the warmer climates; and on the contrary, during the winter season, the air in these northern regions being colder above the land than the water, the winds will naturally blow from the land towards the sea, similar to the land-breezes of the torrid zone. But as the influence of the sun, although of longer continuance, is in general more languid in climates of a high latitude than in those near the line, it is not to be expected that these effects will follow with the same regularity as in the torrid zone: being more apt to be interrupted by lesser causes which affect the atmosphere and produce winds in different directions. Yet these are not so totally interrupted but that we can easily trace their effects even in our own cold climate: for during the summer season, the large continent to the east of us, being more heated than the Atlantic ocean westward, produces a general tendency of the current of air towards the east, inasmuch that westerly winds are observed to prevail more than any other, not only here, but in all the frontier countries on the continent, during the summer season. And easterly winds become again more prevalent in the winter and spring. On the contrary, it is observed in North America, that the easterly winds prevail more in summer than at any other time; and the west winds always prevail during the cold months of winter. The same effects take place with a greater degree of constancy in other parts of Europe, particularly in Greece, and the countries in that neighbourhood; as the ancient Greeks have particularly remarked, that the winds blew from the south during the heat of summer, particularly about the dog-days, and from the north during the colder weather of winter.

Any attentive reader, who has accompanied us thus far, will readily see, that the monsoons which take place in the Indian ocean proceed from the same general cause. For when the sun, in his annual course, has crossed the line, and comes to act very strongly upon the extensive countries of Arabia, Persia, China, and the other parts of India, these become heated to a much higher degree than the ocean to the south of them; and the air above these extensive countries being so much rarefied, naturally draws the wind towards that place, which, by overcoming the general trade-wind, produces the southerly monsoons which take place in all those seas during the months of April, May, June, July, August, and September. But when the sun has again retreated towards the southern hemisphere, this great degree of heat in these countries subsides, and the genuine trade-wind again resumes its natural course; forming what they call the *northerly monsoon*, which blows in the months of October, November, December, January, February, and March: and as the continent of Asia now assumes a greater degree of cold than the Atlantic and Pacific oceans in the same latitude, it produces a brisker and more

steady gale during the continuance of this monsoon, than is ever experienced in the general trade-wind.

Having thus explained the nature of the monsoons in general, we shall proceed to consider the particulars which influence the direction of these in those parts where they take place. In all that part of the Indian ocean which lies between the island of Madagascar and Cape Commorin, the wind blows constantly from the west-south-west, between the months of April and October; and in the opposite direction from the month of October till April, although with some variation in different places, as these winds are neither so strong nor constant in the bay of Bengal as in the Indian ocean. And it is likewise remarkable, that the south-west winds in these seas are generally more southerly on the African side, and more westerly on the Indian, as appears distinctly in the map. But these variations are not repugnant to the general theory. For it is sufficiently known, that high lands in every part of the globe are much colder than low and flat countries; and as that part of Africa is very high and mountainous, the cold in these regions is much greater than in the more flat countries of Arabia and India; so that the wind naturally blows from these cold regions, in the summer season, towards the warmer continent of Asia; which occasions those inflections of the wind to the eastward which take place in these seas during the summer months; and is still farther assisted by the peninsula of India, the kingdom of Siam, and the islands of Sumatra and Java, on the eastern part of this ocean, lying so much farther south than the kingdoms of Arabia and Persia; so that these, being more heated than the ocean to the westward, naturally draw the wind towards them, and produce the easterly variation of the monsoon which takes place in this part of the ocean, while the warm and sandy deserts of Arabia draw the winds more directly northward near the African coast.

In the eastern parts of the Indian ocean, beyond the island of Sumatra, through the gulph of Siam and bay of Tonquin, and along the southern parts of China, and among the Philippine islands, &c. to the north of the equator, the monsoons observe a different direction, blowing nearly due south and north. Here the greatest part of the warm continent is to the west of this district, which makes the wind naturally assume this direction. A little to the east of this, among the Marianne islands, the general trade-wind takes place, there being no continent to the north of them to occasion monsoons.

The monsoons are as regular in the eastern part of the Indian ocean to the south of the equator, as they are to the north of it; as here a northern monsoon sets in from the month of October till April, and a southern from April to October. And here, as to the north of the line, we find the direction of the monsoons varying according to particular circumstances in different places: for about the island of Sumatra, and towards the west end of Java, the monsoons set in nearly from the north and south; but towards Celebes and Timur, they begin to tend a little more to the east and west, gradually declining as they approach the coast of New Guinea; near to which the northerly monsoon from October till April blows from the north-west, and the opposite monsoon from the south-east between October and April. The reader will easily perceive that these monsoons are occasioned by the continent of New Holland and Guinea; which being heated by the sun when in the southern signs, draws the wind towards that in the summer season, in the same manner as the continent of Asia produces the monsoons to the north of the line. And it is likewise sufficiently plain, that the inflection of these periodical winds about Celebes and Timur is occasioned by that part of the continent called *New Guinea* jutting out so

near to the equator to the east of these, and drawing the wind toward that quarter.

These are the most general and extensive monsoons which take place in our globe. But there are other periodical winds, which occur in particular places in these warm regions, that deserve particular attention.

In the Red Sea, the monsoon shifts as regularly as in other places; but being influenced by the coasts, it tends a little more to the north and south than in the Indian Ocean.

On the fourth coast of Africa, to the fourth of Cape Corientes, and about the southern parts of the island of Madagascar, the regular trade-wind from the S. E. takes place between October and April; but from April till October the wind blows from the W. or N. W. and is at that season exceedingly cold. This is evidently occasioned by a cause already taken notice of: for notwithstanding the high and cold nature of this continent, yet when the sun is to the south of the line, his powerful influence at that season so far abates their natural degree of cold, as not to interrupt the general trade-wind between the months of October and April: but when he returns to the northern hemisphere, the high mountains of Africa resume their native coldness, and repel the general trade-winds by their cold and more powerful blast, so as to produce the intemperate monsoon which here takes place between the months of April and October.

From Mozambique to Cape Guardafoy, at the mouth of the Red Sea, the monsoons are a little more irregular than in the other parts of the Indian Ocean. For it is observed, that between October and January the winds are variable, although chiefly from the north. In January the N. E. monsoon sets in, and continues regular till the month of May. From May till October the winds again become variable, but blow chiefly from the southern points; but in the months of June, July, and August, there are frequent calms, especially about the bay of Melinda, which sometimes continue for several weeks together, and extend only about 100 leagues from shore.

Before we can explain the cause of this irregularity clearly, it will be necessary to attend to the direction of the wind on each side of this track at each particular season. In the months of October, November, and December, the winds are here variable, but chiefly from the north. Now during these three months, the wind to the south of this beyond Cape Corientes blows from the S. E. at the Red Sea, and all to the north of this, the wind during this season of the year is from the N. E. And as the sun is then perpendicular to the bay of Melinda, these opposite winds here meeting and opposing one another, and being both of them stopped in their course westward by the cold regions of Africa near the Mountains of the Moon, will naturally produce the variable winds here observed, according as the one or the other of these three balancing powers shall predominate: although, as the coast here runs away towards the south-west, it is natural to expect that the northerly wind, which follows the same direction, should more frequently prevail than those which are opposed by it; especially when we consider, that the island of Madagascar, now beginning to be warmed by the influence of the sun, will concur in drawing the wind to the southward; and when the continent of Africa is more heated in the months of January and February, it does not oppose the easterly monsoon, so that the winds become then more fixed than before. But in the months of June, July, and August, the wind to the south of Cape Corientes is from the N. W.; and near the Red Sea, and throughout the northern part of the Indian Ocean, the S. W. monsoon is then in its greatest vigour; so that on each end of this district the wind is blowing in an opposite direction; from which re-

sults those calms about Melinda, which we just now mentioned.

This much may suffice for the shifting winds on the African and Asiatic coasts. As to America, the only places where the wind shifts regularly are, the bays of Honduras and Campeachy on the east, and that of Panama and some parts on the coast of Mexico on the west, with a small tract upon the coast of Brazil. In the fourth part of the bay of Honduras, between Cape Gratia de Dios and Cape la Bela, the common trade-wind between E. and N. E. blows between March and November; from October till March there are westerly winds, not constant or violent, but blowing moderately sometimes two or three days, or a week; and then the easterly breeze may again prevail for an equal length of time. The reason of the peculiarity here observed, is this: During the summer season, the high land on the isthmus of Darien is so much warmed as not to interrupt the course of the general trade-winds; but when he retires to the southern hemisphere, the cold upon the isthmus at that season becomes so great, as to condense the air to such a degree as to repel the trade-wind for some time: but not being cooled to such an intense degree as in some of the larger continents, the trade-wind at times overcomes and repels these land-breezes in its turn, and produces the phenomena above described. And that this is really the case, appears evident from this circumstance, that the land breezes are most prevalent, and of longest duration in the coldest months of December and January; before and after which two months, the trade-wind being generally checked only a day or two about the full or change of the moon. As these western breezes on this coast take their rise from the same cause as the diurnal land-breeze in warm climates, they may be considered as land-breezes of two or three days' continuance, and forming an intermediate step between the land-breezes and monsoons. Although the influence of these breezes is felt farther off at sea than the common diurnal breeze, yet they do not extend a great way, being seldom felt above 20, 30, or 40 leagues from shore; and about Cape La Vela, which is much exposed to the east wind, these breezes seldom extend above eight or ten leagues from shore. Land breezes of the same nature, and proceeding from similar causes, are also experienced in the winter season in the bay of Campeachy, which are there known by the name of *Simmafenta winds*. Beyond Cape La Vela these western breezes are not felt, which is undoubtedly occasioned by the whole of that coast as far as Cape St. Augustine being so much exposed to the general trade wind, which here sweeps along the coast with so much violence, as almost totally to repress the weaker influence of the breezes. But between Cape St. Augustine and St. Catharine's island, or a little farther, we again meet with a variation of the wind at different seasons, as it is here observed to blow in an E. or N. E. direction from September till April, and from April till September from the S. W. This variable wind, or monsoon, like the others on this coast, extends but for a very short way from shore, and is evidently occasioned by the same causes as the other periodical winds. For in the summer months (which in this climate is between September and April), the land of the continent being heated by the sun, draws the trade-wind from its common course of S. E. a little to the westward: and as the coast here tends towards the S. W. the wind in some measure (as it always does) follows the same direction, and produces this E. N. E. monsoon. But in the winter, when this region becomes more cool, the east wind is repelled by the dense cold air from the mountains; by which means it is bent to the northward, and is forced along the coast to Cape St. Augustine; where meeting with

so further hindrance, it again falls in with the general trade-wind, and is carried along with it in its proper direction.

We have purposely omitted mentioning the winds on the west coasts of Africa and America till the others were explained, as the causes of the peculiarities here observed will be now more easily comprehended. On the coasts of Chili and Peru, in America, from 25° or 30° of south latitude to the line; and on the parallel coast of Angola, &c. in Africa; the wind blows all the year from the south, varying in its direction a little in different places according to the direction of the coast, towards which it always inclines a little. But whatever is the direction at any one place, it continues the same throughout the whole year without any variation, and always blows from some southerly point. But there is this difference between this wind upon the coasts of Chili and Angola, that it extends much further out to sea upon the former than upon the latter.

In order to explain the cause of this singular phenomenon, it is necessary to recollect, that the general trade wind is produced by the concurrence of two separate causes. One is the great heat of the equatorial region, by which alone would be produced a constant north or south wind. The other is the diurnal revolution of the earth, which would cause a perpetual tendency of the air in these warm regions from east to west. From the concurrence of these two causes result the general trade-wind, which would constantly blow from the S. E. or N. E. as we have already demonstrated. But if any one of these two causes, in any particular place, is prevented from producing its full effect, while the other continues to exert its influence, the general direction of the wind will be varied, and it will assume another. Thus, if the east wind was prevented from acting in any particular place, while nothing interrupted the south or north wind, it is evident that the air would rush towards the equator in that direction which was nearest and easiest, whether that should be pointing eastward or westward. Now as the high mountains in the internal parts of Africa and America interrupt the course of the east wind near the surface of the earth, while these coasts of which we now treat are entirely open to the south, the wind naturally rushes along the coasts of Chili and Angola from north to south; and as the low lands near the shore, in these warm regions, is generally warmer than the sea, the wind will naturally point in towards the shore, as is generally observed to happen.

This, then, is the obvious cause of the south wind which always prevails upon the coasts of Chili and Peru, as well as along the shores of Angola, Loango, &c. But it is only near the shore that this can take place; nor can it extend to a great height above these low and fertile regions. For as the internal parts of these countries are exceedingly high, but more especially the Andes of America, which experience a perpetual degree of cold more intense than some polar regions ever experience; the air must here be condensed to a very great degree, and send forth from these high regions a perpetual wind to every side, which occasions almost all the peculiarities that have been remarked in these climates: for by opposing the general current of the trade-wind upon the eastern part of these continents, they produce these deluges of rain which supply the immense rivers of the Amazons, La Plata, &c.; these do not, like the Nile and Gambia, swell only at a particular season, and then shrink into a diminutive size again; but continue throughout the whole year, with less variation of size, to pour their immense floods of water into the ocean. These cold winds likewise stretch to the westward, at a considerable distance above the warmer regions of the sea-coast, at length descend as low as the ocean, and form

the general trade-wind, and occasion that unusual degree of cold which mariners have so often complained of even under the line, to the westward of America. To the same cause also must we attribute the thick fogs so common upon the southern parts of Chili, and along the coasts of Peru, with the other peculiarities of that singular climate about Lima and the kingdom of Valles in South America; for the vapours which are exhaled in such great abundance in the warm regions on the sea-shore, are, at a little height above the earth, condensed by the cold winds which come from the mountains, and form those thick mists which are so often observed in this climate. The same effects are felt in some degree on the similar coast of Africa. But as the mountains of Africa are not so high as the Andes of America, nor approach so near the western coast, the effects are less sensible here than in America. The great height of the Andes above the mountains of the similarly situated country of Africa, is the only reason why the effects on that coast are not felt to an equal degree, although similar in kind.

A more singular deviation from the general trade-wind is observed to take place on the African and American coasts to the north of the line, than those we have taken notice of to the south of it. For it is observed, that from California to the bay of Panama, all along the coasts of New Spain, the winds blow almost constantly from the west or S. W. nearly directly opposite to the trade-wind; and on the coast of Africa from Cape Bayador to Cape Verde, they blow chiefly from the N. W. standing in upon the shore; from thence the wind bends gradually more and more from the north to the west, and so round to the S. W. all along the coast of Guinea, as will be distinctly seen by the map. After what we have said of the winds on the southern parts of these regions, it will be unnecessary to spend much time in explaining the cause of these peculiarities, as it will evidently appear that they are nearly the same, the variations here observed being occasioned by the particular direction of the coast.—Thus, along the coast of New Spain, the wind blows nearly the same direction in every place, as there are no remarkable bendings on the coast; being uniformly drawn towards the shore by the great heat of the low part of the continent near the sea, which in these regions is always more heated than the water of the ocean, and occasions that inflection. But as the coast of Africa is more irregular, the winds also are found to be more different in their direction. To the north of Cape Verde, as the coast stretches nearly south and north, the wind, being drawn towards it a little, blows from the N. W. But beyond that, the coast bends more eastward to Cape Palmas; from which it runs E. or N. E. all along the coast of Guinea, the wind shifting gradually more and more to the west, still pointing in upon the coast. And as there is nothing to oppose the current of air, which comes from the south along the coast of Angola, it stretches forward till it comes within the influence of the coast of Guinea, and is there drawn in towards the shore in a S. W. direction. But as it is only the lower regions of the coast of Guinea, which are so much warmed, the high mountains within continuing cold; the northerly wind coming from these meeting and opposing the southerly winds in the higher regions of the air, by their mutual conflicts occasion those incessant rains and tremendous thunder so remarkable along the whole of this uncomfortable coast.

It has been often observed by mariners, that there is a track of sea to the west of Guinea from five to ten degrees of north latitude, in which the trade-wind blows with less steadiness than in any other part of that ocean, being almost constantly troubled with calms and tornadoes; the cause

of which the reader will perceive by inspecting the map, as he will easily see that the winds are drawn from this quarter almost in every direction: so that there can be here no constant wind; but being exhausted of its air, it must become lighter than the circumjacent parts, and must then be supplied from either side, as chance or occasional circumstances may direct, which occasion those sudden flurries and tornadoes here observed.

Before we take leave of this subject, it is necessary to observe, that in the bay of Panama the winds between September and March are easterly; but from March till September they blow chiefly from the S. S. W. that is, during the winter months, while the sun is far from them, the winds are off shore; and during the summer months, the land being heated to a considerable degree, they are drawn towards the shore as usual. It is remarkable, however, that this is the only part on the west of a large continent, where the wind shifts regularly at different seasons; which seems to be occasioned by the great height of the isthmus of Darien, and the Terra Firma to the east of it, and the nearness of these to the sea, in comparison of the mountains near Benin on the similarly situated coast of Africa; which is greatly assisted by the deepness of the bay, which, by bending so much to the eastward from Cape Lorenzo, is in a great measure screened from the force of the fourth winds, which allows the winter breeze to extend itself upon the bay with more facility. We ought here also to remark, that along the coast of Mexico, between Cape Pelanco and Guatimala, there are land-winds which blow in the months of May, June, and July, called by the Spaniards *Popogaios*. They greatly resemble the Summatenta winds in the bay of Campeachy, as they blow both night and day a moderate breeze without intermission, sometimes three or four days or a week together. But as these blow from the land in summer only, whereas the Summatentas blow only in winter, they must be occasioned by a different cause, which seems to be this: as the continent which divides the South Sea from the bay of Mexico and gulph of Honduras, is but of very small breadth, and in many places very high ground, the heat which it receives from the sun in summer is not so great as on the similar coast of Africa; and as the trade-wind coming from the great Atlantic ocean sweeps along the eastern part of the American coast from Cape St. Augustine to the bay of Honduras with very great violence at that season, the small heat of this narrow continent is not sufficient to stop it entirely during that season; so that at some times it blows for a short time quite across it, and occasions those winds called *Popogaios*.

Besides these more general winds, there are likewise some particular winds which are only felt in particular places at certain times, whose effects are so singular as to merit attention; some of which we shall here take notice of. In the gulph of Persia, particularly at Ormuz, during the months of June and July, there sometimes blows from the west, for a day or two together, a hot suffocating fiery wind, which scorches up and destroys any animal that may be exposed to it; for which reason, almost every body leave their habitations at Ormuz during these two months, and retire to the mountains near Schiras in Persia, where they enjoy a more comfortable climate. To explain the cause of which, it is necessary to observe, that along all the coasts of Asia, to the north of the Indian ocean, the diurnal sea and land breezes take place, as in every part of the torrid zone; by means of which the monsoons are not felt close in upon the shores: But as the monsoon continues to blow regularly at a small distance from shore, so in all probability it continues its course without interruption at a small distance above the surface of the earth. Now when the monsoon is in its greatest vigour, its influence

will sometimes descend even as low as the surface of the earth, and, interrupting the course of the breezes, hurry along with it these warm vapours, which ought to have ascended upwards, and produced the salutary sea-breeze; and as the earth is thus deprived of the refreshing influence and moisture of the sea-breeze, the air, by the strong reverberation of the sun-beams from such dry and sandy countries as Arabia, must soon be heated to an amazing degree, and produce these hot and suffocating winds. It is also remarkable, that these hot winds are more often experienced near headlands, where the sea-breezes are weakest, which seems to confirm this hypothesis.—Winds similar to these in kind, though not in degree, are felt upon the coast of Coromandel during the months of June, July, and August, while the west monsoon reigns; and on the Malabar coast they are likewise felt in the months of December and January, while the east monsoon reigns; but these are much less powerful than either of the others. As these hot winds always come from the land, they are known upon these coasts by the name of *Terenos*.

It has likewise been observed, that on the coast of Africa to the north of Cape Verde, during the months of December, January, and February, there sometimes blows, for a day or two together, an easterly wind, so very intensely cold as to be almost as destructive as the warm winds at Ormuz. We have already in some measure explained the cause of this phenomenon.—During these months, when the sun is far from them, his influence is less felt than at other seasons, and the northerly wind upon the coast is of course weakened, inasmuch that the cold produced by the mountains in the heart of the country being now in its greatest degree of force, bursts its usual confinement for a time, spreading to the west with great violence, and producing those uncommon effects already mentioned. Those who sail on these coasts, distinguish this particular wind by the name of *Hamattan*.

These are the principal winds, whether constant or periodical, that take place within the tropics; and thus simple are their causes.

The succession of sea and land breezes renders the torrid zone not only habitable but comfortable. Besides, as these currents of cold air, rushing from each side of the globe, and carrying along with them vast quantities of aqueous vapours which they collect from the surface of the earth in their course, meet and oppose one another at that part of the atmosphere where the influence of the sun is greatest at the time, the water is there forced from the clouds in such prodigious quantities, as to produce a diversity of seasons in the torrid zone, something similar to what is experienced in more temperate climates; with this difference, however, that whereas, in temperate climates, the warmest and most comfortable season is when the sun approaches nearest perpendicular to them, in these warmer climates the heavy rains which fall upon them at that season moderates the heat, and prevents the sun from having such an effect as at other times; so that their coldest and most inconstant weather, which they call *winter*, is at that season, when, without this cause, they would be exposed to the sun's most powerful influence.

We shall only take notice of one other instance of the happy effects produced on our globe by the laws of nature with respect to winds. We have seen, that in the great Atlantic and Pacific oceans, the trade-wind blows constantly from the easterly points throughout the whole year, so that ships sail from east to west within the tropics with the utmost facility; but it is absolutely impossible in these seas to sail from west to east, as the wind would be constantly against them; so that ships bound for any port to the eastward in these regions, must stand to the north or south till they are beyond the limits of the trade-winds, where they meet with variable breezes, by

the help of which they fail to the eastward. But if the same constant trade-wind had taken place in the northern part of the Indian ocean, it would have been impossible to have failed to the eastward at all; because the continent of Asia would have prevented the ships from sailing far enough north to find the variable winds. But here, as in almost every case in which the operations of nature are concerned, we find, that what produceth the disease, at the same time furnisheth a remedy; for that very continent which would have stood in our way going northward, draws the wind towards itself at one season, which makes that course of navigation unnecessary, the shifting of the monsoons supplying a nearer and more commodious course. Thus we see, that wherever the sea is open to the south or north, near the tropics, so as that ships are at freedom to reach the variable winds, the trade-wind constantly blows in one direction; but wherever there is any extent of continent within the verge of the torrid zone, so as that they could not be at liberty to reach the variable winds, there the course of the trade-wind is altered, being drawn towards it in summer, and from it in winter, forming that shifting wind called *monsoons*. From which we may naturally infer, that as there are no monsoons in the Pacific or Atlantic, or in the western part of the Indian ocean, to the south of the line, there are no extensive continents near the tropics in either of these places.

Hot Winds. See SAMIEL.

Wind-Flower. See ANEMONY.

Wind-Mill. a kind of mill, the internal parts of which are much the same with those of a water-mill: from which, however, it differs, in being moved by the impulse of the wind upon its sails or vanes, which are to be considered as a wheel in axis. See MECHANICS.

Wind-Gage. See *Wind-GAGE*.

Wind-Galls in farriery. See FARRIERY.

Wind-Gun. See AIR-GUN.

Instruments for measuring the strength, velocity, &c. of the Wind. See *Wind-GAGE*, ANEMOMETER, and ANEMOSCOPE.

Wind-Hatch, in mining, a term used to express the place at which the ore is taken out of the mines.

Wind-Shock, a name given by our farmers to a distemper to which fruit-trees, and sometimes timber-trees, are subject. It is a sort of bruise and shiver throughout the whole substance of the tree; but the bark being often not affected by it, it is not seen on the outside, while the inside is twisted round, and greatly injured. It is by some supposed to be occasioned by high winds; but others attribute it to lightning. Those trees are most usually affected by it whose boughs grow more out on one side than on the other. The best way of preventing this in valuable trees, is to take care in the plantation that they are sheltered well, and to cut them frequently in a regular manner while young.

Wind-Taught, in sea-language, denotes the same as stiff in the wind. Too much rigging, high masts, or any thing catching or holding wind aloft, is said to hold a ship wind-taught; by which they mean, that the stoops too much in her sailing in a stiff gale of wind. Again, when a ship rides in a main stress of wind and weather, they strike down her top-masts, and bring her yards down, which else would hold too much wind, or be too much distended and wind-taught.

Wind-Sails, a sort of wide tube or funnel of canvas, employed to convey a stream of fresh air downward into the lower apartments of a ship. This machine is usually extended by large hoops situated in different parts of its height. It is let down perpendicularly through the hatches, being expanded at the lower end like the base of a cone; and having its upper side open on the side which is placed to windward, so as to

receive the full current of wind; which entering the cavity, fills the tube, and rushes downwards into the lower regions of the ship. There are generally three or four of these in our capital ships of war, which, together with the ventilators, contribute greatly to preserve the health of the crew.

WINDAGE of a Gun, is the difference between the diameter of the bore and the diameter of the ball.

WINDLASS, a machine used for raising huge weights, as guns, stones, anchors, &c. It is very simple, consisting only of an axis or roller, supported horizontally at the two ends by two pieces of wood and a pulley; the two pieces of wood meet at top, being placed diagonally so as to prop each other; the axis or roller goes through the two pieces, and turns in them. The pulley is fastened at top where the pieces join. Lastly, there are two staves or handspikes which go through the roller, whereby it is turned, and the rope which comes over the pulley is wound off and on the same.

WINDLASS, in a ship, is an instrument in small ships, placed upon the deck, just abaft the fore-mast. It is made of a piece of timber six or eight feet square, in form of an axle-tree, whose length is placed horizontally upon two pieces of wood at the ends thereof, and upon which it is turned about by the help of handspikes put into holes made for that purpose. This instrument serves for weighing anchors, or hoisting of any weight in or out of the ship, and will purchase much more than any capitan, and that without any danger to those that heave; for if in heaving the windlafs about, any of the handspikes should happen to break, the windlafs would fall of itself.

WINDOW, an aperture or open place in the wall of a house to let in the light. See ARCHITECTURE. The word is Welch, *mynt dor*, signifying the passage for the wind. Window is yet provincially denominated *windor* in Lancashire; i. e. *wind door*, or the passage for air, as that for people was peculiarly called the *door*. Before the use of glass became general, which was not till towards the end of the 12th century, the windows in Britain seem generally to have been composed of paper. Properly prepared with oil, this forms no contemptible defence against the intrusions of the weather, and makes no incompetent opening for the admission of the light. It is still used by our architects for the temporary windows of unfinished houses, and not unfrequently for the regular ones of our work-shops. But some of the principal buildings we may reasonably suppose to have been windowed in a superior manner. They could, however, be furnished merely with lattices of wood or sheets of linen, as these two remained the only furniture of our cathedrals nearly to the eighth century; and the lattices continued in some of the meaner towns of Lancashire to the 18th; and in many districts of Wales, and many of the adjoining parts of England, are in use even to the present moment. These seem all to have been fixed in frames that were called *casements*, and now therefore *casements* in Wales and Lancashire.

WINDSOR, a borough-town of Berkshire, twenty-two miles west of London, most remarkable for the magnificent palace or castle situated there on an eminence, which commands the adjacent country for many miles, the river Thames running at the foot of the hill. The knights of the garter are installed in the royal chapel here. It sends two members to parliament. W. Long. o. 36. N. Lat. 51. 30.

WINDWARD, in the sea language, denotes any thing towards that point from whence the wind blows, in respect of a ship: thus windward-tide, is the tide which runs against the wind.

WINE, a brisk, agreeable, spirituous, and cordial liquor, drawn from vegetable bodies, and fermented. All sorts of vegetables, fruits, seeds, roots, &c. afford wine; as grapes,

currants, mulberries, alder-berries, cherries, apples, pulse, beans, pease, turneps, radishes, and even grafts itself. Hence under the class of wines, or vinous liquors, come not only wines absolutely so called, but also ale, cyder, &c.

Wine in France is distinguished, from the several degrees and steps of its preparation, into, 1. *Mere goutte*, mother-drop, which is the virgin wine, or that which runs of itself out at the top of the vat wherein the grapes are laid, before the vintager enters to tread or stamp the grapes. 2. *Muft*, *formuft*, or *flum*, which is the wine or liquor in the vat, after the grapes have been trod or stamped. 3. *Pressed wine*, being that squeezed with a press out of the grapes half bruised by the treading. The husks left of the grapes are called *rope*, *mark*, or *mark*; by throwing water upon which, and pressing them afresh, they make a liquor for servants use, answerable to our cyderkin, and called *boisson*. 4. *Sweet wine*, is that which has not yet worked nor fermented. 5. *Bouru*, that which has been prevented working by casting in cold water. 6. *Worked wine*, that which has been let work in the vat, to give it a colour. 7. *Boiled wine*, that which has had a boiling before it worked, and which by that means still retains its native sweetness. 8. *Strained wine*, that made by sleeping dry grapes in water, and letting it ferment of itself. Wines are also distinguished with regard to their colour into white wine, red wine, claret wine, pale wine, rose, or black wine; and with regard to their country, or the soil that produces them, into French wines, Spanish wines, Rhenish wines, Hungarian wines, Greek wines, Canary wines, &c. and more particularly into Port wine, Madeira wine, Burgundy wine, Champain wine, Falernian wine, Tockay wine, Schiras wine, &c.

Method of Making, Fining, &c. WINE. In the southern parts of France, their way is with red wines to tread or squeeze the grapes between the hands, and to let the whole stand, juice and husks, till the tincture be to their liking; after which they press it. But for white wines, they press the grapes immediately; when pressed, they tun the must and stop up the vessel, only leaving the depth of a foot or more to give room for it to work. At the end of ten days they fill this space with some other proper wine, that will not provoke it to work again. This they repeat from time to time, new wine spending itself a little before it comes to perfection.

The usual method of fining down wines, so as to render them expeditiously bright, clear, and fit for use, is this: Take an ounce of isinglass, beat it into thin threads with a hammer, and dissolve it, by boiling, in a pint of water; this when cold becomes a stiff jelly. Whisk up some of this jelly into a froth with a little of the wine intended to be fined, then stir it well among the rest in the cask, and bung it down tight; by this means the wine will become bright in eight or ten days. This method, however, is found to be best suited to the white wines; for the red ones, the wine-coopers commonly use the whites of eggs beat up to a froth, and mixed in the same manner with their wines.

They fine it down also by putting the shavings of green beech into the vessel, having first taken off all the rind, and boiled them an hour in water to extract their rankness, and afterwards dried them in the sun, or in an oven. A bushel of these serve for a tun of wine; and being mashed, they serve again and again, till almost quite consumed.

For English wine, the method recommended by Mortimer, is first to gather the grapes when very dry, to pick them from the stalks, then to press them, and let the juice stand twenty-four hours in a vat covered. Afterwards to draw it off from the gross lees, and then put it up in a cask, and to add a pint or quart of strong red or white port to every gallon of juice, and let the whole work, bunging it up close, and letting it

stand till January; then bottle it in dry weather. Bradley chooses to have the liquor when pressed, stand with the husks and stalks in the vat, to ferment for fifteen days. The method of converting white wine into red, so much practised by the modern wine-coopers, Dr. Shaw observes is this: Put four ounces of turnsole rags into an earthen vessel, and pour upon them a pint of boiling water; cover the vessel close, and leave it to cool; strain off the liquor, which will be of a fine deep red, inclining to purple. A small portion of this colours a large quantity of wine. This tincture might be either made in brandy, or mixed with it, or else made into a syrup, with sugar, for keeping. A common way with the wine-coopers is to infuse the rags cold in wine for a night or more, and then wring them out with their hands; but the inconvenience of this method is, that it gives the wine a disagreeable taste, or what is commonly called the *taste of the rag*; whence the wines thus coloured usually pass among judges for pressed wines, which have all this taste from the canvas rags in which the lees are pressed. The way of extracting the tincture, as here directed, is not attended with this inconvenience, but it loads the wine with water; and if made into a syrup, or mixed in brandy, it would load the wine with things not wanted, since the colour alone is required. Hence the colouring of wines has always its inconveniences. In those countries which do not produce the tinging grape, which affords a blood-red juice, wherewith the wines of France are often stained, in defect of this, the juice of alder-berries is used, and sometimes logwood is used at Oporto.

The colour afforded by the method here proposed, gives wine the tinge of the Bourdeaux red, not the port; whence the foreign coopers are often distressed for want of a proper colouring for red wines in bad years. This might perhaps be supplied by an extract made by boiling stick-lack in water. The skins of tinging grapes might also be used, and the matter of the turnsole procured in a solid form, not imbibed in rags.

Stahl observes, that it is a common accident, and a disease in wines, to be kept too hot; which is not easy to cure when it has been of any long continuance, otherwise it may be cured by introducing a small artificial fermentation, that new ranges the parts of the wine, or rather recovers their former texture: but the actual exposing of wine to the fire, or the sun, presently disposes it to turn eager; and the making it boiling hot, is one of the quickest ways of expediting the process of making of vinegar.

On the other hand, wine kept in a cool vault, and well secured from the external air, will preserve its texture entire in all the constituent parts, and sufficiently strong for many years, as appears not only from old wines, but other foreign fermented liquors, particularly those of China, prepared from a decoction of rice; which being well closed down in a vessel, and buried deep under ground, will continue for a long series of years rich, generous, and good, as the histories of that country universally agree in assuring us.

The most general remedy hitherto known for all the diseases of wines, is a prudent use of tartarized spirit of wine, which not only enriches, but disposes all ordinary wines to grow fine.

If either by fraud or accident a larger portion of water is mixed with wine than is proper for its consistence, and no way necessary or essential, this superfluous water does not only deprave the taste, and spoil the excellence of the wine, but also renders it less durable; for humidity in general, and much more a superfluous aqueous humidity, is the primary and restless instrument of all the changes that are brought on by fermentation. It may doubtless therefore be useful, and sometimes absolutely necessary, to take away this superfluous

water from the other part which strictly and properly constitutes the wine. This has been agreed upon all hands as a thing proper, but the manner of doing it has not been well agreed on: some have proposed the effecting it by means of heat and evaporation, others by percolation, and others by various other methods, all found unsuccessful when brought to the trial; but the way proposed by Dr. Shaw from Stahl, is the most certain and commodious; this is done by a concentration of the wine, not by means of heat, but of cold.

If any kind of wine, but particularly such as has never been adulterated, be in a sufficient quantity, as that of a gallon or more, exposed to a sufficient degree of cold in frosty weather, or be put into any place where ice continues all the year, as in our ice-houses, and there suffered to freeze, the superfluous water that was originally contained in the wine will be frozen into ice, and will leave the proper and truly essential part of the wine unfrozen, unless the degree of cold should be very intense, or the wine but weak and poor. This is the principle on which Stahl founds his whole system of condensing wines by cold. When the frost is moderate, the experiment has no difficulty, because not above a third or a fourth part of the superfluous water will be froze in a whole night; but if the cold be very intense, the best way is, at the end of a few hours when a tolerable quantity of ice is formed, to pour out the remaining fluid liquor, and set it in another vessel to freeze again by itself. If the vessel, that thus by degrees receives the several parcels of the condensed wine, be suffered to stand in the cold freezing place where the operation is performed, the quantity lying thin in the pouring out, or otherwise, will be very apt to freeze anew; and if it be set in a warm place, some of this aqueous part thaws again, and so weakens the rest. The condensed wine therefore should be emptied in some place of a moderate degree as to cold or heat, where neither the ice may dissolve, nor the vinous substance mixed among it be congealed. But the best expedient of all is to perform the operation with a large quantity of wine, or that of several gallons, where the utmost exactness, or the danger of a trifling waste, need not be regarded.

By this method, when properly performed, there first freezes about one third part of the whole liquor; and this is properly the more purely aqueous part of it, inasmuch that when all the vinous fluid is poured off to be again exposed to a concentration, the ice remaining behind from this first freezing being set to thaw in a warm place, dissolves into a pure and tasteless water. The frozen part, or ice, consists only of the watery part of the wine, and may be thrown away, and the liquid part retains all the strength, and is to be preserved. This will never grow sour, musty, or mouldy afterwards, and may at any time be reduced to wine of the common kind again, by adding to it as much water as will make it up to the quantity that it was before.

Wines in general may by this method be reduced to any degree of vinosity or perfection.

The benefit and advantage of this method of congelation, if reduced to practice in the large way in the wine countries, must be evident to every body. Concentrated wines in this manner might be sent into foreign countries instead of wine and water, which is what is usually now sent, the wines they export being loaded, and in danger of being spoiled, by three or four times their own quantity of unnecessary, superfluous, and prejudicial water.

An easy method of recovering pricked wines may be learned from the following experiment: Take a bottle of red port that is pricked, add to it half an ounce of tartarized spirit of wine, shake the liquor well together, and set it by for a few days, and it will be found very remarkably altered for the better.

This experiment depends upon the useful doctrine of acids and alkalies. All perfect wines have naturally some acidity, and when this acidity prevails too much, the wine is said to be pricked, which is truly a state of the wine tending to vinegar: but the introduction of a fine alkaline salt, such as that of tartar, imbibed by spirit of wine, has a direct power of taking off the acidity, and the spirit of wine also contributes to this, as a great preservative in general of wines. If this operation be dexterously performed, pricked wines may be absolutely recovered by it, and remain saleable for some time; and the same method may be used to malt liquors just turned sour.

The age of wine is properly reckoned by leaves; thus they say wine of two, four, or six leaves, to signify wine of two, four, or six years old; taking each new leaf put forth by the vine since the wine was made for a year.

WINE is also a denomination applied in medicine and pharmacy to divers mixtures and compositions, wherein the juice of the grape is a principal ingredient. See the article VINUM.

With regard to the medical uses of wines, it is observed, that among the great variety of wines in common use among us, five are employed in the shops as menstrua for medicinal simples; that is, the *vinum album hispanicum*, or Mountain wine; the *vinum album gallicum*, or French white wine; the Canary wine, or sack, the Rhenish wine, and the red port. The effects of these liquors on the human body are, to cheer the spirits, warm the habit, promote perspiration, render the vessels full and turgid, raise the pulse, and quicken the circulation. The effects of the full-bodied wines are much more durable than those of the thinner: all sweet wines, as Canary, abound with a glutinous, nutritious substance, whilst the others are not nutritive, or only accidentally so, by strengthening the organs employed in digestion. Sweet wines, in general, do not pass off freely by urine; and they heat the constitution more than an equal quantity of any other, though containing full as much spirit: red port, and most of the red wines, have an astringent quality, by which they strengthen the tone of the stomach, and thus prove serviceable for restraining immoderate secretions; those which are of an acid nature, as Rhenish, pass freely by the kidneys, and gently loosen the belly. It is supposed that these last exasperate and occasion gouty calculous disorders, and that new wines of every kind have this effect.

WINE Press, a machine used for squeezing the juice out of grapes, and consisting of several pieces of timber, variously disposed, which compose three bodies of timber-work, closely united to the axis, which serves as a swing whereby it may be moved by the vice. Of these there are different sizes as well as different constructions; for an account of which, illustrated by figures, see Miller's Gardener's Dictionary, article WINE Press.

Spirit of WINE, or *alcohol*, a name given by chemists to every ardent spirit produced by distillation. See CHEMISTRY Index.

WING, that part of a bird, insect, &c. whereby it is enabled to fly. See BIRD and ORNITHOLOGY.

WINGS, in military affairs, are the two flanks or extremes of an army, ranged in form of a battle; being the right and left sides thereof.

WINTER, one of the four seasons or quarters of the year. See SEASON, &c. Winter commences on the day when the sun's distance from the zenith of the place is greatest, and ends on the day when its distance is at a mean between the greatest and least. Under the equator, the winter as well as other seasons return twice every year; but all other places have only one winter in the year; which in the northern hemi-

WINTERA Aromatica.

sphere begins when the sun is in the tropic of Capricorn, and in the southern hemisphere when in the tropic of Cancer; so that all places in the same hemisphere have their winter at the same time.

WINTER-Berry. See *PHYSALIS*.

WINTERA, in botany: a genus of plants of the class of *polyandria*, and order of *pentagynia*; and in the natural system arranged under the 12th order, *Holocarpeæ*. The calyx is three-lobed; there are six or twelve petals; there is no style; the fruit is a berry, which is club-shaped as well as the germin. There are two species; the *aromatica* and *granadensis*.

WINTERA *aromatica*, is one of the largest forest-trees upon Terra del Fuego; it often rises to the height of 50 feet. Its outward bark is on the trunk grey and very little wrinkled, on the branches quite smooth and green. The branches do not spread horizontally, but are bent upwards, and form an elegant head of an oval shape. The leaves come out, without order, of an oval elliptic shape, quite entire, obtuse, flat, smooth, shining, of a thick leathery substance, evergreen, on the upper side of a lively deep green colour, and of a pale bluish colour underneath, without any nerves, and their veins scarcely visible; they are somewhat narrower near the footstalks, and there their margins are bent downwards. In general, the leaves are from three to four inches long, and between one and two broad; they have very short footstalks, seldom half an inch long, which are smooth, concave on the upper side, and convex underneath. From the scars of the old footstalks the branches are often tuberculated.

The peduncles, or footstalks for the flowers, come out of the *axilla foliorum*, near the extremity of the branches; they are flat, of a pale colour, twice or three times shorter than the leaves; now and then they support only one flower, but are oftener near the top divided into three short branches, each with one flower. The bractæ are oblong, pointed, concave, entire, thick, whitish, and situated one at the basis of each peduncle.

There is no calyx; but in its place the flower is surrounded with a spathaceous gem, of a thick leathery substance, green, but reddish on the side which has faced the sun: before this gem bursts, it is of a round form, and its size is that of a small pea. It bursts commonly so, that one side is higher than the other, and the segments are pointed. The corolla consists always of seven petals, which are oval, obtuse, concave, erect, white, have small veins, and are of an unequal size, the largest scarcely four lines long; they very soon fade, and drop off almost as soon as the gem bursts. The filaments are from 15 to 30, and are placed on the flat end side of the receptacle; they are much shorter than the petals, and gradually decrease in length towards the sides. The antheræ are large, oval, longitudinally divided into two, or as if each was made up of two oblong antheræ. The germina are from three to six, placed above the receptacle, turbinate, or of the shape of an inverted fig; flat on the inside, and somewhat higher than the stamina; they have no styles, but terminate in a stigma, which is divided into two or three small lobes.

Dr. Solander, to whom the world is indebted for the description, never saw the fruit in its perfectly ripe state; but could conclude from the unripe fruit which he saw in abundance, that each germin becomes a separate seed-vessel, of a thick fleshy substance, and unilocular; and in each the rudiments of three, four, or five seeds were plainly discernible. See Plate VIII. where N° 1. represents the spathaceous gem, after it is burst open. 2. The fame. 3. The fame (a) with the corolla (b) remaining within it. 4. One of the petals spread out. 5. The stamina (a) and the pistilla (b) after the gem and the corolla are taken away. 6. The outside of an anthera (a) with its filament (b). 7. The inside of the same,

Vol. X.

8. The germina (a) situated on the centre of the receptacles after the stamina have been removed; the lobated stigma (b). 9. The convex or outermost side of a germin (a) with its stigma (b). 10. The inside of the fame. 11. A germin cut open longitudinally, so as to show the rudiments of the seeds. 12. A germin cut through transversely.

The weather is much more severe in the climate where these trees are natives than in Britain; here, therefore, it is thought they would thrive very well.

The bark of the wintera, or winter's cinnamon, brought over by the Dolphin, in respect to figure, exactly resembles that which was delineated by Clusius. The pieces are about three or four inches square, of different degrees of thickness, from a quarter to three quarters of an inch. It is of a dark brown cinnamon colour; an aromatic smell, if rubbed; and of a pungent hot spicy taste, which is lasting on the palate, though imparted slowly. It has the name of *winter's cinnamon*, from a faint resemblance in colour and flavour to that grateful aromatic, though differing from it greatly in every other respect. This bark is only brought to us from the Straits of Magellan, and is the produce of the tree above described; much celebrated as an antiscorbutic by the first discoverers, but unknown in the practice of physic, no quantity, except as a curiosity, having been brought to Europe till the return of the ships sent out on the expeditions to the South Seas. The bark which was substituted in the room of this is the canella alba of the shops. See *CANELLA*.

From several experiments made by Dr. Morris, the cortex magellanica appears to be of an astringent of a particular kind, and therefore likely to be of use in several manufactures. Water is the proper solvent of this bark; though the saline, gummy, and resinous parts are so blended in it, as in saffron and some other vegetables, that it parts with them readily in proof and rectified spirits of wine, though not in so great a quantity.

The infusion and decoction of this bark were of so grateful an aromatic bitter taste, that it seems likely to be a pleasant vehicle for some of the nauseous drugs. With this view, on substituting the powder of this bark for the cardamom seeds in making the infusion of senna, as directed in the London Dispensatory, the nauseous smell and taste of that excellent purgative was so effectually covered, as to be scarcely distinguished by the nicest palate. Tincture of rhubarb also prepared with this bark instead of cardamoms seemed far less disagreeable.

WIRE, a piece of metal drawn through the hole of an iron into a thread of a fineness answerable to the hole it passed through. Wires are frequently drawn so fine as to be wrought along with other threads of silk, wool, flax, &c. The metals most commonly drawn into wire are gold, silver, copper, and iron. Gold-wire is made of cylindrical ingots of silver, covered over with a skin of gold, and thus drawn successively through a vast number of holes, each smaller and smaller, till at last it is brought to a fineness not exceeding that of a hair. That admirable ductility which makes one of the distinguishing characters of gold, is no where more conspicuous than in this gilt wire. A cylinder of 48 ounces of silver, covered with a coat of gold, only weighing one ounce, as Dr. Halley informs us, is usually drawn into a wire, two yards of which weigh no more than one grain; whence 98 yards of the wire weigh no more than 49 grains, and one single grain of gold covers the 98 yards; so that the ten thousandth part of a grain is above one-eighth of an inch long.

WIRE of Lapland. The inhabitants of Lapland have a sort of shining slender substance in use among them on several occasions, which is much of the thickness and appearance of our silver-wire, and is therefore called, by those who do not ex-

examine its structure or substance, *Lapland wire*. It is made of the sinews of the rein deer, which being carefully separated in the eating, are, by the women, after soaking in water and beating, spun into a sort of thread, of admirable fineness and strength, when wrought to the smallest filaments; but when larger, is very strong, and fit for the purposes of strength and force. Their wire, as it is called, is made of the finest of these threads covered with tin. The women do this business; and the way they take is to melt a piece of tin, and placing at the edge of it a horn, with a hole through it, they draw these sinewy threads, covered with the tin, through the hole, which prevents their coming out too thickly covered. This drawing is performed with their teeth; and there is a small piece of bone placed at the top of the hole, where the wire is made flat; so that we always find it rounded on all sides but one, where it is flat. This wire they use in embroidering their clothes as we do gold and silver; they often sell it to strangers, under the notion of its having certain magical virtues.

WISDOM, usually denotes a higher and more refined notion of things immediately presented to the mind, as it were, by intuition, without the assistance of ratiocination. Sometimes the word is more immediately used, in a moral sense, for what we call *prudence*, or *discretion*, which consists in the soundness of the judgment, and a conduct answerable thereto.

WISDOM of Solomon, one of the books of the Apocrypha. It abounds with Platonic language, and was probably written after the Chaballistic philosophy was introduced among the Jews.

WIT, is a quality of certain thoughts and expressions, much easier perceived than defined. According to Mr. Locke, wit lies in the assemblage of ideas, and putting those together with quickness and variety, wherein can be found any resemblance or congruity, thereby to make up pleasant pictures and agreeable visions to the fancy. Mr. Addison limited this definition considerably, by observing, that every resemblance of ideas does not constitute wit, but those only which produce delight and surprise. Mr. Pope defined wit to be a quick conception and an easy delivery: while, according to a late writer, it consists in an assimilation of distant ideas.

The word *wit* originally signified *wisdom*. A *witte* was anciently a *wife man*: the *wittenagenot*, or Saxon parliament, an assemblage of wise men. So late as the reign of Elizabeth, a man of pregnant wit, of great wit, was a man of vast judgment. We still say, *in his wits*, *out of his wits*, for in or out of sound mind. The word, however, is now applied in a more limited sense.

Without attempting to expose the inaccuracy of the definitions above mentioned, or hazarding a definition of our own where so many eminent men have failed, we shall endeavour to show in what true wit consists.

It is evident that wit excites in the mind an agreeable surprise, and that this is owing entirely to the strange assemblage of related ideas presented to the mind. This end is effected, 1. By debasing things pompous or *seemingly grave*; 2. By aggrandising things little or frivolous; 3. By setting ordinary objects in a particular and uncommon point of view, by means not only remote but apparently contrary. Of so much consequence are surprise and novelty, that nothing is more tasteless, and sometimes disgusting, than a joke that has become stale by frequent repetition. For the same reason, even a pun or happy allusion will appear excellent when thrown out extempore in conversation, which would be deemed execrable in print. In like manner, a witty repartee is infinitely more pleasing than a witty attack: for though, in both cases, the thing may be equally new to the reader or hearer, the effect on him is greatly injured, when there is access to suppose that it may be the slow production of study and premeditation,

This, however, holds most with regard to the inferior tribes of witticisms, of which their readiness is the best recommendation.

WIT (John de), a celebrated pensioner of Holland, and one of the greatest politicians of his time, was the son of Jacob de Wit, burgomaster of Dort, and was born in 1623. He became well skilled in civil law, politics, mathematics, and other sciences; and wrote a treatise on the Elements of Curved Lines, published by Francis Schooten. Having taken his degree of doctor of law, he travelled into foreign courts, where he became esteemed for his genius and prudence. At his return to his native country, in 1650, he became pensionary of Dort, then counsellor-pensionary of Holland and West Friedland, intendant and register of the fiefs, and keeper of the great seal. He was thus at the head of affairs in Holland; but his opposition to the re-establishment of the office of stadtholder, which he thought a violation of the freedom and independence of the republic, cost him his life, when the prince of Orange's party prevailed. He and his brother Cornelius were assassinated by the populace at the Hague in 1674, aged 47.

WITCH, a person guilty of witchcraft.

WITCHCRAFT, a supernatural power which persons were formerly supposed to obtain the possession of by entering into a compact with the devil. See SORCERY.—The belief that certain persons were endowed with this, and that they were assisted by invisible spirits, is very ancient. The *stage* of the Romans seem rather to have been forerunners than witches; indeed the idea of a witch, as above described, could not have been prevalent till after the propagation of Christianity, as the heathens had no knowledge of the Christian devil.

Witchcraft was universally believed in Europe till the 16th century, and even maintained its ground with tolerable firmness till the middle of the seventeenth. Vast numbers of reputed witches were convicted and condemned to be burnt every year. The methods of discovering them were various. One was, to *weigh* the supposed criminal against the *church bible*, which, if the guilty, would preponderate: another, by making her attempt to say the Lord's Prayer; this no witch was able to repeat entirely, but would omit some part or sentence thereof. It is remarkable, that all witches did not hesitate at the same place; some leaving out one part, and some another. Tests, through which the imps sucked, were indubitable marks of a witch: these were always raw, and also insensible; and, if squeezed, sometimes yielded a drop of blood. A witch could not weep more than three tears, and that only out of the left eye. This want of tears was, by the witch-finders, and even by some judges, considered as a very substantial proof of guilt. Swimming a witch was another kind of popular ordeal generally practised: for this she was stripped naked, and cross-bound, the right thumb to the left toe, and the left thumb to the right toe. Thus prepared, she was thrown into a pond or river, in which, if guilty, she could not sink; for having, by her compact with the devil, renounced the benefit of the water of baptism, that element, in its turn, renounced her, and refused to receive her into its bosom. Sir Robert Filmer mentions two others by fire: the first, by burning the thatch of the house of the suspected witch; the other, burning any animal supposed to be bewitched by her, as a hog or ox. These, it was held, would force a witch to confess.

The trial by the stool was another method used for the discovery of witches. It was thus managed: having taken the suspected witch, she was placed in the middle of a room upon a stool or table, cross-legged, or in some other uneasy posture; to which if she submitted not, she was then bound with

cords : there she was watched, and kept without meat or sleep for the space of 24 hours (for, they said, within that time they should see her imp come and suck). A little hole was likewise made in the door for imps to come in at ; and left it should come in some less discernible shape, they that watched were taught to be ever and anon sweeping the room, and, if they saw any spiders or flies, to kill them ; if they could not kill them, then they might be sure they were imps. If witches, under examination or torture, would not confess, all their apparel was changed, and every hair of their body shaven off with a sharp razor, lest they should secrete magical charms to prevent their confessing. Witches were most apt to confess on Fridays.

By such trials as these, and by the accusation of children, old women, and fools, were thousands of unhappy women condemned for witchcraft, and burnt at the stake. In the 15th volume of the Statistical Account of Scotland there is the trial of two witches, William Coke and Allison Dick, in Kirkcaldy, in 1636. The evidence on which they were condemned is absolutely ridiculous : they were, however, burnt for witchcraft. The expenses which the town and kirk-session were put to on this occasion are still upon record, a standing lesson to those who contend for the infallibility of human reason.

The first writers against witchcraft were stigmatized as Atheists, though they only endeavoured to prove the imbecility of the persons accused, and the insatiation or the knavery of their accusers. Such were the epithets bestowed by Dr. Henry More, and even by Cudworth himself. In this country, while the belief in witchcraft was supported by royal authority (for James I. is universally known to have written on demonology) countenanced by Bacon, and generally adopted among the people, only one writer was hardy enough to oppose it. This was Reginald Scott, who published a collection of impostures detected, under the title of *Discoveries of Witchcraft*. James ordered the book to be burnt by the common executioner, and the judges continued to burn witches as usual. During the civil wars, upwards of eighty were hanged in Suffolk, on the accusation of Hopkins the witch-finder. Webster was the next writer against witchcraft ; but he had a different fate from that of Scott, for most of his arguments were refuted by Glanville. This very acute writer was induced to publish his *Philosophical Considerations about Witchcraft*, by the apprehension, that the increasing disbelief of witches and apparitions tended to affect the evidences of religion, and even of a Deity. In respect of argument, he was certainly superior to his adversaries ; his reasoning is perspicuous, though sometimes subtle, rested on the most specious foundations of evidence, and arranged with great skill.

On the continent, this controversy seemed almost forgotten, till Bekker published his *Monde Enchantée*, in which he denied the existence of witches on the Cartesian principle, that the Deity is the source of all action, consequently actions so opposite to his nature and attributes cannot be supposed to exist. He was answered by Frederick Hoffman, the father of the modern theory and practice of medicine, in his dissertation *De Diaboli Potentia in Corpora*.

The latest witchcraft frenzy was in New England, about 1692, when the execution of witches became a calamity more dreadful than the sword or the pestilence. The accusers became so daring, that neither civil nor religious authority would have proved a security against their attacks, if all the prosecutions had not been suddenly dropped, and the prisoners set at liberty. So far did those wretches proceed in absurdity, that a dog was accused of throwing persons into fits by looking at them. As soon as the prosecutions were stopped, all reports of witchcraft ceased.

It would be ridiculous to attempt a serious refutation of the existence of witches ; and at present, luckily, the task is unnecessary. In this country, at least, the discouragement long given to all suspicion of witchcraft, and the repeal of the statutes against that crime, have very much weakened, though perhaps they have not entirely eradicated, the persuasion. On the continent, too, it is evidently on the decline ; and notwithstanding the exertions of Dr. De Haen, and of the celebrated Lavater, we have little doubt but that in a short time posterity will wonder at the credulity of their ancestors. That there ever were witches, is an opinion that cannot for a moment be believed by a thinking man. The actions imputed to them were either absurd or impossible ; the witnesses by whose evidence they were condemned, either weak enthusiasts or downright villains ; and the confessions ascribed to the witches themselves, the effects of a disordered imagination produced by cruel treatment and excessive watchings. As to the nightly meetings, demonologists themselves have been obliged to confess, that they were nothing else but uneasy dreams, often produced by soporific compositions. The facts which have been brought forward by the advocates for witchcraft bear in their front the most evident marks of trick and imposture ; and this has constantly been found out whenever these facts have been properly examined.

WITENA MOT, or WITENA CEMOT, among the Anglo-Saxons, was a term which literally signified the assembly of the wise men ; and was applied to the great council of the nation, of latter days called the *parliament*.

WITHERS of a HORSE, the juncture of the shoulder-bones at the bottom of the neck and mane, towards the upper part of the shoulder. See FARRIER.

WITNESS, in law, a person who gives evidence in any cause, and is sworn to speak the truth, the whole truth, and nothing but the truth.

Trial by WITNESSES, a species of trial without the intervention of a jury. This is the only method of trial known to the civil law, in which the judge is left to form in his own breast his sentence upon the credit of the witnesses examined ; but it is very rarely used in the English law, which prefers the trial by jury before it in almost every instance : save only that when a widow brings a writ of dower, and the tenant pleads that the husband is not dead ; this being looked upon as a dilatory plea, is in favour of the widow, and for greater expedition allowed to be tried by witnesses examined before the judges : and so, faith Finch, shall no other case in our law. But Sir Edward Coke mentions some others ; as, to try whether the tenant in a real action was duly summoned, or the validity of a challenge to a juror : so that Finch's observation must be confined to the trial of direct and not collateral issues. And in every case Sir Edward Coke lays it down, that the affirmative must be proved by two witnesses at the least.

WITSIUS (Herman), a learned and eminent divine of North Holland, born at Enckhuysen in 1626. He was professor of divinity successively at Franeker, Utrecht, and Leyden ; and applied himself successfully to oriental learning, of which his capital work *Egyptiaca* affords sufficient proof. His Economy of the Covenants between God and Men, is warmly recommended by Mr. Hervey in his *Theron and Asaph*. He died in 1708.

WITTENBERG, a city of Germany, capital of the circle of Upper Saxony, 50 miles north of Dresden. It is under immediate vassalage, and the seat of an aulic judicatory, a general superintendency, an inspection, and consistory. The town is not large ; but is well fortified, and contains a famous university, in which Melancthon was a professor. In this place Martin Luther first began to preach against the pope's indulgences ; and in the cathedral of All Saints he is said to

have been buried. In the old citadel of this town the ancient Saxon electors used to reside. Besides the university, there is a Latin school in the town, with six masters. The library belonging to the university is said to be very valuable. In 1756 the Prussians being masters of the town, destroyed a part of its fortifications. E. Long. 12. 47. N. Lat. 51. 49.

WOAD, in botany. See **ISATIS**. The preparation of woad for dying, as practised in France, is minutely described by Astruc, in his *Memoirs for a Natural History of Languedoc*. The plant puts forth at first five or six upright leaves, about a foot long and six inches broad; when these hang downwards and turn yellow, they are fit for gathering: five crops are gathered in one year. The leaves are carried directly to a mill, much resembling the oil or tan mills, and ground into a smooth paste. If this process was deferred for some time, they would putrefy, and send forth an insupportable fench. The paste is laid in heaps, pressed close and smooth, and the blackish crust, which forms on the outside, re-united if it happens to crack: if this was neglected, little worms would be produced in the cracks, and the woad would lose a part of its strength. After lying for fifteen days, the heaps are opened, the crust rubbed and mixed with the inside, and the matter formed into oval balls, which are pressed close and solid in wooden moulds. These are dried upon hurdles: in the sun, they turn black on the outside; in a close place, yellowish, especially if the weather be rainy. The dealers in this commodity prefer the first, though it is said the workmen find no considerable difference betwixt the two. The good balls are distinguished by their being weighty, of an agreeable smell, and, when rubbed, of a violet colour within. For the use of the dyer, these balls require a further preparation: they are beat with wooden mallets, on a brick or stone floor, into a gross powder; which is heaped up in the middle of the room to the height of four feet, a space being left for passing round the sides. The powder, moistened with water, ferments, grows hot, and throws out a thick fetid fume. It is shovelled backwards and forwards, and moistened every day for twelve days; after which it is stirred less frequently, without watering, and at length made into a heap for the dyer.

Woad not only affords a lasting and substantial blue, which, according to the scale of the dyers, may be reduced into many different shades, but is also of great use in dyeing and fixing many other colours. But notwithstanding this, and its being a commodity of our own, the use of it has very much declined since the introduction of indigo; for the purchase of which large sums go annually out of the nation. The reason of this is, that indigo affords a more lively and pleasing colour, is managed with more ease by the dyers, and does their business more expeditiously. Yet with all these advantages, it is universally acknowledged, that the colour which indigo affords is inferior to that of woad in many respects, and particularly in permanency; for which reason, they are frequently used in conjunction; woad to give solidity and substance, and indigo to give brightness and colour. But the worst consequence that has attended the use of indigo is, not barely lessening the consumption, but abating the price and depreciating the intrinsic value of woad; so that less care is taken in the management of it; to which in a great measure the inferiority of its colour, at least in some places, is at present owing. The declension in its consumption is not the case here only, but also in other countries; for it was once the great staple of Languedoc, and was cultivated also in Normandy, and in other provinces of France; as it also is in Spain, Portugal, the Azores, and Canary islands, Switzerland, in the neighbourhood of Geneva, in different parts of Germany, and in Sweden.

An idea has been entertained, that by an alteration in the manner of curing of it, the inconveniences that are supposed

to attend the use of it might be removed, and that woad might be brought to answer all the purposes of indigo; which, if it could be accomplished, would be most certainly a great advantage, and an advantage which every true lover of his country would with should take place here rather than any where else. The author of the *Natural History of Languedoc* suggests, that woad, if cured in the same manner as indigo, might produce as lively a colour; and adds, that from some experiments made by himself, he is convinced the method would effectually answer. The celebrated M. Du Hamel du Monceau informs us, that having proposed to Mr. Fontenelle, a physician in Louisiana, the cultivating the pastel there in the manner of indigo, that gentleman acquainted him, that by treating indigo after the manner of pastel, he had obtained a very beautiful green: which indeed is always the case when the indigo is only allowed to absorb a small quantity of oxygen; for it is now well known that its blue colour is owing to the absorption of that gas.

WOAHOO, one of the Sandwich Islands, lying to the north-west of Morotoi, at the distance of seven leagues. From the appearance of the north-east and north-west parts, it is the finest island of the group. Nothing can exceed the verdure of the hills, the variety of wood and lawn, and rich cultivated valleys, which the whole face of the country displays. A bay is formed by the north and west extremities, into which a fine river empties itself, through a deep valley; but as the water is blackish for 260 yards from the entrance, watering in it is not convenient. It contains about 60,000 inhabitants. Lieutenant Hergeft, commander of the *Ædædus* storeship, who had been sent from England in 1791, to New South Wales, and thence to the Southern Pacific Ocean, with a supply of provisions for the *Discovery* vessel, Captain Vancouver, then on a voyage of discovery, was here surprised and murdered by the natives, together with Mr. Gooch, the astronomer. W. Long. 157. 51. N. Lat. 21. 43.

WODEN. See **ODIN**, and **MYTHOLOGY**.

WODEVILLE (Anthony), earl of Rivers, brother to the queen of Edward IV. was born in the end of 1442, or in the beginning of 1443. Though one of the most accomplished men of his age, very little is known of his private history. He was early and constantly employed either in the tumults of those turbulent times, or in discharging the duties of some of the highest offices of the state, with which he was invested. Yet he found leisure to cultivate letters, and to be the author of works which, though of little value now, made some noise in that age, when learning was at a low ebb in England. These consisted chiefly of translations from the French; and his lordship, with his printer Caxton, were the first English writers who had the pleasure to see their works published from the press. This accomplished, brave, and amiable nobleman was treacherously imprisoned by Richard III. in Pomfret castle, where, during his confinement, he composed a short poem, which has been preserved by John Rous of Warwick, and breathes, says Dr. Henry, a noble spirit of pious resignation to his approaching fate. He was beheaded on the 23d of June, 1483, in the 41st year of his age.

WOLAW, a town in Germany, in Silesia, and capital of a duchy of the same name. It is surrounded with strong walls and a moats, and one part of the houses are built with stone. The castle is also encompassed with deep ditches, and the greatest part of the inhabitants are employed in a woollen manufactory. In 1709 a Protestant church was allowed to be built here. It is seated on the river Oder, 20 miles north-west of Breslau, and 32 south-east of Glogau. E. Long. 16. 54. N. Lat. 51. 18.

WOLD, **WELD**, or **DYERS Weed**. See **RESEDA**.

WOLF, in zoology. See **CANIS**.

WOLF-Fish, or Sea-Wolf. See ANARCHICAS.

WOLF of Woolf Poifon. See POISON.

WOLFE (Major-General JAMES), was the son of Lieutenant-General Edward Wolfe, and was born at Westerham in the county of Kent, where he was baptized the 11th of Jan. 1726. He betook himself, when very young, to the profession of arms; and was soon singled out as a most rising military genius. Even so early as the battle of La-feldt, when scarce twenty, he exerted himself in so masterly a manner, at a very critical juncture, that it drew the highest encomiums from the great officer then at the head of the army. He was early in the most secret consultations for the attack upon Rochfort: and what he would have done there, and what he afterwards did do at Louibourg, are very fresh in every memory. He was scarce returned from thence, when he was appointed to command the important expedition against Quebec. At last, singly, and alone in opinion, he formed, and executed, that great, that dangerous, yet necessary plan, which drew out the French to their defeat, and will for ever denominate him the conqueror of Canada: but when within the grasp of victory, he received a ball through his wrist, but which immediately wrapping up, he went on, with the same alacrity, animating his troops by precept and example: however, in a few minutes after, a second ball, through his body, obliged him to be carried off to a small distance in the rear, and he shortly after expired. He was brought to England, and interred with all military honours in Westminster-abbey, where a magnificent monument is erected over him.

WOLFE (Christian), a celebrated German philosopher, was born at Breilau in 1679. After having been well instructed in the rudiments of learning and science in his own country, Wolfe professed his studies successively in the universities of Jena, Hamburgh, and Leipzig. At the age of twenty-six he had acquired so much distinction, that he was appointed professor of mathematics, and soon afterwards of philosophy in general, in the university of Hall. After Leibnitz had published his *Theodica*, Wolfe, struck with the novelty of the edifice which that philosopher had raised, assiduously laboured in the investigation of new metaphysical truths. He also digested the Elements of Mathematics in a new method, and attempted an improvement of the art of reasoning in a treatise On the Powers of the Human Understanding. Upon the foundation of Leibnitz's doctrine of Monads, he formed a new system of Cosmology and Pneumatology, digested and demonstrated in a mathematical method. This work, entitled *Thoughts on God, the World, and the Human Soul*, was published in the year 1719; to which were added, in a subsequent edition, *Heads of Ethics and Policy*.

Wolfe was now rising towards the summit of philosophical reputation, when the opinion which he entertained on the doctrine of necessity being deemed by his colleagues inimical to religion, and an oration which he delivered in praise of the morality of the Chinese having given much offence, an accusation of heresy was publicly brought against him; and, though he attempted to justify himself in a treatise which he wrote on the subject of fatality, a royal mandate was issued in November, 1723, requiring him to leave the Prussian dominions. Having been formerly invited by the Landgrave of Hesse Cassel to fill a professor's chair in the university of Cassel, Wolfe now put himself under the patronage of that prince, who had the liberality to afford him a secure asylum, and appointed him professor of mathematics and philosophy. The question concerning the grounds of the century which had been passed upon Wolfe was now every-where freely canvassed; almost every German university was inflamed with disputes on the subject of liberty and necessity; and the names of Wolfians and Anti-Wolfians were every-where heard. After an interval of nine

years, the king of Prussia reversed his sentence of exile, and appointed him vice-chancellor of the university of Hall; where his return was welcomed with every expression of triumph. From this time he was employed in completing his Institutes of Philosophy, which he lived to accomplish in every branch except policy. In 1745 he was created a baron by the elector of Bavaria, and succeeded Ladowig in the office of chancellor of the university. He continued to enjoy these honours till the year 1754, when he expired. He possessed a clear and methodical understanding; which by long exercise in mathematical investigations was particularly fitted for the employment of digesting the several branches of knowledge into regular systems; and his fertile powers of invention enabled him to enrich almost every field of science in which he laboured, with some valuable additions. The lucid order which appears in all his writings enables his reader to follow his conceptions with ease and certainty, through the longest trains of reasoning.

WOLFEMBUITTE, a considerable town of Germany, in the circle of Lower Saxony, and duchy of Brunswick, with a castle where the Duke of Brunswick Wolfembutte resides. It is one of the strongest places in Germany, though the fortifications want repairing in several places. There is an excellent library, kept in a building lately erected for that purpose, consisting of 116,000 printed books, and 2000 uncommon books, with a cabinet of curiosities, relating to natural history. It is seated on the river Ocker, five miles south of Brunswick, and 30 west of Halberstadt. E. Long. 10. 42. N. Lat. 52. 18.

WOLFRAM, or TUNGSTEN. See TUNGSTEN.

WOLFRAM, in natural history and chemistry, the name of a peculiar mineral, lately ranged among the semi-metals. See MINERALOGY. This mineral, which the Germans have called *wolfram* or *wolfrath*, a name translated into Latin *spuma lupi*, or rather *lupus Jovis*, has been met with hitherto only in mines of tin; for, though many authors would make it more common, it is an error owing to their confounding some glossy iron ores with the true wolfram, as appears by the specimens which are frequently found in cabinets under this name. It has been, on account of the bad effects produced by this mineral in the smelting of tin-ores, from which it is very difficult to separate it by washing, because of its great specific weight, that the names of *spuma lupi*, *lupus Jovis*, and *wolfram*, have been given to it by the miners and smelters.

This is really a metallic ore, and contains the very semi-metal lately discovered in the tungsten; both being mineralized, or rather formed by the same tungstenic acid. 1. It is of a black or brown shining colour, of a radiated or foliated texture, of a moderate hardness, and sometimes so brittle as to be easily broken between the fingers; but it is very heavy, its specific gravity being ≈ 7.119 . 2. When scratched it shows a red trace, and this distinguishes it from the tungsten (see MINERALOGY), which is a variety of the ore of the same semi-metal. 3. It is found in scattered masses, crystallized into hexadral flat prisms, coming to a point, with four sides, and these points terminated obliquely. 4. Internally it is shining, with the lustre almost of a metal. 5. When it is broken, its texture appears leafy; and the leaves are flat, but somewhat confused. 6. On some sides they are unequal, and very seldom striated. 7. It is always opaque; and when scraped, it yields a powder of a dark reddish grey. 8. The wolfram will not melt by itself with the blow-pipe, the angles being only rounded; but, 9. Internally it preserves its structure and colour without change. 10. With microcosmic salt (*phosphate of ammonia*) it fuses with effervescence; and forms a glass of a pale red in the exterior flame, and much darker in the interior. 11. With borax it

likewise effervesces, and forms by the interior flame a glass of a greenish yellow, which by the exterior turns reddish. 12. Being exposed in a crucible to a strong fire for one hour, it swelled, became spongy, and of a brownish colour; entered into a semi-vitrification; and was attracted by the magnet. 13. Equal parts of nitre and wolfram being put in a red-hot crucible, they detonated, or rather boiled up with a blue flame round the edges, and a nitrous vapour arose; the matter, when cold, on being put into water, partly dissolved; and a few drops of acid produced a white precipitation. 14. Pounded wolfram, digested in a sand heat with a sufficient quantity of marine acid, to the depth of the thickness of a finger above the matter, after one hour's boiling, the powder turned yellow; which is the same phenomenon as happens with the tungstic acid. See CHEMISTRY. 15. It appears by the chemical analysis of wolfram made by Messrs. John and Faust de Luyart, that its contents consist of 22 parts of manganese in the state of black oxyd; 13,5 of iron, 65 of a yellow wolfranic oxyd, and of quartz and tin. 16. A good quantity of this yellow oxyd being collected, it was observed that it was entirely infusible, and that its specific gravity was = 6,120. It effervesces with microcosmic salt; produces a transparent blue colour without any shade of red; and effervesces also with borax and with mineral alkali. This same matter does not dissolve in water; but when triturated with it, forms a kind of emulsion; to which the acetic acid gives a blue colour, but does not dissolve it. This matter, however, dissolves completely in caustic vegetable alkali, both by the dry and moist way; and the liquor acquires a great bitterness. By pouring on it some nitrous acid a precipitate ensues, which leaves on the filter a white salt; and this being well edulcorated, has a taste at first sweet, afterwards sharp and bitter, producing a very disagreeable sensation on the throat. It is in fact a true acid combined with a portion of the alkali and precipitating acid. 17. This acid melts, if alone, by the flame urged with the blow-pipe. 18. This white salt is a true metallic triple salt, as appears by putting 100 grains in a crucible with powdered charcoal; for after one hour and a half of a strong fire, when cooled a button was found, which fell to powder between the fingers. Its colour was brown; and, on examining it with a magnifier, there was a congeries of metallic globules, of the bigness of pins' heads; which, when broken, exhibit the metallic appearance of a steel colour in the fracture; and their specific gravity was = 17,600. 19. These metallic globules, melted with other metals, gold and platinum excepted, afford ductile alloys with silver or copper; and hard ones with cast-iron, tin, antimony, bismuth, and manganese.

It has been supposed that this is a new metal before unknown: that this was evinced, 1. by its specific gravity, equal to 17,600; 2. by the tinges it gives to different glasses; 3. by its great difficulty to fuse, which is greater than that of manganese; 4. by the yellow colour of its calx; 5. its alloys with other metals; 6. its infusibility, at least by a direct method, with mineral acids; 7. its easy solution in alkalis; 8. the emulsion it gives with water; 9. and by the blue colour it gives to acetic acid. We are not certain, however, how far this opinion has been corroborated by later experiments.

WOLFSBERG, a town of Germany, in Lower Carinthia, with a castle, on which the district about it depends, which is 20 miles in length, and 10 in breadth. It is seated on the river Lavand, at the foot of a mountain covered with wood, and full of wolves, from whence the town took its name. It is 36 miles east of Clagenfurt. E. Long. 15. o. N. Lat. 46. 56.

WOLGAST, a pretty considerable town of Germany, in the circle of Upper Saxony, and in Pomerania, capital of a territory of the same name, with a castle, and one of the best

and largest harbours on the Baltic Sea. It is a well-built place, subject to Sweden, and seated on the river Pnin. E. Long. 14. 4. N. Lat. 54. 1.

WOLLASTON (William), descended of an ancient family in Staffordshire, was born in 1659. He was in 1674 admitted a pensioner in Sidney college, Cambridge, where, notwithstanding several disadvantages, he acquired a great degree of reputation. In 1682, seeing no prospect of preferment, he became assistant to the head-master of Birmingham school. Some time after, he got a small lecture about two miles distant, but did the duty the whole Sunday; which, together with the business of a great free-school for about four years, began to break his constitution. During this space he likewise underwent a great deal of trouble and uneasiness, in order to extricate two of his brothers from some inconveniences, to which their own imprudence had subjected them. In 1689 affairs took a new turn. He found himself by a cousin's will entitled to a very ample estate; and came to London that same year, where he settled; choosing a private, retired, and studious life. Not long before his death, he published his treatise, entitled, *The Religion of Nature Delineated*; a work for which so great a demand was made, that more than 10,000 were sold in a very few years. He had scarcely completed the publication of it, when he unfortunately broke an arm; and this adding strength to distempers that had been growing upon him for some time, accelerated his death; which happened upon the 29th of October, 1724. He was a tender, humane, and in all respects worthy man; but is represented to have had something of the irascible in his constitution and temperament. His *Religion of Nature Delineated* exposed him to some censure, as if he had put a slight upon Christianity by laying so much stress, as he does in this work, upon the obligations of truth, reason, and virtue; and by making no mention of revealed religion. But this censure must have been the offspring of ignorance or envy, since it appears from the introduction to his work, that he intended to treat of revealed religion in a second part, which he lived not to finish.

WOLSEY (Thomas), a famous cardinal and archbishop of York, is said to have been the son of a butcher at Ipswich. He studied at Magdalen College, Oxford, where he became acquainted with the learned Erasmus; and in the year 1500 became rector of Lymington in Somersetshire: he was afterwards made chaplain to King Henry VIII. and obtained several preferments. Having gradually acquired an entire ascendancy over the mind of Henry VIII. he successively obtained several bishoprics, and at length was made archbishop of York, lord high-chancellor of England, and prime minister; and was for several years the arbiter of Europe. Pope Leo X. created him cardinal in 1515, and made him *legate à latere*; and the emperor Charles V. and the French king Francis I. loaded him with favours, in order to gain him over to their interest: but after having first sided with the emperor, he deserted him to espouse the interest of France. As his revenues were immense, his pride and ostentation were carried to the greatest height. He had 500 servants; among whom were nine or ten lords, fifteen knights, and forty esquires. His ambition to be pope, his pride, his exactions, and his political delay of Henry's divorce, occasioned his disgrace. In the earlier part of his life he seems to have been licentious in his manners; for there goes a story, that soon after his preferment to the living of Lymington in Somersetshire, he was put into the stocks by Sir Amias Paulet, a neighbouring justice of the peace, for getting drunk and making a riot at a fair. This treatment Wolsey did not forget when he arrived at the high station of lord-chancellor of England; but summoned his corrector up to London, and, after a severe reprimand, enjoined him six years' close confinement in the Tem-

ple. Whatever may have been his faults, there can be no doubt of their having been aggravated both by the zealous reformers and by the creatures of Henry VIII. who was himself neither Papist nor Protestant; for there is every reason to believe that the cardinal was sincere in his religion; and sincerity, or at least consistency, was then a crime. Wolfey was the patron of learned men; a judge and munificent encourager of the polite arts; and ought to be considered as the founder of Christ-church College, Oxford: where, as well as in other places, many remains of his magnificent ideas in architecture still exist. He died in 1530.

WOMB, or UTERUS. See ANATOMY.

WOOD (Anthony), an eminent biographer and antiquarian, was the son of Thomas Wood, bachelor of arts and of the civil law, and was born at Oxford in 1632. He studied at Merton College, and in 1655 took the degree of master of arts. He wrote, 1. The History and Antiquities of the University of Oxford; which was afterwards translated into Latin by Mr. Wale and Mr. Peers, under the title of *Historia & Antiquitates Universitatis Oxoniensis*, 2 vols. folio. 2. *Athene Oxonienses*; or an exact Account of all the Writers and Bishops who have had their Education in the University of Oxford, from the Year 1500 to 1603, 2 vols. folio; which was greatly enlarged in a second edition published in 1721 by Bishop Tanner. Upon the first publication of this work the author was attacked by the university, in defence of Edward earl of Clarendon, lord high-chancellor of England, and chancellor of the university, and was likewise animadverted upon by Bishop Burnet; upon which he published a Vindication of the Historiographer of the University of Oxford. He died at Oxford of a retention of urine in 1695.

WOOD, a substance whereof the trunks and branches of trees consist. It is composed of a number of concentric circles or zones, one of which is formed every year; consequently their number corresponds to the age of the tree. These zones vary in thickness according to the degree of vegetation that took place the year of their formation. They are also of different degrees of thickness in different parts, that part of the tree which is most exposed to the sun and best sheltered growing fastest; hence in this country that part of the zone which looked towards the south while the tree was growing is generally thickest. The innermost circle or zone is the one which was first formed, the outermost was formed the year before the tree was cut down. These zones are at first very soft and tender, and harden by degrees as the tree becomes older: this is the reason that the middle of a tree is so often much better wood than the outside of it. The proper ligneous part of the wood consists of longitudinal fibres, disposed in fasciculi, and possessed of considerable hardness. It is this longitudinal direction of the fibres that renders it so much easier to cleave wood lengthwise than across the tree, or in any other direction. See PLANT.

Chemists have attempted to ascertain the ingredients which enter into the composition of wood. The task, however, is so difficult, that they have by no means made the same progress that they have done in analysing the various mineral productions of nature. When wood is distilled, water comes over first; soon after it begins to be impregnated with oil, then an empyreumatic oil comes over, then carbonic acid gas, then hydrogen gas, and lastly carbonated hydrogen gas; a coal remains behind, which is composed of charcoal, fixed alkali, various earths, and sometimes also of several neutral salts and metallic substances. This was once looked upon by chemists as a perfect analysis, and it was supposed that all the various

substances above mentioned existed in plants in their proper form. But this is now known to be a mistake: the action of the fire produces new combinations in the ultimate ingredients of the plant, and thus produces new substances; and it is only these that are obtained by the above process. It is sufficient however to show, that wood is composed in a great measure of carbon, oxygen, and hydrogen, combined variously and in unknown proportions with one another; as most of the products of the distillation can be resolved into these substances.

There are many varieties of wood possessed of distinguishing properties, as cedar, box, ebony, &c. See those articles.

For more complete information concerning wood, see the articles PLANT and TREE.

Fossil WOOD. Fossil wood, or whole trees, or parts of them, are very frequently found buried in the earth, and that in different strata; sometimes in stone, but more usually in earth; and sometimes in small pieces loose among gravel. These, according to the time they have lain in the earth, or the matter they have lain among, are found differently altered from their original state; some of them having suffered very little change; and others being so highly impregnated with crystalline, sparry, pyritical, or other extraneous matter, as to appear mere masses of stone, or lumps of the common matter of the pyrites, &c. of the dimensions, and, more or less, of the internal figure of the vegetable bodies into the pores of which they have made their way.

The fossil woods which we find at this day are, according to these differences, arranged by Dr. Hill into three kinds; 1. The less altered: 2. The pyritical: and, 3. The petrified.

Of the trees, or parts of them, less altered from their original state, the greatest store is found in digging to small depths in bogs, and among what is called *peat* or *turf earth*, a substance used in many parts of the kingdom for fuel. In digging among this, usually very near the surface, immense quantities of vegetable matter of various kinds are found buried; in some places there are whole trees scarce altered, except in colour; the oaks in particular being usually turned to a jetty black; the pines and firs, which are also very frequent, are less altered, and are as inflammable as ever, and often contain between the bark and wood a black resin. Large parts of trees have also been not unfrequently met with unaltered in beds of another kind, and at much greater depths, as in the strata of clay and loam, among gravel, and sometimes even in solid stone.

Beside these harder parts of trees, there are frequently found also in the peat earth vast quantities of the leaves and fruit and catkins of the hazel and similar trees: these are usually mixed with sedge and roots of grass, and are scarce at all altered from their usual texture. The most common of these are hazel nuts; but there are frequently found also the twigs and leaves of the white poplar; and a little deeper usually there lies a cracked and shattered wood, the crevices of which are full of a bituminous black matter: and among this the stones of plums and other stone-fruits are sometimes found, but more rarely.

In this state the fruits and larger parts of trees are usually found: what we find of them more altered, are sometimes large and long, sometimes smaller and shorter branches of trees, sometimes small fragments of branches, and more frequently small shapeless pieces of wood. The larger and longer branches are usually found bedded in the strata of stone, and are more or less altered into the nature of the stratum they lie in. The shorter and smaller branches are found in vast variety in the strata of blue clay used for making tiles in the neighbourhood of London. These are prodigiously plentiful in all the clay pits of this kind, and usually carry the

whole external resemblance of what they once were, but nothing of the inner structure; their pores being wholly filled, and undistinguishably closed, by the matter of the common pyrites, so as to appear mere simple masses of that matter. These fall to pieces on being long exposed to moisture; and are so impregnated with vitriol, that they are what is principally used for making the green vitriol or copperas at Deptford and other places.

The irregular masses or fragments of petrified wood are principally of oak, and are most usually found among gravel; though sometimes in other strata. These are variously altered by the insinuation of crystalline and stony particles; and make a very beautiful figure when cut and polished, as they usually keep the regular grain of the wood, and show exactly the several circles which mark the different years' growth. These, according to the different matter which has filled their pores, assume various colours, and the appearance of the various fossils that have impregnated them; some are perfectly white, and but moderately hard; others of a brownish black, or perfectly black, and much harder; others of a reddish black, others yellowish, and others greyish, and some of a ferruginous colour. They are of different weights also and hardinesses, according to the nature and quantity of the stony particles they contain: of these, some pieces have been found with every pore filled with pure pellucid crystal: and others in large masses, part of which is wholly petrified and seems mere stone, while the rest is crumbly and is unaltered wood. That this alteration is made in wood, even at this time, is also abundantly proved by the instances of wood being put into the hollows of mines, as props and supports to the roofs, which is found after a number of years as truly petrified as that which is dug up from the natural strata of the earth. In the pieces of petrified wood found in Germany, there are frequently veins of spar or of pure crystal, sometimes of earthy substances, and often of the matter of the common pebbles: these fragments of wood sometimes have the appearance of parts of the branches of trees in their natural state, but more frequently they resemble pieces of broken boards; these are usually capable of a high and elegant polish.

Many substances, it is certain, have been preserved in the cabinets of collectors, under the title of *petrified wood*, which have very little right to that name. But where the whole outer figure of the wood, the exact lineaments of the bark, or the fibrous and filular texture of the fibres, and the vestiges of the utriculi and tracheæ or air vessels, are yet remaining, and the several circles yet visible which denoted the several years' growth of the tree, none can deny these substances to be real fossil wood. See PETRIFICATION.

WOOD (*ſylva*), in geography, a multitude of trees extended over a large continued track of land, and propagated without culture. The generality of woods only consist of trees of one kind. The ancient Saxons had such a veneration for woods, that they made them sanctuaries. It is ordained, that none shall destroy any wood, by turning it into tillage or pasture, &c. where there are two acres or more in quantity, on pain of forfeiting 40s. an acre, by 35 Henry VIII. c. 17. All woods that are felled at 14 years' growth, are to be preserved from destruction for eight years; and no cattle put into the ground till five years after the felling thereof, &c. 23 Eliz. c. 25. The burning of woods or underwood is declared to be felony; also those persons that maliciously cut or spoil timber-trees, or any fruit-trees, &c. shall be sent to the house of correction, there to be kept three months, and whipt once a month.

WOODSTOCK, a town of Oxfordshire, in England, pleasantly seated on a rising ground, and on a rivulet; a well-compacted borough town, and sends two members to parliament; but is chiefly noted for Blenheim-house, a fine palace, built in memory of the victory obtained by the Duke of Marlborough over the French and Bavarians in August 1704. It was erected at the public expence, and is one of the noblest seats in Europe. One of the passages to it is over a bridge with one arch, 190 feet in diameter, resembling the Rialto at Venice. The gardens take up 100 acres of ground; and the offices, which are very grand, have room enough to accommodate 300 people. The apartments of the palace are magnificently furnished; and the staircases, statues, paintings, and tapestry, surpassingly fine. The town is about half a mile from the palace, having several good inns; and a manufacture of steel chains for watches, and excellent gloves. It is 8 miles north of Oxford, and 60 west-north-west of London. W. Long. 1. 15. N. Lat. 51. 52.

WOODWARD (Dr. John), was born in 1665, and educated at a country school, where he learned the Latin and Greek languages, and was afterwards sent to London, where he is said to have been put apprentice to a linen-draper. He was not long in that station, till he became acquainted with Dr. Peter Barwick, an eminent physician, who took him under his tuition and into his family. Here he prosecuted with great vigour and success the study of philosophy, anatomy, and physic. In 1692, Dr. Stillingfleet quitting the place of professor of physic in Gresham college, our author was chosen to succeed him, and the year following was elected F. R. S. In 1695 he obtained the degree of M. D. by patent from Archbishop Tennison; and the same year he published his Essay toward a Natural History of the Earth. He afterward wrote many other pieces, which have been well received by the learned world. He founded a lecture in the university of Cambridge, to be read there upon his Essay, &c. and handsomely endowed it. He died in 1728.

WOOF, among manufacturers, the threads which the weavers shoot acrofs with an instrument called the *shuttle*. See CLOTH.

WOOLKEY or OREY Hole, a remarkable cavern two miles from the city of Wells in Somersetshire; for an account of which, see the article GROTTO.

WOOL, the covering of sheep. See OVIS, and SHEEP. Wool resembles hair in a great many particulars; but besides its fineness, which constitutes an obvious difference, there are other particulars which may serve also to distinguish them from one another. Wool, like the hair of horses, cattle, and most other animals, completes its growth in a year, and then falls off as hair does, and is succeeded by a fresh crop. It differs from hair, however, in the uniformity of its growth, and the regularity of its shedding. Every filament of wool seems to keep exact pace with another in the same part of the body of the animal; the whole crop springs up at once; the whole advances uniformly together; the whole loosens from the skin nearly at the same period, and thus falls off in not previously shorn, leaving the animal covered with a short coat of young wool, which in its turn undergoes the same regular mutations.

Hairs are commonly of the same thickness in every part; but wool constantly varies in thickness in different parts, being generally thicker at the points than at the roots. That part of the fleece of sheep which grows during the winter is finer than that which grows in summer. This was first observed by Dr. Anderson, the editor of the Bee, and published in his *Observations on the Means of exciting a Spirit of National Industry*.

While the wool remains in the state it was first shorn off the sheep's back, and not sorted into its different kinds, it is called *fleece*. Each fleece consists of wool of divers qualities and degrees of fineness, which the dealers therein take care to separate. The French and English usually separate each fleece into three sorts, viz. 1. Mother-wool, which is that of the back and neck. 2. The wool of the tails and legs. 3. That of the breast and under the belly. The Spaniards make the like division into three sorts, which they call *prime*, *second*, and *third*; and for the greater ease denote each bale or pack with a capital letter, denoting the sort. If the triage or separation be well made, in 15 bales there will be 12 marked R, that is, refine, or prime; two marked F, for fine, or second; and one S, for thirds. The wools most esteemed are the English, chiefly those about Leominster, Cotswold, and the Isle of Wight; the Spanish, principally those about Segovia; and the French, about Berry; which last are said to have this peculiar property, that they will knot or bind with any other sort; whereas the rest will only knot with their own kind.

Among the ancients, the wools of Attica, Megara, Laodicea, Apulia, and especially those of Tarentum, Parma, and Altino, were the most valued. Varro assures us, that the people there used to clothe their sheep with skins to secure the wool from being damaged.

Of late a great deal of attention has been paid to wool in this country, as well as several others. Several very spirited attempts have been made to improve it by introducing superior breeds of sheep, and better methods of managing them. For this purpose has been formed the *British Wool Society*.

British Wool Society, an association formed for the purpose of obtaining the best breeds of fine-woolled sheep, with a view of ascertaining, by actual experiments, how far each species or variety is calculated for the climate of Great Britain; the qualities of their wool respectively; the uses to which each kind of wool could be most profitably employed in different manufactures; and the comparative value of each species of sheep, so far as the same can be determined.

Attention had for some time been paid by the Highland Society to a famous breed of fine-woolled sheep in Shetland; but it occurred to Sir John Sinclair, and Dr. Anderson, well known as the author of many useful publications, that the improvement of British wool was a matter of too much importance to be intrusted to a society which is obliged to devote its attention to such a variety of objects as the general improvement of the Highlands of Scotland. The latter of these gentlemen, therefore, in an Appendix to the Report of the Committee of the Highland Society of Scotland, for the year 1799, proposed the plan of a patriotic association for the improvement of British wool; and the former, who was convener of the committee, to whom the subject of Shetland wool had been referred, wrote circular letters recommending the plan. The consequence of which was, that, on the 31st of January 1791, several noblemen and gentlemen constituted themselves a *Society for the Improvement of British Wool*. Of this society Sir John Sinclair was elected president.

The particular breeds of sheep to which the society proposed to direct its attention, were sheep for the hilly parts of Scotland; sheep for the plains, or the Lowland breed; and sheep for the islands. They were to try experiments also with sheep from foreign countries distinguished by any particular property.

The principal objects which the members had in view, during the first year of their association, were, 1. To collect specimens of the best breeds which Great Britain at that period afforded, in order to ascertain the degree of perfection to which sheep had already been brought in this kingdom.

VOL. X.

2. To procure from every country distinguished for the quality of its sheep and wool, specimens of the different breeds it possessed, in order to ascertain how far the original breed, or a mixed breed from it and the native sheep of the country, could thrive in Scotland. 3. To disperse as much as possible all these breeds, both foreign and domestic, over the whole kingdom, wherever proper persons could be found to take charge of them, in order to try experiments on a more extensive scale than the society itself could do; to spread information, and to excite a spirit for the improvement of sheep and wool in every part of the country.

In the course of one year the society acquired by donation or purchase about 800 sheep of different sorts and ages, and many of them from foreign countries; about 500 of these were distributed over different parts of Scotland, the greater number of which were sold to gentlemen anxious to promote the views of the society, and well qualified to make experiments on the different breeds which they had obtained. The greatest part of the remainder were taken by different gentlemen who kept them for the society, and according to their directions, without any expense.

It is impossible to produce an instance of so much having been accomplished by a society of private individuals in so short a time. Nor was this all; the same year Mr. Andrew Kerr, a very intelligent sheep farmer on the borders of England, was sent, at the expense of the society, to examine the state of sheep-farming along the east coast of Scotland and the interior part of the Highlands. His tour was printed by order of the society, and contains the first intimation of the possibility of the Cheviot breed thriving in the north of Scotland.

In the year 1792, Messrs. Redhead, Laing, and Marshall, were sent by the society to make a survey of the state of sheep-farming through some of the principal counties of England; the result of which was also published by the society, and contains more information on the subject of the different breeds of England than any work hitherto published; and in 1794, Mr. John Naismith was sent on a tour through the southern districts of Scotland, which completed the circuit of almost the whole kingdom.

Thus a few private individuals, unaided by the public purse, had boldness enough to undertake ascertaining the comparative value of the different kinds of sheep in their own country, and to introduce some of the most celebrated breeds of other countries, and succeeded in the spirited attempt.

WOOLSTONE (Thomas), an English divine, was born at Northampton in 1669, and educated at Cambridge. His first appearance in the learned world was in 1705, in a work entitled, *The old Apology for the Truth of the Christian Religion, against the Jews and Gentiles*, revived. He afterward wrote many pieces; but what made the most noise, were his Six Discourses on the Miracles of Christ; which occasioned a great number of books and pamphlets upon the subject, and raised a prosecution against him. At his trial in Guildhall, before the lord chief-justice Raymond, he spoke several times himself; and urged, that "he thought it very hard that he should be tried by a set of men who, though otherwise very learned and worthy persons, were no more judges of the subjects on which he wrote, than himself was a judge of the most crabbed points of the law." He was sentenced to a year's imprisonment, and to pay a fine of 100*l*. He purchased the liberty of the rules of the King's Bench, where he continued after the expiration of the year, being unable to pay the fine. The greatest obstriction to his deliverance from confinement was, the obligation of giving security not to offend by any future writings, he being resolved to write again as freely as before. Whilst some supposed that

R r

this author wrote with the settled intention of subverting Christianity under the pretence of defending it, others believed him disordered in his mind; and many circumstances concurred which gave countenance to this opinion. He died, January 27, 1732-3, after an illness of four days; and, a few minutes before his death, uttered these words: "This is a struggle which all men must go through, and which I bear not only patiently, but with willingness." His body was interred in St. George's church-yard, Southwark.

WOOLWICH, a town in Kent, with a market on Fridays, but no fair. It is seated on the river Thames, and of great note for its fine docks and yards, where men-of-war are built; as also for its vast magazines of great guns, mortars, bombs, cannon-balls, powder, and other warlike stores. It has likewise an academy, where the mathematics are taught, and young officers instructed in the military art. It is nine miles east of London. E. Long. o. 10. N. Lat. 51. 30.

WORCESTER, a city of England, capital of a county to which it gives name, and see of a bishop, situated on the river Severn, over which a new bridge has been built within about thirty years. The judicious continuator of Camden thinks Worcester had no share in Roman transactions, but that it was called *Caer Guadronon* by the Britons. It was erected into a bishopric, in the year 680. In the year 1041 it was sacked and burned by Hardicanute the Dane, who put all the inhabitants to the sword, except those who saved themselves in an island in the Severn, because the citizens had killed the officer appointed to collect the tax called Danegelt; it however soon after recovered, and in Edward the Confessor's reign, had many burgesses, and a mint. In the year 1113, an accidental fire consumed the castle, and much damaged the cathedral. In the wars which happened in the reign of Stephen, it was more than once set on fire, but chiefly suffered when taken by Stephen from the Earl of Mellent. In the cathedral is the tomb of King John, supposed to be the oldest royal monument remaining in England; he was buried in the choir between two bishops. Near this city, in the year 1651, a battle was fought between Charles II. and Cromwell, which proved a decisive blow to royalty. Charles, after beholding the ruin of his cause, and giving many proofs of personal valour, was obliged to have recourse to flight. The Duke of Hamilton, who made a desperate resistance, was mortally wounded, and the Scots were almost all either killed or taken. The prisoners, to the number of 8000, were sold as slaves to the American planters. The principal manufacture of Worcester is that of gloves, with one of elegant China-ware. Worcester is large, populous, and well built. Besides the cathedral, it contains nine parish churches, about 2000 houses, and a public infirmary. It is a county of itself, and by a charter of James I. is governed by a mayor, six aldermen, sheriff, recorder, &c. Here are three markets weekly, on Monday, Wednesday, and Friday, and two members are returned to the British parliament: 59 miles N. Bristol, and 120 W. N. W. London.

WORCESTER (Earl of). See **TIPSTOFT**.

WORCESTERSHIRE, a county of England, bounded on the north by Staffordshire and Shropshire, on the east by Warwickshire, on the south by Gloucestershire, and on the west by Herefordshire and Shropshire. Its figure is very irregular; and it is remarkable for having several detached portions sprinkled about the neighbouring counties; a consequence, probably, of its having no natural boundaries. Its measurements, on this account, can scarcely be stated, but the greatest length may be about thirty miles, and breadth about twenty. It is divided into six hundreds, which contain one city (Worcester), ten towns, and 152 parishes: the number of inhabitants is estimated at 70,000. The principal rivers are the Severn, which passes through a rich vale in its whole length, the

Teme, the Avon, the Stour, and the Arrow. Besides the vale in which the Severn flows, is another, called *The Vale of Evesham*, on the banks of the Avon, which flows along the south-eastern parts of the county in its course to meet the Severn. Besides the usual objects of agriculture, great quantities of garden-stuff are here grown, and sent to the towns around, to a considerable distance. In this vale, fell Simon de Montfort, with many of his party, under the arms of Prince Edward, son of Henry III. in the barons' war against that king. The products of Worcestershire; besides the common ones of corn and cattle, are fine wool, hops, cyder, and perry; the latter, especially, is in great reputation. A large quantity of the whitest felt is made from the brine-springs at Droitwich, and sent to Bristol and other places. The Severn in this county and Gloucestershire abounds with lampreys, which by some are much valued as a delicacy. In the Malvern Hills, a spring rises of uncommon purity, which is much resorted to in scrophulous and scorbutic cases. After the Britons were driven out by the Saxons, they retired beyond the Severn, and defended their new territories against the encroaching conquerors; so that this county, with the others through which that large river runs, were for a long time the frontiers between the two people, and, indeed, it has been supposed, that most of the great cities on the east side of the Severn and Dee were built by the Romans or Saxons, or both, against the Britons. The towns are Bewdley, Droitwich, Dudley, Evesham, Kidderminster, Perdhore, Shipston, Stourbridge, Tenbury, and Upton: the city of Worcester, and the county, with the towns of Droitwich and Evesham, each send two members to the British parliament; Bewdley returns one.

WORD, in language, an articulate sound designed to represent fœmidea or notion. See **GRAMMAR** and **LANGUAGE**. See also **LOGIC**, Part I. chap. 1.

WORD, or *Watch-word*, in military affairs, is some peculiar word or sentence, by which the soldiers know and distinguish one another in the night, &c. and by which spies and designing persons are discovered. It is used also to prevent surprisals. The word is given out in an army every night to the lieutenant, or major-general of the day, who gives it to the majors of the brigades, and they to the adjutants; who give it first to the field-officers, and afterwards to a serjeant of each company, who carry it to the subalterns. In garrisons it is given after the gate is shut to the town-major, who gives it to the adjutants, and they to the serjeants.

WORDS of Command. See **EXERCISE** and **MANUAL**.

WORK, in the manege. To work a horse, is to exercise him at pace, trot, or gallop, and ride him at the manege. To work a horse upon voltes, or head and haunches in or between two heels, is to passage him, or make him go sidewise upon parallel lines.

To WORK, in sea language, is to direct the movements of a ship, by adapting the sails to the force and direction of the wind. See **SEAMANSHIP**.

WORK, *Carpenters, Clock, Crown, Field, Fire, Fret, Grotesque, Horn, Mosaic*. See the several articles, together with **FORTIFICATION** and **PYROTECHNY**.

WORK-HOUSE, a place where indigent, vagrant, and idle people, are set to work, and supplied with food and clothing.

Work-houses are of two kinds, or at least are employed for two different purposes. Some are used as prisons for vagrants or sturdy beggars, who are there confined and compelled to labour for the benefit of the society which maintains them; whilst others, sometimes called *poor-houses*, are charitable asylums for such indigent persons as through age or infirmity are unable to support themselves by their own labour. The former kind of work-house, when under proper management, may be made to serve the best of purposes; of the latter we

are acquainted with none which entirely commands our approbation.

To make confinement in a work-house operate to the correction of vagrants and disorderly persons (and if it produce not this effect, it can hardly be considered as a beneficial institution), the prisoners should be shut up in separate cells, and compelled to labour for their own subsistence. A crew of thieves and vagabonds associating with each other is a hell upon earth, in which every individual is hardened in his crimes by the countenance and conversation of his companions; and wretches who, when at liberty, choose to beg or steal rather than to earn a comfortable livelihood by honest industry, will submit to any punishment which a humane overseer can inflict rather than work for the benefit of others. No punishment indeed will compel a vagrant to labour. He may affirm the appearance of it, but he will make no progress; and the pretext of sickness or weakness is ever at hand for an excuse. Hence it is that thieves and strumpets are too often dismissed from work-houses and bridewells ten times more the children of the devil than when they entered them.

To remedy these evils, we can think of no better method than to confine each prisoner in a cell by himself, and to furnish him daily with such an allowance of bread and water as may preserve him from immediate death; for the only compulsion to make such men work seriously is the fear of want, and the only way to reform them is to leave them to their own meditations on the consequences of their past conduct. There are surely very few persons, if any, whose aversion from labour would not be conquered by the pinchings of hunger and the certain prospect of perishing by famine; and it is to be hoped that there are not many so totally divested of every latent principle of virtue, as not to be brought by such solitude to a due sense of their former wickedness. Should one or two, however, be occasionally found so very obdurate as to suffer themselves to perish rather than work, their deaths would prove a salutary beacon to others, and their blood would be on their own heads; for we have the express command of St Paul himself, that "if any will not work, neither should he eat."

No doubt it would be proper that the meditations of vagabonds confined in a work-house should be directed by the private admonitions of a pious and intelligent clergyman; but it is not every clergyman who is qualified to discharge such a duty. If he be actuated by a zeal not according to knowledge, or if he have not with equal care studied human nature and the word of God, his admonitions will be more likely to provoke the profane ridicule of his auditor, and harden him in his wickedness, than to excite in his breast such sorrow for his sins as shall "bring forth fruits meet for repentance." To render the instruction of thieves and vagrants of any use, it must be accurately adapted to the case of each individual; and however excellent it may be in itself, it will not be listened to unless offered at seasons of uncommon seriousness, which the instructor should therefore carefully observe.

That such wholesome severity as this would often reform the inhabitants of work-houses, appears extremely probable from the effects of a similar treatment of common prostitutes mentioned by Lord Kames in his Sketches of the History of Man: "A number of those wretches were in Edinburgh confined in a house of correction, on a daily allowance of three pence, of which part was embezzled by the servants of the house. Pinching hunger did not reform their manners; for being absolutely idle, they encouraged each other in vice, waiting impatiently for the hour of deliverance. Mr. Stirling, the superintendent, with the consent of the magistrates, removed them to a clean house; and instead of money, appointed for each a pound of oat-meal daily, with salt, water, and fire for cooking. Relieved now from distress, they longed

for comfort. What would they not give for milk or ale? Work (says he) will procure you plenty. To some who offered to spin, he gave flax and wheels, engaging to pay them half the price of their yarn, retaining the other half for the materials furnished. The spinners earned about nine pence weekly; a comfortable addition to what they had before. The rest undertook to spin, one after another; and before the end of the first quarter they were all of them intent upon work. It was a branch of his plan to set free such as merited that favour; and some of them appeared to be so thoroughly reformed as to be in no danger of a relapse."

Work-houses erected as charitable asylums appear to us, in every view that we can take of them, as institutions which can serve no good purpose. Economy is the great motive which inclines people to this mode of providing for the poor. There is comparatively but a very small number of mankind in any country so aged and infirm as not to be able to contribute, in some degree, to their subsistence by their own labour; and in such houses it is thought that proper work may be provided for them, so that the public shall have nothing to give in charity but what the poor are absolutely unable to procure for themselves. It is imagined likewise, that numbers collected at a common table, can be maintained at less expence than in separate houses; and foot soldiers are given for an example, who could not live on their pay if they did not melt together. But the cases are not parallel. "Soldiers having the management of their pay, can club for a bit of meat; but as the inhabitants of a poor-house are maintained by the public, the same quantity of provisions must be allotted to each. The consequence is what might be expected: the bulk of them reserve part of their victuals for purchasing ale or spirits. It is vain to expect work from them: poor wretches void of shame will never work seriously, where the profit accrues to the public, not to themselves. Hunger is the only effectual means for compelling such persons to work."

The poor, therefore, should be supported in their own houses; and to support them properly, the first thing to be done is, to estimate what each can earn by his own labour; for as far only as that falls short of maintenance is there room for charity. In repairing those evils which society did not or could not prevent, it ought to be careful not to counteract the wise purposes of nature, nor to do more than to give the poor a fair chance to work for themselves. The present distress must be relieved, the sick and the aged provided for; but the children must be instructed; and labour, not alms, offered to those who have some ability to work, however small that ability may be. They will be as industrious as possible, because they work for themselves; and a weekly sum of charity under their own management will turn to better account than in a poor-house under the direction of mercenaries. Not a penny of it will be laid out on fermented liquors, unless perhaps as a medicine in sickness. Nor does such low fare call for pity to those who can afford no better. Alms makes no part of the maintenance of those who, in many parts of Scotland, live by the sweat of their brows; and yet the person who should banish all from a charity work-house, would be exclaimed against as hard-hearted, and even void of humanity.

That such a mode of supporting the poor in their own houses is practicable, will hardly admit of a dispute; for it has been actually put in practice in the city of Hamburg ever since the year 1788. At that period such revenues as had till then been expended in alms by the several churchwardens, and those of which the administration had been connected with the work-house, were united under one administration with such sums as were collected from private benevolence. The city was divided into sixty districts, containing each an equal number of poor; and over these, 180 overseers

were appointed. A final relief was the first object; but at the very moment that this provision was secured, measures were taken to prevent any man from receiving a dilling which he could have been able to earn for himself. By methods, which our limits will not permit us to state, the overseers were able to make a calculation tolerably exact of what each pauper wanted for bare subsistence, in addition to the fruits of his own labour. A flax-yarn-spinning manufacture was established, in which the yarn is paid for, not by its weight, but by its measure. The clean flax is sold to the poor at a low price, and a certain measure of yarn again bought from them at 30 per cent. above the usual price: so that the overseers are sure that all the yarn spun by the poor will be brought into their office. Every pauper brings with him a book in which the quantity delivered is carefully noted down, which furnishes the overseers with a continual average of the state of industry among their poor.

As soon as this institution was established, the overseers went through their districts, and asked, in all such mansions as could be supposed to harbour want, if the inhabitants stood in need of support? The question to all such poor as wished for relief, and were able to spin, was, Whether they did earn by their work 1s. 6d. a week? for experience had taught the inhabitants of Hamburg, that many poor live upon that sum; and they knew enough of their poor to suppose, that 1s. 6d. avowed earning was equal to something more. If the answer was affirmative, the pauper stood not in need of weekly assistance. If it was negative, work was given him, which, by being paid 30 per cent. above its value, afforded him 1s. 6d. a-week easily, if he was even an indifferent hand. The far more frequent cases were partial inability by age, or weakness, or want of skill. For poor of the latter description a school was opened, and in three months' time the business was easily learnt. During that time, the pauper got first 2s. a-week, and every week afterwards 2d. less, till in the twelfth week he got nothing at all but his earnings, and was dismissed, with a wheel and a pound of flax gratis.

The quantity of work which disabled poor were capable of doing in a week was easily and accurately ascertained by a week's trial in the spinning-school. The result was produced weekly before appointed members of the committee, and the sum which the poor could earn was noted down in their small books. The overseer was directed to pay them weekly what their earnings fell short of 1s. 6d. in every such week, when it appeared from their books that they had earned to the known extent of their abilities. From that moment applications became less frequent; and the committee had an infallible standard for distinguishing real want; for whenever the pauper, if in health (if not, he was peculiarly provided for), had not earned what he could, then he had either been lazy, or had found more lucrative work; in either case, he was not entitled to a relief for that week, whatever he might be for the following.

This mode of providing for the poor, which attracted the notice and obtained the eulogium of the minister in the British house of commons, has for six years been in Hamburg attended with the happiest consequences. In the streets of that city a beggar is rarely to be seen, whilst those, who stand in need of the charitable contributions of the rich, are much more comfortably, as well as at much less expence, maintained at home, with their children about them, than they could be in work-houses, under the management of mercenary overseers. For a fuller account of this judicious institution, we must refer the reader to Vought's *Account of the Management of the Poor in Hamburg, since the year 1788, in a Letter to some Friends of the Poor in Great Britain.*

WORLD, the assemblage of parts which compose the globe of the earth. See GEOGRAPHY and ASTRONOMY.

WORM, in gunnery, a screw of iron, to be fixed on the end of a rammer, to pull out the wad of a firelock, carbine, or pistol, being the same with the wad-hook, only the one is more proper for small arms, and the other for cannon.

WORM, in chemistry, is a long winding pipe, placed in a tub of water, to cool and condense the vapours in the distillation of spirits.

Blind-WORM, or Slow-WORM. See ANGIUS.

Earth-WORM. See LUMBRICUS.

Glow-WORM. See LAMPYRIS.

Silk-WORM. See SILK.

WORMS, VERMES, in natural history. See ZOOLOGY.

WORMS, in the human body. See MEDICINE.

WORMS, in horses. See FARRIERY.

WORMS, in dogs. See DOG.

WORMS, for bait. See FISHING.

WORMS, an ancient, large, and famous city of Germany, in the palatinate of the Rhine, with a bishop's see, whose bishop is a sovereign and prince of the empire. It is a free and imperial city, and the inhabitants are Protestants. In the war of 1689 it was taken by the French, who almost reduced it to ashes.—The bishop afterwards built a new palace in it; and it is famous for a diet held here in 1521, at which Luther assisted in person. The Protestants have lately built a handsome church, where Luther is represented as appearing at the diet. It is noted for the excellent wine that grows in the neighbourhood, which they call *our Lady's milk*. In the campaign of 1743, King George II. took up his quarters in this city, and lodged at the bishop's palace after the battle of Dettingen. It is seated on the western bank of the Rhine, 14 miles north-west of Heidelberg, 20 south-east of Mentz, and 32 south-west of Francfort. E. Long. 8. 29. N. Lat. 49. 32.

WORMING or DOGS. All spaniels have certain strings under their tongues, by most called a *worm*; this must be taken out when they are about two months old, with the help of a sharp knife to slit it, and a shoemaker's awl to raise it up; you must be careful to take all out, or else your pains is to little purpose; for till then he will be hardly ever fat and right, in regard the worm or string will grow foul and troublesome, and hinder his rest and eating. This operation is generally recommended as a preventive of madness in dogs, or at least as disabling them, if mad, from biting in that condition.

WORMIUS (Olaus), a learned Danish physician, born in 1588 at Arhulen in Jutland. After beginning his studies at home, he studied at several foreign universities, and travelled to various parts of Europe for improvement. He returned to his native country in 1613, and was made professor of the belles-lettres in the university of Copenhagen. In 1615 he was translated to the chair of the Greek professor; and in 1624 to the professorship of physic, which he held to his death. These occupations did not hinder him from practising in his profession, and from being the fashionable physician: the king and court of Denmark always employed him; and Christian IV. as a recompense for his services, conferred on him a canonry of Lunden. He published some pieces on subjects relating to his profession, several works in defence of Aristotle's philosophy, and several concerning the antiquities of Denmark and Norway; for which latter he is principally regarded, as they are very learned, and contain many curious particulars. He died in 1654.

WORMWOOD, in botany. See ARTEMISIA.

WORSHIP OF GOD (*cultus Dei*), amounts to the same with what we otherwise call religion. This worship consists in paying a due respect, veneration, and homage to the Deity,

under a certain expectation of reward. And this internal respect, &c. is to be shown and testified by external acts; as prayers, sacrifices, thanksgivings, &c.

As Christian worship consists of prayers and praises, it has been a matter of some debate whether it is most properly performed by preconcerted forms or liturgies, or by extemporaneous addresses to the Almighty. Both these modes have their advantages and disadvantages; and by the sacred writers neither of them is prescribed in opposition to the other.

The advantages of a liturgy are, that it prevents absurd, extravagant, or impious addresses to God, which the folly or enthusiasm of individuals must always be in danger of producing; it gives the congregation an opportunity of joining in the prayers which are put up for them, which they cannot possibly do in a series of extemporaneous petitions, since before they can assent to any one of these and make it their own, their attention is necessarily called away to that which succeeds it; and it relieves the clergyman from the labour of composition, which seems incompatible with that fervour which constitutes the spirit of devotion.

The disadvantages of a fixed liturgy, which are the recommendations of extemporary prayer, are principally two. The forms composed in one age must, by the unavoidable change of language, circumstances, and opinions, become in some degree unfit for another; and the perpetual repetition of the same form of words is very apt to produce inattentive lassitude in the congregation. Would the clergy of the church of England take that liberty which is allowed them in the bidding prayer before sermon, perhaps the service of that church would unite in itself all the advantages both of liturgic and extemporary worship. We have only to add on this subject, that public prayers, whether precomposed or not, ought to be compendious; that they ought to express just conceptions of the Divine attributes; recite such wants as the congregation are likely to feel, and no other; that they ought to contain as few controverted propositions as possible; and that, if it can be done without offence, the pompous style of the *state* should be laid aside in our prayers for the king and all that are in authority; because in every act which carries the mind to God, human greatness must be annihilated.

WORT, the infusion of malt, of which beer is made. The uses of this infusion in common affairs are well known. By Dr. M'Bride it has lately been found to have a strong antiseptic virtue, and to be useful in preventing the scurvy and other diseases to which sailors are liable; and this was confirmed by Captain Cook in his late voyages. See M'BRIDE'S Essay on the Means of Preserving the Health of SEAMEN.

WOTTON (Sir Henry), an eminent writer, was the son of Thomas Wotton, esq. and was born in 1568. He studied for some time at New College, Oxford, whence he removed to Queen's College, where he made a great progress in logic and philosophy; wrote a tragedy for the use of that college, called *Tamredo*; and afterwards received the degree of master of arts. After this, leaving the university, he travelled into France, Germany, and Italy; and having spent about nine years abroad, he returned to England, and became secretary to Robert earl of Essex, with whom he continued till that earl was apprehended for high-treason. He then retired to Florence, where he became known to the Grand Duke of Tuscany, who sent him privately with letters to James VI. king of Scotland, under the name of *Orazio Baldi*, to inform that king of a design against his life. Some months after he went back to Florence; but King James coming to the possession of the crown of England, Mr. Wotton returned home, was knighted by his majesty, and sent ambassador to the republic of Venice; and afterwards was employed in many other embassies, to that and other courts; but the only reward he obtained for

these services was his having the provostship of Eton conferred upon him about the year 1623, which he kept till his death, which happened in 1639. After his decease some of his manuscripts and printed tracts were published together in a volume, entitled *Reliquie Wottonianae*.

WOTTON (William), an English divine, was the son of Mr. Henry Wotton, rector of Wrentham, in Suffolk, a man of considerable learning, and well skilled in the Oriental tongues. He was born at Wrentham the 13th of August, 1666; and was educated by his father. He was admitted of Catharine-hall, Cambridge, in April, 1676, some months before he was ten years old. His progress in learning was answerable to the expectations conceived of him. He not only understood the Greek and Latin tongues, but also the Hebrew, Arabic, Syriac, and Chaldean: his skill too in arts and sciences, in geography, logic, philosophy, mathematics, and chronology, was equally great. In 1679 he took the degree of B.A. when he was but twelve years and five months old. Dr. William Lloyd, bishop of St. Asaph, took him as assistant in making the catalogue of his library, and carried him to St. Asaph. Upon his return, Dr. Turner, afterwards bishop of Ely, procured him by his interest a fellowship in St. John's College; and, in 1691, he commenced bachelor of divinity. The same year, Bishop Lloyd gave him the sinecure of Llandrillo in Denbighshire. He was afterwards made chaplain to the Earl of Nottingham, then secretary of state, who, in 1693, presented him to the rectory of Middleton Keynes in Buckinghamshire. In 1694 he published Reflections upon Ancient and Modern Learning; and afterwards a Defence of the same, it being satirized by Swift. In 1718 he produced his Miscellaneous Discourses relating to the Traditions and Usages of the Scribes and Pharisees, &c. in 2 vols. 8vo. besides several other tracts, sermons, &c. After his death, which happened Feb. 13, 1726, his translation of the Welsh Laws came out; a very laborious work; also A Discourse concerning the Confusion of Languages at Babel; Advice to a Young Student, &c.

WOUNDS. See SURGERY.

WOUNDS, in farriery. See FARRIERY.

WRASSE, or old wife, in ichthyology. See LABRUS.

WREATH, in heraldry, a roll of fine linen or silk (like that of a Turkish turban), consisting of the colours borne in the escutcheon, placed in an achievement between the helmet and the crest, and immediately supporting the crest.

WRECK, or SHIPWRECK, the destruction of a ship by rocks or shallows at sea. By the ancient common law, where any ship was lost at sea, and the goods or cargo were thrown upon the land, these goods, so wrecked, were judged to belong to the king: for it was held, that, by the loss of the ship, all property was gone out of the original owner. But this was undoubtedly adding sorrow to sorrow, and was consonant neither to reason nor humanity. Wherefore it was first ordained by King Henry I. that if any person escaped alive out of the ship, it should be no wreck; and afterwards King Henry II. by his charter, declared, that if on the coasts of either England, Poitou, Oleron, or Gascony, any ship should be distressed, and either man or beast should escape, or be found therein alive, the goods should remain to the owners, if they claimed them within three months; but otherwise should be esteemed a wreck, and should belong to the king, or other lord of the franchise. This was again confirmed with improvements by King Richard I.; who, in the second year of his reign, not only established these concessions, by ordaining that the owner, if he was shipwrecked and escaped, *omnes res suas liberat, et quietas haberet*, but also, that if he perished, his children, or in default of them, his brethren and sisters, should retain the property; and in default of brother or sister, then the goods

should remain to the king *. And the law, as laid down by Bracton in the reign of Henry III. seems still to have improved in its equity. For then, if not only a dog (for instance) escaped, by which the owner might be discovered, but if any certain mark were set on the goods, by which they might be known again, it was held to be no wreck. And this is certainly most agreeable to reason; the rational claim of the king being only founded upon this, that the true owner cannot be ascertained. Afterwards, in the first statute of Westminster, the time of limitation of claims, given by the charter of Henry II., is extended to a year and a day, according to the usage of Normandy: and it enacts, that if any man, a dog, or a cat, escape alive, the vessel shall not be adjudged a wreck. These animals, as in Bracton, are only put for examples; for it is now held, that not only if any live thing escape, but if proof can be made of the property of any of the goods or lading which come to shore, they shall not be forfeited as wreck. The statute further ordains, that the sheriff of the county shall be bound to keep the goods a year and a day (as in France for one year, agreeable to the maritime laws of Oleron, and in Holland for a year and a half), that if any man can prove a property in them, either in his own right or by right of representation, they shall be restored to him without delay; but if no such property be proved within that time, they then shall be the king's. If the goods are of a perishable nature, the sheriff may sell them, and the money shall be liable in their stead. This revenue of wrecks is frequently granted out to lords of manors as a royal franchise; and if any one be thus entitled to wrecks in his own land, and the king's goods are wrecked thereon, the king may claim them at any time, even after the year and day.

It is to be observed, that, in order to constitute a legal wreck, the goods must come to land. If they continue at sea, the law distinguishes them by the barbarous and uncouth appellations of *jetſam*, *ſhoſam*, and *ligan*. *Jetſam* is where goods are cast into the sea, and there sink and remain under water: *ſhoſam* is where they continue swimming on the surface of the waves: *ligan* is where they are sunk in the sea, but tied to a cork or buoy, in order to be found again. These are also the king's, if no owner appears to claim them; but if any owner appears, he is entitled to recover the possession. For even if they be cast overboard, without any mark or buoy, in order to lighten the ship, the owner is not, by this act of necessity, construed to have renounced his property: much less can things *ligan* be supposed to be abandoned, since the owner has done all in his power to assert and retain his property. These three are therefore accounted so far a distinct thing from the former, that by the king's grant to a man of wrecks, things *jetſam*, *ſhoſam*, and *ligan*, will not pass.

Wrecks, in their legal acceptation, are at present not very frequent: for if any goods come to land, it rarely happens, since the improvement of commerce, navigation, and correspondence, that the owner is not able to assert his property within the year and day limited by law. And in order to preserve this property entire for him, and if possible to prevent wrecks at all, our laws have made many very humane regulations; in a spirit quite opposite to those salvage laws which formerly prevailed in all the northern regions of Europe, and a few years ago were still said to subsist on the coasts of the Baltic Sea, permitting the inhabitants to seize on whatever they could get as lawful prize; or, as an author of their own expresses it, "*in naufragorum miseria et calamitate tanquam vulgares ad prædâ currere.*" For by the statute 27 Edw. III.

c. 13. if any ship be lost on the shore, and the goods come to land (which cannot, says the statute, be called *wreck*), they shall be presently delivered to the merchants, paying only a reasonable reward to those that saved and preserved them, which is entitled *ſalvage*. Also by the common law, if any persons (other than the sheriff) take any goods fo cast on shore, which are not legal wreck, the owners might have a commission to enquire and find them out, and compel them to make restitution. And by 12 Ann. st. 2. c. 18. confirmed by 4 Geo. I. c. 12. in order to assist the distressed, and prevent the scandalous illegal practices on some of our sea-coasts (too similar to those on the Baltic), it is enacted, that all head officers and others of towns near the sea, shall, upon application made to them, summon as many hands as are necessary, and send them to the relief of any ship in distress, on forfeiture of 100*l.* and, in case of assistance given, salvage shall be paid by the owners, to be assisted by three neighbouring justices. All persons that secrete any goods shall forfeit their treble value; and if they wilfully do any act whereby the ship is lost or destroyed, by making holes in her, stealing her pumps, or otherwise, they are guilty of felony without benefit of clergy. Lastly, by the statute 26 Geo. II. c. 19. plundering any vessel, either in distress or wrecked, and whether any living creature be on board or not (for whether wreck or otherwise, it is clearly not the property of the populace), such plundering or preventing the escape of any person that endeavours to save his life, or wounding him with intent to destroy him, or putting out false lights in order to bring any vessel into danger, are all declared to be capital felonies; in like manner as the destroying of trees, steeples, or other stated sea-marks, is punished by the statute 8 Eliz. c. 13. with a forfeiture of 100*l.* or outlawry. Moreover by the statute of Geo. II. pilfering any goods cast ashore is declared to be petty larceny; and many other salutary regulations are made, for the more effectually preserving ships of any nation in distress.

By the civil law, to destroy persons shipwrecked, or prevent their saving the ship, is capital. And to steal even a plank from a vessel in distress or wrecked, makes the party liable to answer for the whole ship and cargo. The laws also of the Wifigoths, and the most early Neapolitan constitutions, punished with the utmost severity all those who neglected to assist any ship in distress, or plundered any goods cast on shore.

WREN, in ornithology. See *MOTACILLA*.

WREN (Sir Christopher), a great philosopher, and one of the most learned and most eminent architects of his age, was the son of Christopher Wren, dean of Windsor, and was born in 1632. He studied at Wadham College in Oxford; where he took the degree of master of arts in 1653, and was chosen fellow of All Souls College. When very young he discovered a surprising genius for the mathematics; in which science he made great advances before he was sixteen years old. In 1657 he was made professor of astronomy at Gresham College, London, which he resigned in 1660, on his being chosen to the Savilian professorship of astronomy in Oxford: he was the next year created doctor of laws, and in 1663 was elected fellow of the Royal Society. He was one of the commissioners for the reparation of St. Paul's; and in 1665 travelled into France, to examine the most beautiful edifices there, when he made many curious observations. At his return to England, he drew a noble plan for rebuilding the city of London after the fire, which he presented to parliament; and, upon the decease of Sir John Denham in 1668, was made surveyor-general of his majesty's works; and from that time had the direction of

* In like manner Constantine the Great, finding that by the imperial law the revenue of wrecks was given to the prince's treasury or fiscus, restrained it by an edict (Cod. 11. 5. 1.), and ordered them to remain to the owners; adding this humane expostulation: "Quod enim jus habet fiscus in aliena calamitate, ut de re tam luctuosa compendium sectetur?"

a great number of public edifices, by which he acquired the highest reputation. He built the magnificent theatre at Oxford, St. Paul's cathedral, the churches of St. Stephen Walbrook, and St. Mary-le-Bow, the Monument, the modern part of the palace of Hampton Court, Chelsea College, one of the wings of Greenwich Hospital, and many other beautiful edifices. He was president of the Royal Society, one of the commissioners of Chelsea College, and twice member of parliament; first for Plymouth in Devonshire, and then for Melcomb Regis in the same county; but in 1718 was removed from his place of surveyor-general. He died in 1723, and was interred in the vault under St. Paul's.

This great man also distinguished himself by many curious inventions and discoveries in natural philosophy; and, among many others, contrived an instrument for measuring the quantity of rain that falls on any space of land for a year; he invented many ways of making astronomical observations more accurate and easy; and was the first author of the anatomical experiment of injecting liquors into the veins of animals, &c. He translated into Latin Mr. Oughtred's *Horologio-graphica Geometria*; and wrote a Survey of the Cathedral Church of Salisbury, and other pieces. After his death his posthumous works and draughts were published by his son.

WRESTLING, a kind of combat or engagement between two persons unarmed, body to body, to prove their strength and dexterity, and try which can throw his opponent to the ground. Wrestling is an exercise of very great antiquity and fame. It was in use in the heroic age; witness Hercules, who wrestled with Antæus. It continued a long time in the highest repute, and had considerable rewards and honours assigned to it at the Olympic games. It was the custom for the Athletæ to anoint their bodies with oil, to give the less hold to their antagonists. Lycurgus ordered the Spartan maids to wrestle in public quite naked, in order, as it is observed, to break them of their too much delicacy and niceness, to make them appear more robust, and to familiarize the people, &c. to such nudities.

WRIT, in law, signifies, in general, the king's precept in writing under seal, issuing out of some court, directed to the sheriff or other officer, and commanding something to be done in relation to a suit or action, or giving commission to have the same done. And, according to Fitzherbert, a writ is said to be a formal letter of the king in parchment, sealed with his seal, and directed to some judge, officer, or minister, &c. at the suit of a subject, for the cause briefly expressed, which is to be determined in the proper court according to law.

WRITS, in civil actions, are either original or judicial: original are such as are issued out of the court of chancery for the summoning of a defendant to appear, and are granted before the suit is commenced, in order to begin the same; and judicial writs issue out of the court where the original is returned, after the suit is begun. See **PROCESS**.

The original writ is the foundation of the suit. See **SUIT**.

When a person hath received an injury, and thinks it worth his while to demand a satisfaction for it, he is to consider with himself, or take advice, what redress the law has given for that injury; and thereupon is to make application or suit to the crown, the fountain of all justice, for that particular specific remedy which he is determined or advised to pursue. As for money due on bond, an action of debt; for goods detained without force, an action of *detinue* or *trover*; or, if taken with force, an action of *trespass vi et armis*; or, to try the title of lands, a writ of entry or action of trespass in ejectment; or for any consequential injury received, a special action on the case. To this end he is to sue out, or purchase by paying the stated fees, an *original*, or original writ, from the court of chancery, which is the *officina justitiæ*, the shop or mint of justice, where-

in all the king's writs are framed. It is a mandatory letter from the king in parchment, sealed with his great seal, and directed to the sheriff of the county wherein the injury is committed, or supposed to be, requiring him to command the wrong-doer or party accused, either to do justice to the complainant, or else to appear in court, and answer the accusation against him. Whatever the sheriff does in pursuance of this writ, he must return or certify to the court of common-pleas, together with the writ itself: which is the foundation of the jurisdiction of that court, being the king's warrant for the judges to proceed to the determination of the cause. For it was a maxim introduced by the Normans, that there should be no proceedings in common-pleas before the king's justices without his original writ; because they held it unfit that those justices, being only the substitutes of the crown, should take cognizance of any thing but what was thus expressly referred to their judgment. However, in small actions, below the value of forty shillings, which are brought in the court-baron or county-court, no royal writ is necessary; but the foundation of such suits continue to be (as in the times of the Saxons), not by original writ, but by plaint; that is, by a private memorial tendered in open court to the judge, wherein the party injured sets forth his cause of action: and the judge is bound of common right to administer justice therein, without any special mandate from the king. Now indeed even the royal writs are held to be demandable of common right, on paying the usual fees: for any delay in the granting them, or setting an unusual or exorbitant price upon them, would be a breach of magna charta, c. 29. "nulli vendemus, nulli negabimus, aut differemus justitiam vel rectum."

Original writs are either optional or peremptory; or, in the language of our law, they are either a *precept*, or a *fi te fecerit securum*. The *precept* is in the alternative, commanding the defendant to do the thing required, or show the reason wherefore he hath not done it. The use of this writ is where something certain is demanded by the plaintiff, which is in the power of the defendant himself to perform; as, to restore the possession of land, to pay a certain liquidated debt, to perform a specific covenant, to render an account, and the like; in all which cases the writ is drawn up in the form of a *precept* or command, to do thus, or show cause to the contrary; giving the defendant his choice to redress the injury or stand the suit. The other species of original writs is called a *fi fecerit te securum*, from the words of the writ; which directs the sheriff to cause the defendant to appear in court, without any option given him, provided the plaintiff gives the sheriff security effectually to prosecute his claim. This writ is in use where nothing is specifically demanded, but only a satisfaction in general; to obtain which, and minister complete redress, the intervention of some judicature is necessary. Such are writs of trespass, or on the case, wherein no debt or other specific thing is sued for in certain, but only damages to be assessed by a jury. For this end the defendant is immediately called upon to appear in court, provided the plaintiff gives good security of prosecuting his claim. Both species of writs are tested, or witnessed, in the king's own name; "witnesses ourself at Westminster," or wherever the chancery may be held.

The security here spoken of, to be given by the plaintiff for prosecuting his claim, is common to both writs, though it gives denomination only to the latter. The whole of it is at present become a mere matter of form; and John Doe and Richard Roe are always returned as the standing pledges for this purpose. The ancient use of them was to answer for the plaintiff, who in case he brought an action without cause, or failed in the prosecution of it when brought, was liable to an amercement from the crown for raising a false accusation;

and so the form of the judgment still is. In like manner, as by the Gothic constitutions no person was permitted to lay a complaint against another, *nisi sub scriptura aut specificatione trium testium, quod actionem vellet persequi*: and, as by the laws of Sancho I. king of Portugal, damages were given against a plaintiff who prosecuted a groundless action.

The day on which the defendant is ordered to appear in court, and on which the sheriff is to bring in the writ, and report how far he has obeyed it, is called the *return of the writ*; it being then returned by him to the king's justices at Westminster. And it is always made returnable at the distance of at least 15 days from the date or test, that the defendant may have time to come up to Westminster, even from the most remote parts of the kingdom; and upon some day in one of the four terms, in which the court sits for the dispatch of business.

WRITING, the art or act of signifying and conveying our ideas to others, by letters or characters visible to the eye. See **COMPOSITION**, **GRAMMAR**, and **LANGUAGE**. The most ancient remains of writing, which have been transmitted to us, are upon hard substances, such as stones and metals, which were used by the ancients for edicts and matters of public notoriety: the decalogue was written on two tables of stone; but this practice was not peculiar to the Jews, for it was used by most of the eastern nations, as well as by the Greeks and Romans; and therefore the ridicule which Voltaire attempts to cast upon that part of the book of Genesis, where the people are commanded to write the law on stones, is absurd; for what is there said by no means implies, that other materials might not be used on common occasions. The laws penal, civil, and ceremonial, among the Greeks, were engraven on tables of brass, which were called *Cybes*.

We find that wood was also used for writing on in different countries. In the Sloanian library (N^o 4852.) are six specimens of Kufic writing, on boards about two feet in length, and six inches in depth. The Chinese, before the invention of paper, wrote or engraved with an iron tool upon thin boards or on bamboo. Pliny says, that table books of wood were in use before the time of Homer. These table books were called by the Romans *pugillares*. The wood was cut into thin slices, and finely plained and polished. The writing was at first upon the bare wood, with an iron instrument called a *style*. In later times these tables were usually waxed over, and written upon with that instrument. The matter written upon the tables which were thus waxed over was easily effaced, and by smoothing the wax new matter might be substituted in the place of what had been written before. The Greeks and Romans continued the use of waxed table books long after the use of papyrus, leaves, and skins, became common, because they were so convenient for correcting extemporary compositions.

Table books of ivory are still used for memorandums, but they are commonly written upon with black lead pencils. The practice of writing on table books covered with wax was not entirely laid aside till the commencement of the 14th century.

The bark of trees was also used for writing by the ancients, and is so still in several parts of Asia. The same thing may be said of the leaves of trees. It is needless to observe the use of parchment and vellum, papyrus and paper, for writing; it is too well known. The method of fabricating these substances has been already described as they occurred in the order of the alphabet.

It is obvious, that when men wrote, or rather engraved, on hard substances, instruments of metal were necessary, such as the chisel and the stylus; but the latter was chiefly used for writing upon boards, waxed tablets, or on bark.

When the ancients wrote on softer materials than wood or metal, other instruments were used for writing with, of which reeds and canes seem to have been the first. Reeds and canes are still used as instruments for writing with by the Tartars, the Indians, the Persians, the Turks, and the Greeks. Pencils made of hair are used by the Chinese for their writing: they first liquify their ink, and dip their pencils into it. Hair-pencils have likewise been used for writing in Europe. Large capital letters were made with them from the time of the Roman emperors till the 16th century. After the invention of printing they were drawn by the illuminators. Quills of geese, swans, peacocks, crows, and other birds, have been used in these western parts for writing with, but how long is not easy to ascertain. St. Isidore of Seville, who lived about the middle of the 7th century, describes a pen made of a quill as used in his time.

Method of restoring decayed WRITINGS. In the 77th vol. of the Phil. Trans. there is a paper on this subject by Sir Charles Blagden. One of the best methods he found upon experiment to be, covering the letters with phlogisticated or prussic alkali, with the addition of a diluted mineral acid; upon the application of which, the letters changed very speedily to a deep blue colour, of great beauty and intensity. To prevent the spreading of the colour, which, by blotting the parchment, detracts greatly from the legibility, the alkali should be put on first, and the diluted acid added upon it. The method found to answer best has been, to spread the alkali thin with a feather over the traces of the letters, and then to touch it gently, as nearly upon or over the letters as can be done, with the diluted acid, by means of a feather or a bit of stick cut to a blunt point. Though the alkali should occasion no sensible change of colour, yet the moment the acid comes upon it, every trace of a letter turns at once to a fine blue, which soon acquires its full intensity, and is beyond comparison stronger than the colour of the original trace had been. If, then, the corner of a bit of blotting paper be carefully and dexterously applied near the letters, so as to imbibe the superfluous liquor, the staining of the parchment may be in a great measure avoided; for it is this superfluous liquor which, absorbing part of the colouring matter from the letters, becomes a dye to whatever it touches. Care must be taken not to bring the blotting paper in contact with the letters, because the colouring matter is soft whilst wet, and may easily be rubbed off. The acid chiefly employed was the marine; but both the vitriolic and nitrous succeed very well. They should be so far diluted as not to be in danger of corroding the parchment, after which the degree of strength does not seem to be a matter of much nicety.

Method of Copying WRITINGS. The ingenious Mr. Watt, about 16 years ago, invented a method of copying writings very speedily, and without the possibility of committing mistakes. A piece of thin unfixed paper is to be taken exactly of the size of the paper to be copied; it is to be moistened with water, or, what is better, with the following liquid: Take of distilled vinegar two pounds weight, dissolve it in one ounce of boric acid; then take four ounces of oyster-shells calcined to whiteness, and carefully freed from their brown crust; put them into the vinegar, shake the mixture frequently for 24 hours, then let it stand until it deposits its sediment; filter the clear part through unfixed paper into a glass vessel; then add two ounces of the best blue Aleppo galls bruised, and place the liquor in a warm place, shaking it frequently for 24 hours; then filter the liquor again through unfixed paper, and add to it after filtration one quart, ale measure, of pure water. It must then stand 24 hours, and be filtered again if it shows a disposition to deposit any sediment, which it generally does. When the paper has been wet with this liquid,

put it between two thick unfixed papers to absorb the superfluous moisture; then lay it over the writing to be copied, and put a piece of clean writing paper above it. Put the whole on the board of a rolling-press, and press them through the rolls, as is done in printing copperplates, and a copy of the writing shall appear on both sides of the thin moistened paper; on one side in a reversed order and direction, but on the other side in the natural order and direction of the lines.

WRITEN MOUNTAINS. See MOUNTAINS.

WRY-NECK, in ornithology. See JYNX.

WURTEMBERG, or WIRTEMBERG, a sovereign duchy of Germany, in Suabia; bounded on the north by Franconia; the archbishopric of Mentz, and the palatinate of the Rhine; on the east by the county of Oetting, the marquisate of Burgau, and the territory of Ulm; on the south by the principality of Hoen-Zollern, Furlenburg, and the marquisate of Hohenburg; and on the west by the palatinate of the Rhine, the marquisate of Baden, and the Black Forest. It is 65 miles in length, and as much in breadth, and the river Neckar runs almost through the middle of it from south to north. Though there are many mountains and woods, yet it is one of the most populous and fertile countries in Germany, producing plenty of grafs, corn, fruits, and a great deal of wine towards the confines of the palatinate. There are also mines, and salt springs, with plenty of game and fish. It contains 645 villages, 88 towns, and 26 cities, of which Stutgard is the capital.

WURTSBURG, a large bishopric in Germany, comprehending the principal part of Franconia. It is bounded by the county of Henneburg, the duchy of Coburg, the abbey of Fuld, the archbishopric of Mentz, the marquisate of Anspach, the bishopric of Bamberg, and the county of Wertheim; being about 65 miles in length, and 50 in breadth, and divided into 30 bailiwicks. The soil is very fertile, and produces more corn and wine than the inhabitants consume. The territories of the bishop comprehend above 400 towns and villages, of which he is sovereign, being one of the greatest ecclesiastical princes of the empire.

WURTZBURG, a large and handsome city of Germany, and one of the principal in the circle of Franconia. It is defended with good fortifications, and has a magnificent palace. There is a handsome hospital, in which are generally 400 poor men and women. The castle is at a small distance from the city, and commands it, as it stands upon an eminence. It communicates with the city by a stone bridge, on which are 12 statues, representing as many saints. The arsenal and the cells of the bishop deserve the attention of the curious. There is also an university, founded in 1403. It is seated on the river Maine, in E. Long. 10. 2. N. Lat. 49. 40.

WYCHERLEY (WILLIAM), an eminent English comic poet, and eldest son of Daniel Wycherley, esq. of Cleve in Shropshire, was born about 1640. At fifteen years of age, he was sent to France, in the western parts of which he resided, upon the banks of the Charante. A little before the restoration of Charles II. he became a gentleman-commoner of Queen's College in Oxford. He left the university without being matriculated, or any degree conferred on him; having been by Dr. Barlow reconciled to the Protestant religion, which he had a little before deserted in his travels. He afterwards entered himself of the Middle-Temple; but soon quit-

ted the dry study of the law, for the muses, and published four comedies, in about the space of ten years, viz. *Love in a Wood*, or *St. James's Park*, in 1672; *The Gentleman-Dancing-Master*, 1673; *Plain Dealer*, in 1678; and, *Country Wife*, in 1683. These were collected and printed together in 1712, 8vo. The king now promised to make him tutor to his son, for which service 1500l. per annum should be settled upon him: but soon after this gracious offer, Wycherley lost the favour of the king and of the courtiers, by a precipitate marriage with the countess of Drogheda, a young widow, rich, noble, and beautiful. This lady was jealous of him to that degree, that she could not endure him to be one moment out of her sight. By all accounts she led him a miserable life, but made him some amends, by dying in a reasonable time, and by settling her fortune on him: but his title being disputed after her death, the expence of the law and other incumbrances so far reduced him, that not being able to satisfy the importunity of his creditors, he was flung into prison, where he languished seven years; nor was he released, till James II. going to see his Plain Dealer, was so charmed with the entertainment, that he gave immediate orders for the payment of his debts; adding withal a pension of 200l. per annum, while he continued in England. But Wycherley being ashamed to give the Earl of Mulgrave, whom the king had sent to demand it, a full account of his debts, still laboured under the weight of them till his father died; and then too the estate that descended to him, was left under very uneasy limitations, since, being only a tenant for life, he could not raise any money for the payment of his debts. However, just at the eve of his death, he married a young gentleman of 1500l. fortune, part of which he applied to the uses he wanted it for. Eleven days after the celebration of these nuptials, Jan. 1, 1715, he died; and was interred in the vault of Covent-Garden church. Besides the plays above mentioned, he published a volume of poems in 1704, folio; and, in 1728, his Posthumous Works in prose and verse were published by Mr. Lewis Theobald, in 8vo.

WYNDHAM (Sir William), descended of an ancient family, was born about the year 1687, and succeeded young to the title and estate of his father. On his return from his travels, he was chosen member for the county of Somerset; in which station he served in the three last parliaments of Queen Anne, and as long as he lived: after the change of the ministry in 1710, he was appointed secretary at war; and in 1713 was raised to be chancellor of the exchequer. Upon the breach between the earl of Oxford and lord Bolingbroke, he adhered to the interests of the latter. He was removed from his employment on the accession of George I. and falling under suspicion on the breaking out of the rebellion in 1715, was apprehended. He made his escape; a reward was published for apprehending him; he surrendered, was committed to the Tower, but never brought to a trial. After he regained his liberty, he continued in opposition to the several administrations under which he lived; and died in 1740.

WYKEHAM (William of). See WILLIAM.

WYE, a river of Wales, which rising on the confines of Cardiganhire, and running south-east, divides the counties of Radnor and Brecknock; then crossing Herefordshire, it runs south, and falls into the mouth of the Severn at Chepstow.

X.

X, or **x**, is the 22d letter of our alphabet, and a double consonant. It was not used by the Hebrews or ancient-Greeks; for, as it is a compound letter, the ancients, who used great simplicity in their writings, expressed this letter by its component letters *cs*. Neither have the Italians this letter, but express it by *ff*. **X** begins no word in our language but such as are of Greek original; and is in few others but what are of Latin derivation; as *perplex*, *reflexion*, *defluxion*, &c. We often express this found by single letters, as *cks*, in *backs*, *pecks*; by *ks*, in *books*, *breaks*; by *cc*, in *accels*, *accident*; by *ct*, *action*, *unction*, &c. The English and French pronounce it like *cs* or *ks*; the Spaniards like *c* before *a*, viz. *Alexandro*, as if it were *Alecxandro*. In numerals it expresseth 10, whence in old Roman manuscripts it is used for *denarius*; and as such seems to be made of two *V*'s placed one over the other. When a dash is added over it, thus *X̄*, it signifies 10,000.

XANTHIUM, in botany: a genus of plants of the class *monœcia*, order *pentandria*, and arranged in the natural classification under the 49th order, *Compositæ*. The male flowers are composite, common calyx imbricated; corollula monopetalous, tubular, quinquefid. Female; calyx involucrem of two leaves, containing two flowers; corolla o; drupa, dry, prickly; nucleus bilocular. There are five species, only one of which is a native of Britain, the *strumarium* or less burdock. The stem of this plant is a foot and a half high, thick, often spotted; leaves heart-shaped, lobed, on long foot-stalks. Flowers, male and female, many together, in the axæ of the leaves. The leaves are bitter and astringent. A decoction of the whole plant affords a showy yellow colour, but it is better if only the flowers are used. Horses and goats eat it: cows, sheep, and swine, refuse it.

XANTHOXYLUM. See **ZANTHOXYLUM**.

XEBEC, or **ZEBEC**, a small three-masted vessel, navigated in the Mediterranean Sea, and on the coasts of Spain, Portugal, and Barbary. See Plate 10. fig. 10. in vol. ix. The sails of the xebec are in general similar to those of the poleacre, but the hull is extremely different from that and almost every other vessel. It is furnished with a strong prow: and the extremity of the stern, which is nothing more than a sort of railed platform or gallery, projects farther behind the counter and buttock than that of any European ship. Being generally equipped as a corsair, the xebec is constructed with a narrow floor, to be more swift in pursuit of the enemy; and of a great breadth, to enable her to carry a great force of sail for this purpose without danger of overturning. As these vessels are usually very low built, their decks are formed with a great convexity from the middle of their breadth towards the sides, in order to carry off the water which falls aboard more readily by their scuppers. But as this extreme convexity would render it very difficult to walk thereon at sea, particularly when the vessel rocks by the agitation of the waves, there is a platform of grating extending along the deck from the sides of the vessel towards the middle, whereon the crew may walk dry-footed whilst the water is conveyed through the grating to the scuppers. The xebecs, which are generally armed as vessels of war by the Algerines, mount from 16 to 24 cannon, and carry from 300 to 450 men, two-thirds of whom are generally soldiers. By the very complicated and inconvenient method of working these vessels, what one of their captains of Algiers

told Mr. Falconer will be readily believed, viz. that every xebec requires at least the labour of three square-rigged ships, wherein the standing sails are calculated to answer every situation of the wind.

XENOCRATES, a celebrated ancient Grecian philosopher, was born at Chalcedon in the 95th Olympiad. At first he attached himself to Ælchines, but afterwards became a disciple of Plato, who took much pains in cultivating his genius, which was naturally heavy. As long as Plato lived, Xenocrates was one of his most esteemed disciples; after his death he closely adhered to his doctrine; and, in the second year of the 110th Olympiad, he took the chair in the academy, as the successor of Speusippus.

Xenocrates was celebrated among the Athenians, not only for his wisdom, but for his virtues. He was an admirer of the mathematical sciences: and was so fully convinced of their utility, that when a young man, who was unacquainted with geometry and astronomy, desired admission into the academy, he refused his request, saying, that he was not yet possessed of the handles of philosophy. In fine, Xenocrates was eminent both for the purity of his morals and for his acquaintance with science, and supported the credit of the Platonic school, by his lectures, his writings, and his conduct. He lived to the first year of the 116th Olympiad, or the 82d of his age, when he lost his life by accidentally falling, in the dark, into a reservoir of water.

XENOPHANES, the founder of the Eleaic sect of philosophy among the Greeks, was born at Colophon probably about the 65th Olympiad. From some cause or other he left his country early, and took refuge in Sicily, where he supported himself by reciting, in the court of Hiero, elegiac and iambic verses, which he had written in reprehension of the theogonies of Hesiod and Homer. From Sicily he passed over into Magna Græcia, where he took up the profession of philosophy, and became a celebrated preceptor in the Pythagorean school. Indulging, however, a greater freedom of thought than was usual among the disciples of Pythagoras, he ventured to introduce new opinions of his own, and in many particulars to oppose the doctrines of Epimenides, Thales, and Pythagoras. Xenophanes possessed the Pythagorean chair of philosophy about seventy years, and lived to the extreme age of an hundred years, that is, according to Eusebius, till the 81st Olympiad. The doctrine of Xenophanes concerning nature is so imperfectly preserved, and obscurely expressed, that it is no wonder that it has been differently represented by different writers. Perhaps the truth is, that he held the universe to be one in nature and substance, but distinguished in his conception between the matter of which all things consist, and that latent divine force which, though not a distinct substance but an attribute, is necessarily inherent in the universe, and is the cause of all its perfection.

XENOPHON, an illustrious philosopher, general, and historian, was born at Athens in the 3d year of the 82d Olympiad. When he was a youth, Socrates, struck with his external appearance, determined to admit him into the number of his pupils. Meeting him by accident in a narrow passage, the philosopher put his staff across the path, and stopping him, asked, where those things were to be purchased which are necessary to human life? Xenophon appearing at a loss for a reply to this unexpected salutation, Socrates proceeded to

ask him, where honest and good men were to be found? Xenophon still hesitating, Socrates said to him, "Follow me, and learn." From that time Xenophon became a disciple of Socrates, and made a rapid progress in that moral wisdom for which his master was so eminent. Xenophon accompanied Socrates in the Peloponnesian war, and fought courageously in defence of his country. He afterwards entered into the army of Cyrus as a private volunteer in his expedition against his brother. This enterprize proving unfortunate, Xenophon, after the death of Cyrus, advised his fellow soldiers to attempt a retreat into their own country. They listened to his advice; and having had many proofs of his wisdom as well as courage, they gave him the command of the army, in the room of Proxenus who had fallen in battle. In this command he acquired great glory by the prudence and firmness with which he conducted them back, through the midst of innumerable dangers, into their own country. The particulars of this memorable adventure are related by Xenophon himself in his *Retreat of the Ten Thousand*. After his return into Greece, he joined Agesilaus, king of Sparta, and fought with him against the Thebans in the celebrated battle of *Chæronæa*. The Athenians, displeased at this alliance, brought a public accusation against him for his former conduct in engaging in the service of Cyrus, and condemned him to exile. The Spartans, upon this, took Xenophon, as an injured man, under their protection, and provided him a comfortable retreat at Scilluntæ in Elea. Here, with his wife and two children, he remained several years, and passed his time in the society of his friends, and in writing those historical works which have rendered his name immortal. A war at length arose between the Spartans and Eleans; and Xenophon was obliged to retire to Lepreus, where his eldest son had settled. He afterwards removed, with his whole family, to Corinth, where, in the first year of the hundred and fifth Olympiad, he finished his days.

XENOPHON the *Younger*, a Greek writer, so called to distinguish him from the celebrated Xenophon, was born at Ephesus, and lived, according to some authors, before Heliodorus, that is, about the beginning of the 4th century. He is only known by his *Ephesiaca*, a Greek romance in five books, which is esteemed, and contains the amours or adventures of Abraromes and Anthia. This romance was printed at London, in Greek and Latin, in 1724, 4to.

XERXES I. the fifth king of Persia, memorable for the vast army he is said to have carried into the field against Leonidas king of Sparta; consisting, according to some historians, of 800,000 men, while others make it amount to 3,000,000, exclusive of attendants. The fleet that attended this prodigious land force is likewise made to consist of 2000 sail; and all the success they met with was the taking and burning the city of Athens; for the army was shamefully repulsed near the straits of Thermopylae by Leonidas, and the fleet was dispersed and partly destroyed by Themistocles at the straits of Salamis, who had only 380 sail under his command. Xerxes was assassinated by Artabanus, chief captain of his guards, and his distinguished favourite. See Sparta.

XIMENES (Francis), a justly celebrated cardinal, bishop of Toledo, and prime minister of Spain, was born at Torrelaguna, in Old Castile, in 1437, and studied at Alcalá and Salamanca. He then went to Rome; but being robbed on the road, brought nothing back but a bull for obtaining the first vacant prebend; but the Archbishop of Toledo refused it him, and threw him in prison. Being at length restored to liberty, he obtained a benefice in the diocese of Sigüenza, where Cardinal Gonzales de Mendoza, who was the bishop, made him his grand vicar. Ximenes some time after entered among the Franciscans of Toledo; but being there troubled with visits, he retired to a solitude named *Castanet*, and applied himself to the study of divinity and the oriental tongues.

At his return to Toledo, Queen Isabella of Castile chose him for her confessor, and afterwards nominated him archbishop of Toledo; which, next to the papacy, is the richest dignity in the church of Rome. "This honour (says Dr. Robertson) he declined with a firmness which nothing but the authoritative injunction of the pope was able to overcome. Nor did this height of promotion change his manners. Though obliged to display in public that magnificence which became his station, he himself retained his monastic severity. Under his pontifical robes he constantly wore the coarse frock of St. Francis, the rents of which he used to patch with his own hands. He at no time used linen, but was commonly clad in hair-cloth. He slept always in his habit; most frequently on the floor or on boards, and rarely in a bed. He did not taste any of the delicacies which appeared at his table, but satisfied himself with that simple diet which the rule of his order prescribed. Notwithstanding these peculiarities, so opposite to the manners of the world, he possessed a thorough knowledge of its affairs, and discovered talents for business which rendered the fame of his wisdom equal to that of his sanctity." His first care was to provide for the necessities of the poor; to visit the churches and hospitals; to purge his diocese of usurers and places of debauchery; to degrade corrupt judges, and place in their room persons whom he knew to be distinguished by their probity and disinterestedness. He erected a famous university at Alcalá; and in 1499 founded the college of St. Ildephonsus. Three years after he undertook the *Polyglot Bible*; and for that purpose sent for many learned men to come to him at Toledo, purchased seven copies in Hebrew for 4000 crowns, and gave a great price for Latin and Greek manuscripts. At this Bible he laboured above 12 years. It contains the Hebrew text of the Bible; the version of the Septuagint, with a literal translation; that of St. Jerom, and the Chaldee paraphrases of Onkelos; and Ximenes added to it a dictionary of the Hebrew and Chaldee words contained in the Bible. This work is called *Ximenes's Polyglot*. In 1507 Pope Julius II. gave him the cardinal's hat, and King Ferdinand the Catholic entrusted him with the administration of affairs. Cardinal Ximenes was from this moment the soul of every thing that passed in Spain. He distinguished himself at the beginning of his ministry by discharging the people from the burdensome tax called *alcavala*, which had been continued on account of the war against Granada; and laboured with such zeal and success in the conversion of the Mahometans, that he made 3000 converts, among whom was a prince of the blood of the kings of Granada. In 1509 Cardinal Ximenes extended the dominions of Ferdinand, by taking the city of Oran in the kingdom of Algiers. He undertook this conquest at his own expence, and marched in person at the head of the Spanish army clothed in his pontifical ornaments, and accompanied by a great number of ecclesiastics and monks. Some time after, foreseeing an extraordinary scarcity, he erected public granaries at Toledo, Alcalá, and Torrelaguna, and had them filled with corn at his own expence; which gained the people's hearts to such a degree, that to preserve the memory of this noble action they had an eulogium upon it cut on marble, in the hall of the senate-house at Toledo, and in the market-place. King Ferdinand dying in 1516, left Cardinal Ximenes regent of his dominions; and the Archduke Charles, who was afterwards the emperor Charles V. confirmed that nomination. In this new character he acquitted himself with extraordinary integrity and ability, till at length, from the repeated intreaties of Ximenes himself, and the impatient murmurs of the Spanish ministry, Charles V. embarked, and landed in Spain, accompanied by his favourites. Ximenes was advancing to the coast to meet him, but at Bos Equillos was seized with a violent disorder, which his followers considered as the effects of poison. This accident obliging Ximenes to

stop, he wrote to the king, and with his usual boldness advised him to dismiss all the strangers in his train, whose number and credit already gave offence to the Spaniards, and earnestly desired to have an interview with him, that he might inform him of the state of the nation, and the temper of his subjects. To prevent this, not only the Flemings, but the Spanish grandees, employed all their address to keep Charles at a distance from Aranda, the place to which the cardinal had removed. His advice was now slighted and despised. Ximenes, conscious of his own integrity and merit, expected a more grateful return from a prince to whom he delivered a kingdom more flourishing than it had been in any former age, and lamented the fate of his country, about to be ruined by the rapaciousness and influence of foreign favourites. While his mind was agitated by these passions, he received a letter from the king; in which, after a few cold and formal expressions of regard, he was allowed to retire to his diocese; and he expired a few hours after reading it in 1517, in the 81st year of his age.

This famous cardinal ought not to be confounded with

Roderic XIMENES, archbishop of Toledo, in the 13th century, who wrote a History of Spain in nine books; nor with several other Spanish writers of the name of Ximenes.

XIPHIAS, in zoology, the SWORD-FISH; a genus of fishes belonging to the order of *apodes*. The upper jaw terminates in a long sword-shaped rostrum, from which it is called the *sword-fish*: there are no teeth in the mouth; the gill membrane has eight rays; and the body is somewhat cylindrical. There is but one species, viz. the *gladius*, found in the European ocean. This fish sometimes frequents our coasts, but is much more common in the Mediterranean Sea, especially in the part that separates Italy from Sicily, which has been long celebrated for it: the promontory Pelorus, now Capo di Faro, was a place noted for the resort of xiphias, and possibly the station of the speculators, or the persons who watched and gave notice of the approach of the fish.

The ancient method of taking them is particularly described by Strabo, and agrees exactly with that practised by the moderns. A man ascends one of the cliffs that overhang the sea: as soon as he spies the fish, he gives notice, either by his voice or by signs, of the course it takes. Another, that is stationed in a boat, climbs up the mast, and on seeing the sword-fish, directs the rowers towards it. As soon as he thinks they are got within reach, he defends, and taking a spear in his hand, strikes it into the fish; which, after wearying itself with its agitation, is seized and drawn into the boat. It is much esteemed by the Sicilians, who buy it up eagerly, and at its first coming into season give about sixpence English per pound. The season lasts from May till August. The ancients used to cut this fish into pieces and salt it; whence it was called *Tomus Thurianus*, from Thurii, a town in the bay of Tarentum, where it was taken and cured.

The sword-fish is said to be very voracious, and that it is a great enemy to the tunny, who (according to Belon) are as much terrified at it as sheep are at the sight of a wolf. It is a great enemy to the whales, and frequently destroys them. See BALÆNA.

XYLO-ALOES, or ALOE-WOOD, in the materia medica, is the product of a tree growing in China and some of the Indian islands. See EXCÆCARIA. This drug is distinguished into three sorts; the calambac or tambac, the common lignum aloes, and calambour.

1. The calambac, or finest aloe-wood, called by authors *lignum aloes præstantissimum*, and by the Chinese *fuk-hing*, is the most resinous of all the woods we are acquainted with: it is of a light spongy texture, very porous, and its pores so filled up with a soft and fragrant resin, that the whole may be pressed and dented by the fingers like wax, or moulded

about by chewing in the mouth, in the manner of mastick. This kind, laid on the fire, melts in great parts like resin, and burns away in a few moments with a bright flame and perfumed smell. Its scent, while in the mass, is very fragrant and agreeable; and its taste acrid and bitterish, but very aromatic and agreeable. It is so variable in its colour, that some have divided it into three kinds; the one variegated with black and purple; the second, with the same black, but with yellowish instead of purple; and the third, yellow alone like the yolk of an egg: this last is the least scented of the three. The variation, however, is owing to the trunk of the tree being itself of three different colours; and the heart of it is the valuable sort first described. The two following are supposed to be the other parts of the trunk; though this seems doubtful, especially in regard to the last sort, from the circumstance mentioned of its being found in large logs entire, and sometimes only the heart, which, as above noticed, constitutes the calambac.

2. The *lignum aloes vulgare* is the second in value. This is of a more dense and compact texture, and consequently less resinous than the other; there is some of it, however, that is spongy, and has the holes filled up with the right resinous matter; and all of it, when good, has veins of the same resin in it. We meet with it in small fragments, which have been cut and split from larger: these are of a tolerably dense texture in the more solid pieces, and of a dusky brown colour, variegated with resinous black veins. It is in this state very heavy, and less fragrant than in those pieces which show a multitude of little holes, filled up with the same blackish matter that forms the veins in others. The woody part of these last pieces is somewhat darker than the other, and is not unfrequently purplish, or even blackish. The smell of the common aloe-wood is very agreeable, but not so strongly perfumed as the former. Its taste is somewhat bitter and acrid, but very aromatic.

3. The calambour, called also *agalochum sylvestre*, and *lignum aloes mexicanum*, is light and friable, of a dusky and often mottled colour, between a dusky green black and a deep brown. Its smell is fragrant and agreeable, but much less sweet than that of either of the others; and its taste bitterish, but not so much acrid or aromatic as either of the two former. This is said to be met with very frequently, and in large logs; and these sometimes entire, sometimes only the heart of the tree. This is the aloe-wood used by the cabinet-makers and inlainers.

This drug is esteemed a cordial taken inwardly; and is sometimes given in disorders of the stomach and bowels, and to destroy the worms. A very fragrant oil may be procured from it by distillation; which is recommended in paralytic cases from five to fifteen drops. It is at present, however, little known in medicine.

XYNOECIA, in Grecian antiquity, an anniversary feast observed by the Athenians in honour of Minerva, upon the sixteenth of Hecatombæon, to commemorate their leaving, by the persuasion of Theseus, their country-seats, in which they lay dispersed here and there in Attica, and uniting together in one body.

XYSTARCHA, in antiquity, the master or director of the xythus. In the Greek gymnasium, the xystarcha was the second officer, and the gymnasiarcha the first; the former was his lieutenant, and presided over the two xythi, and all exercises of the athletes therein.

XYSTUS, among the Greeks, was a long portico, open or covered at the top, where the athletes practised wrestling and running: the gladiators, who practised therein, were called *xytici*. Among the Romans, the xystus was only an alley, or double row of trees, meeting like an arbour, and forming a shade to walk under.

Y.

Y, or *y*, the 23d letter of our alphabet: its sound is formed by expressing the breath with a sudden expansion of the lips from that configuration by which we express the vowel *u*. It is one of the ambigential letters, being a consonant in the beginning of words, and placed before all vowels, as in *yard*, *yield*, *young*, &c. but before no consonant. At the end of words it is a vowel, and is substituted for the sound of *i*, as in *try*, *desire*, &c. In the middle of words it is not used so frequently as *i* is, unless in words derived from the Greek, as in *chyle*, *empyreal*, &c. though it is admitted into the middle of some pure English words, as in *dying*, *flying*, &c. The Romans had no capital of this letter, but used the small one in the middle and last syllables of words, as in *corymbus*, *onyx*, *martyr*. **Y** is also a numeral, signifying 150, or, according to Baronius, 159; and with a dash a-top, as **Ȳ**, it signified 150,000.

YACHT, or **YATCH**, a vessel of state, usually employed to convey princes, ambassadors, or other great personages, from one kingdom to another. As the principal design of a yacht is to accommodate the passengers, it is usually fitted with a variety of convenient apartments, with suitable furniture, according to the quality or number of the persons contained therein. The royal yachts are commonly rigged as ketches, except the principal one reserved for the sovereign, which is equipped with three masts like a ship. They are in general elegantly furnished, and richly ornamented with sculpture; and always commanded by captains in his majesty's navy. Besides these, there are many other yachts of a smaller kind, employed by the commissioners of the excise, navy, and customs; or used as pleasure-boats by private gentlemen.

YAMS. See **DIOSCOREA**.

YAMBOO. See **EUGENIA**.

YARD of a SHIP, a long piece of timber suspended upon the masts of a ship, to extend the sails to the wind. See **MAST** and **SAIL**. All yards are either square or lateen; the former of which are suspended across the masts at right angles, and the latter obliquely. See Plate 4. fig. 1. in vol. IX. The square yards are nearly of a cylindrical surface. They taper from the middle, which is called the *flings*, towards the extremities, which are termed the *yard-arms*; and the distance between the flings and the yard-arms on each side is by the artificers divided into quarters, which are distinguished into the first, second, third quarters, and yard-arms. The middle quarters are formed into eight squares, and each of the end parts is figured like the frustum of a cone. All the yards of a ship are square except that of the mizen.

The proportions for the length of yards, according to the different classes of ships in the British navy, are as follows:

	Guns.
560: main-yard fig. 1.	100
559: Pl. 4. vol. IX.	90 80
570: Note, the figure	70
576: represents the	60
575: yard and sails of a	50
561: ship of 74 guns.	44
1000: main-yard :	100. 90. 80.
880: fore-yard :	all the rest.
874: fore-yard :	

Cross-jack and sprit-fail yards equal to the fore top-fail yard.—Sprit-top-fail yard equal to the fore top-gallant yard.

The diameters of yards are in the following proportions to

their length. The main and fore yards five-sevenths of an inch to one yard. The top-fail, cross-jack, and sprit-fail yards, nine-fourteenths of an inch to one yard. The top-gallant, mizen top-fail, and sprit-fail top-fail yards, eight-thirteenths of an inch to one yard. The mizen-yard five-ninths of an inch to one yard. All studding-fail booms and yards half an inch to one yard in length.

The lifts of the main-yard are exhibited in the above figure by *gg*; the horses and their stirrups by *h*, *i*; the reef-tackles and their pendants by *k*, *l*; and the braces and brace-pendants by *m*, *n*.

The lateen-yards evidently derive their names from having been peculiar to the ancient Romans. They are usually composed of several pieces fastened together by woodlings, which also serve as steps whereby the sailors climb to the peak or upper extremity, in order to furl or cast loose the sail.

The mizen-yard of a ship, and the main-yard of a bilander, are hung obliquely on the mast, almost in the same manner as the lateen-yard of a xebec, fettee, or polacre.

YARD, a measure of length used in Britain and Spain, consisting of three feet, chiefly to measure cloth, fluffs, &c.

YARD-Arm is that half of the yard that is on either side of the mast, when it lies athwart the ship.

YARDS also denotes places belonging to the navy, where the ships of war, &c. are laid up in harbour. There are belonging to his majesty's navy six great yards, viz. Chatham, Deptford, Woolwich, Portsmouth, Sheerness, and Plymouth; these yards are fitted with several docks, wharfs, launches, and graving places, for the building, repairing, and cleaning of his majesty's ships; and therein are lodged great quantities of timber, masts, planks, anchors, and other materials; there are also convenient store-houses in each yard, in which are laid up vast quantities of cables, rigging, sails, blocks, and all other sorts of stores needful for the royal navy.

YARE, among sailors, implies ready or quick: as, be yare at the helm; that is, be quick, ready, and expeditious at the helm. It is sometimes also used for bright by seamen: as, to keep his arms yare; that is, to keep them clean and bright.

YARE, a river of Norfolk, which runs from west to east through that county, passing by Norwich, and falling into the German sea at Yarmouth.

YARMOUTH, a sea-port town of Norfolk, with a market on Wednesdays and Saturdays, and a fair on Friday and Saturday in Easter-week for petty chapmen. It is seated on the river Yare, where it falls into the sea; and is a place of great strength, both by art and nature, being almost surrounded with water; and there is a draw-bridge over the river. It is esteemed the key of this coast, and is a clean handsome place, whose houses are well built, it being a considerable town for trade. It has one large church, and a neat chapel, and the steeple of St. Nicholas's is so high that it serves for a sea-mark. It is governed by a mayor. The harbour is a very fine one, though it is very dangerous for strangers in windy weather; and it has for its security a pretty strong fort. It is 27 miles east of Norwich, and 112 north-east of London. E. Long. 1. 55. N. Lat. 52. 45.

YARMOUTH, a town of the Isle of Wight, in Hampshire, with a market on Fridays, and one fair on July 25th for toys. It is seated on the western part of the island, on the sea-shore,

and is encompassed with water; for, not many years ago a channel was cut through the peninsula, over which there is a draw-bridge, and it is defended by a strong castle on the quay. It is a handsome place, whose houses are chiefly built with stone, and covered with slate; and it sends two members to parliament. The market is now disused. W. Long. 1. 28. N. Lat. 50. 49.

YARN, wool or flax spun into thread, of which they weave cloth. See CLOTH.

YARROW, in botany. See ACHILLEA.

YAWNING, an involuntary opening of the mouth, generally produced by weariness or an inclination to sleep. Yawning, according to Boerhaave, is performed by expanding at one and the same time all the muscles capable of spontaneous motion; by greatly extending the lungs; by drawing in gradually and slowly a large quantity of air; and gradually and slowly breathing it out, after it has been retained for some time and rarified; and then restoring the muscles to their natural state. Hence the effect of yawning is to move, accelerate, and equally distribute all the humours through all the vessels of the body, and consequently to qualify the muscles and organs of sensation for their various functions. When yawning is troublesome, Hippocrates says that long deep respiration or drawing in the air at long intervals cures it.

YEAR, in astronomy and chronology. See ASTRONOMY and KALENDAR. The ancient Roman year was the lunar year, which, as first settled by Romulus, consisted only of ten months; viz. 1. March, containing 31 days. 2. April, 30. 3. May, 31. 4. June, 30. 5. Quintilis, 31. 6. Sextilis, 30. 7. September, 30. 8. October, 31. 9. November, 30. 10. December, 30—in all 304 days; which came short of the true lunar year by 50 days, and of the solar, by 61 days. Numa Pompilius corrected this irregular constitution of the year, and composed two new months, January and February, of the days that were used to be added to the former year.

The ancient Egyptian year, called also the year of Nabonassar, on account of the epocha of Nabonassar, is the solar year of 365 days, divided into 12 months, of 30 days each, besides five intercalary days added at the end. The names, &c. of the months are as follows: 1. Thoth. 2. Paophi. 3. Athyr. 4. Chojac. 5. Tybi. 6. Mecheir. 7. Phamenoth. 8. Pharmuthi. 9. Pachon. 10. Panni. 11. Epiphi. 12. Mefori; besides the *ἡμέραι σταγυρίαι*.

The ancient Greek year was lunar; consisting of 12 months, which at first had 30 days apiece, then alternately 30 and 29 days, computed from the first appearance of the new moon; with the addition of an embolismic month of 30 days every 3d, 5th, 8th, 11th, 14th, 16th, and 19th year of a cycle of 19 years; in order to keep the new and full moons to the same terms or seasons of the year. Their year commenced with that new moon, the full moon of which comes next after the summer solstice. The order, &c. of their months was thus: 1. *Ἑκατομβῆσις* containing 29 days. 2. *Μετακτινῆς* 30. 3. *Βοηδρομιῖος*, 29. 4. *Μαινακτηριῖος*, 30. 5. *Ποσειδωνῖος*, 29. 6. *Ποσειδωνῖος*, 30. 7. *Γαμηλιῖος*, 29. 8. *Διαιετιῖος*, 30. 9. *Εκαρβολιῖος*, 30. 10. *Μενυχιῖος*, 30. 11. *Θαργηλιῖος*, 29. 12. *Συμφεριῖος*, 30.

The ancient Jewish year is a lunar year, consisting commonly of 12 months, which alternately contain 30 and 29 days. It was made to agree with the solar year, either by the adding of 11, and sometimes 12 days, at the end of the year, or by an embolismic month. The names and quantities of the months stand thus: 1. Nisan, or Abib, 30 days. 2. Iar, or Zius, 29. 3. Siban, or Siwan, 30. 4. Hammuz, or Tammuz, 29. 5. Ab, 30. 6. Elul, 29. 7. Tisri, or Ethanin, 30. 8. Marchesivam, or Bull, 29. 9. Cilleu, 30.

10. Tebeth, 29. 11. Sabat, or Schebeth, 30. 12. Adar, in the embolismic year, 30. Adar, in the common year, was but 29. Note, in the defective year, Cilleu was only 29 days; and in the redundant year, Marchesivam was 30.

The Persian year is a solar year of about 365 days; consisting of 12 months of 30 days each, with 5 intercalary days added at the end.

The Arabic, Mahometan, and Turkish years, called also the year of the *Hegira*, is a lunar year, equal to 354 days 8 hours, and 48 minutes, and consists of 12 months, which contain alternately 30 and 29 days.

The Hindoo year differs from all these, and is indeed different in different provinces of India. The best account that we have of it is by Mr. Cavendish, in the Phil. Trans. of the Royal Society of London for the year 1792.

NEW YEAR'S GIFT. See GIFT.

YEAST, or YEST, a head or scum rising upon beer or ale while working or fermenting in the vat. See BREWING. It is used for a leaven or ferment in the baking of bread, as serving to swell or puff it up very considerably in a little time, and to make it much lighter, softer, and more delicate. See BAKING, BARM, and BREAD.

Mr. Henry has published a method of preparing artificial yeast, by which good bread may be made without the assistance of any other ferment. The method is this: Boil flour and water together to the consistence of treacle, and when the mixture is cold, saturate it with fixed air. Pour the mixture thus saturated into one or more large bottles or narrow-mouthed jars; cover it over loosely with paper, and upon that lay a plate or board with a weight to keep it steady. Place the vessel in a situation where the thermometer will stand from 70° to 80°, and stir up the mixture two or three times in 24 hours. In about two days such a degree of fermentation will have taken place, as to give the mixture the appearance of yeast. With the yeast in this state, and before it has acquired a thoroughly vinous smell, mix the quantity of flour intended for bread, in the proportion of six pounds of flour to a quart of the yeast, and a sufficient portion of warm water. Knead them well together in a proper vessel, and covering it with a cloth, let the dough stand for 12 hours, or till it appears to be sufficiently fermented in the fore-mentioned degree of warmth. It is then to be formed into loaves and baked. Mr. Henry adds, that perhaps the yeast would be more perfect, if a decoction of malt were used instead of simple water.

It has lately been discovered, that a decoction of malt alone, without any addition, will produce a yeast proper enough for the purpose of brewing. This discovery was made by Joseph Senyor, servant of the reverend Mr. Mason, of Alton near Rotherham; and he received for it a reward of 20l. from the Society for promoting Arts, Manufactures, and Commerce. The process is as follows: Procure three earthen or wooden vessels of different sizes and apertures, one capable of holding two quarts, the other three or four, and the third five or six; boil a quarter of a peck of malt for about eight or ten minutes in three pints of water; and when a quart is poured off from the grains, let it stand in the first or smaller vessel in a cool place till not quite cold, but retaining that degree of heat which the brewers usually find to be proper when they begin to work their liquor. Then remove the vessel into some warm situation near a fire, where the thermometer stands between 70 and 80 degrees Fahrenheit, and there let it remain till the fermentation begins, which will be plainly perceived within 30 hours: add then two quarts more of a like decoction of malt, when cool, as the first was; and mix the whole in the second or larger vessel, and fill it well in, which must be repeated in the usual way, as it rises in a common vat: then add a still greater quantity of the same decoction, to be

worked in the largest vessel, which will produce yeast enough for a brewing of 40 gallons.

Common ale yeast may be kept fresh and fit for use several months by the following method: Put a quantity of it into a clove canvas bag, and gently squeeze out the moisture in a forew-press till the remaining matter be as firm and stiff as clay. In this state it may be clove packed up in a tight cask for securing it from the air; and will keep fresh, found, and fit for use, for a long time. This is a secret that might be of great use to the brewers and distillers, who, though they employ very large quantities of yeast, seem to know no method of preserving it, or raising nurseries of it; for want of which they sustain a very considerable loss; whereas the brewers in Flanders make a very great advantage of supplying the malt-distillers of Holland with yeast, which is rendered lasting and fit for carriage by this easy expedient.

YELL, one of the islands of Shetland, lying north-east from the main land, and divided from it by an arm of the sea, called *Yell-Sound*. By some it is thought to have been the *Thule* of the ancients. In the old descriptions it is said to be 20 miles long and 8 broad. It is very mountainous and full of moss; but there are pretty considerable pastures in which they feed a great many sheep; and it also affords plenty of peat. It has eight large harbours, which would not be thought despicable in other countries. Anciently it seems to have been pretty populous, since there are in it three churches, twenty chapels, and many burghs or Pictish forts.

YELLOW, one of the original colours of light.

Naples YELLOW, a beautiful colour much used by painters, formerly thought to be prepared from arsenic, but now discovered to have lead for its basis.

YELLOW-Hammer, in ornithology. See **FRINGILLA**.

YELLOW-Peter. See **MEDICINE**.

YEMEN, a province of Arabia, stretching along the Red Sea and Indian Ocean, and forming a part of the country once known by the name of Arabia Felix.

YEOMEN, the first or highest degree among the plebeians of England, next in order to the gentry. The yeomen are properly freeholders, who having land of their own, live on good husbandry.

YEOMEN is also a title of office in the king's household, of a middle place or rank between an usher and a groom.

YEOMEN of the Guard were anciently 250 men of the best rank under gentry, and of larger stature than ordinary, each being required to be six feet high. At present there are but 100 yeomen in constant duty, and 70 more not on duty; and as any of the 100 dies, his place is supplied out of the 70. They go dressed after the manner of King Henry VIII's time. They formerly had diet as well as wages when in waiting; but this was taken off in the reign of Queen Anne.

YEW, in botany. See **TAXUS**.

YNCA, an appellation anciently given to the kings of Peru, and the princes of their blood; the word literally signifying, lord, king, emperor, and royal blood.

YOAK, or **Yoke**, in agriculture, a frame of wood fitted over the necks of oxen, whereby they are coupled together, and harnessed to the plough.

YOKE of Land, in our ancient customs, was the space which a yoke of oxen, that is, two oxen, may plow in one day.

YOLK, the yellow part in the middle of an egg (see **EGG**). It contains a lymphatic substance mixed with a certain quantity of mild oil, which, on account of this mixture, is soluble in water. When exposed to heat, it assumes a consistence not so hard as the white of the egg; and when bruised gives out the oil which it contains. This oil has been used externally as a liniment.

YONNE, a river in France, which rising in Burgundy,

and running north through Nivernois and Champaign, falls into the Seine at Montereau fur Yonne.

YORK, a city of England, and see of an archbishop, situated on the river Ouse, in the west-riding, near the centre of the county to which it gives name. It has always been considered as the capital of the north part of England, and the second in rank. The origin of this city is not well known; certain it is, however, that it was the station of the sixth legion, called *Victrix*, which Adrian brought out of Germany, and a Roman colony. The emperor Constantius Chlorus, is said to have died here, and his son, Constantine the Great, being in England at the time of his father's death, to have been proclaimed emperor. This city, under the Saxon government, was for a considerable time in a very flourishing state, till the Danish storm, bursting on it from the north, wasted it in a dreadful manner with fire and sword. And in the next century it felt greater and more terrible calamities in the Danish ravages. In the year 867, the walls had suffered so much from the assaults of war, that Ofthrit and Ella, kings of Northumberland, pursuing the Danes, got the city without any difficulty; and being slain in a bloody battle in the middle of the city, left the victory to the Danes who had retired into it. Hence Malmfbury observes, that York was always first exposed to the fury of the northern nations, received the barbarous flocks of the Danes, and groaned under repeated devastations: but, as the same author asserts, our Athelstan wrestled it from the Danes, and levelled with the ground the strong castle which they had erected there. It was not, however, altogether free from wars in succeeding years, that whole century being remarkable for the ruin of cities; but the Normans, as they put a stop to these calamities, so they almost utterly destroyed York; for the sons of Swain arriving with a fleet of 210 Danish ships in the neighbourhood, the Norman garrison that held two castles in the city, fearing lest the houses in the suburbs might favour the enemy in filling up the ditch, set them on fire; but the wind blowing strong, spread the flames over the whole city, so that it was all in a blaze, when the Danes broke in and made a dreadful massacre of the inhabitants, putting the Normans to the sword, reserving only William Mallet and Gilbert Gant, principal officers of distinction, to be decimated with the soldiers. For they set apart every tenth man of the Normans by lot for execution. This so provoked William I. that he extirpated the inhabitants, as if they had taken part with the Danes, and burned the city a second time, and, according to Malmfbury's account, so devastated the neighbouring villages, and so exhausted this fruitful province by his devastations, that the ground lay uncultivated for sixty miles together. Peace succeeding these turbulent times, York recovered itself, though often devoted to destruction by the Scots and seditions. In the reign of Stephen, it suffered by an accidental fire, which consumed the cathedral, St. Mary's abbey, and other religious houses, together, as is generally thought, with a well-furnished library, founded by Archbishop Egelred. St. Mary's abbey soon recovered its former magnificence by a new building, but the cathedral lay neglected till the time of Edward I. when John Roman, treasurer of the church, laid the foundation of the new work, which his son John, William Melton, and John Thorethy, all archbishops, gradually brought to perfection by the assistance of the neighbouring nobility. About the same time also, the citizens fortified the city with new walls, and a number of towers, thick set, and planned a body of excellent laws for their government. King Richard II. made it a county, corporate by itself, and Richard III. began the castle anew: and Henry VIII. established here a council or senate-house, not unlike the French parliaments, to try and determine the causes of this part of the kingdom, consisting of a

president and council, whose numbers depended on the king's pleasure, a secretary, and other officers. Before William the Conqueror burned York, authors do not scruple to compare it to Rome. It was the chief emporium in the north of England, and fifty years after the terrible fire in King Stephen's time, in the year 1186, this city had so raised its head, as to bear half-proportion to London. A woollen manufacture was held here to the reign of Henry VIII. But the navigation of the Ouse was neglected till the reign of George I. when an act of parliament was obtained for its improvement, but not effectually carried into execution at that time. The walls of this ancient city are all entire, being repaired every year if there is occasion. Those on the south and east from Fishergate to the Red Tower, and thence to Walmgate, were rebuilt in the years 1487 and 1673; and in the former of these divisions is a walk. The city is divided into four wards, Micklegate, Botham, Monk, and Walmgate, and has four principal gates, and six posterns. The latter of these gates is supposed to derive its name by corruption from Watling-street. In the reign of Henry V. it had forty-four parish churches, besides seventeen chapels, sixteen hospitals, and nine religious houses. At the reformation, these were reduced to little more than half the number of parish churches, eighteen of them being united to the rest, three hospitals, and one or two chapels. Clifford's Tower, a round shell, is beautifully situated on an artificial mount, commanding an extensive view over the river. It is said to be as old as the Conquest, and might have been raised by the Conqueror, or, as its mount exactly corresponds with the old bank on the west side of the river, it may have been Roman work. It was used as a garrison in the civil war, and till the year 1683, when the magazine blowing up, reduced it to its present form. The bridge over the Ouse consists of five arches, the middlemost eighty-one feet, or twenty-seven yards wide, and seventeen high. It was built about the year 1566, after the old one had been broken down by a sudden thaw. On its north side is an old chapel, with Saxon zigzag, probably built by the citizens, in the year 1268, in memory of certain Scots then slain in an affray on the bridge. It was turned into an exchange. The cathedral, alike venerable for size, style, and ornaments, was two centuries in building, from the year 1227, when Archbishop Grey began the south cross, to 1426, when the grants of the dean and chapter call it *new built*. The whole length, from east to west, is 524 feet, the breadth 109, length of the cross-aisle and the height of the lantern spire 180. The east window is said hardly to have its equal for tracery, painting, and preservation, and was the work of John Thornton, a glazier, of Coventry, in the year 1405. The archiepiscopal see of York was instituted in form, though not in substance, by Pope Gregory, in his letter to Augustine, in the year 602, but in substance by Pope Honorius, who sent to Paulinus, in the year 634. By a charter of Richard I. it was governed by a mayor, to which the title of lord was prefixed by Richard II. Other members of the corporation are aldermen, assistants, town-clerks, common-council, &c. The guild-hall was built in the year 1446; the lord-mayor's house in the year 1726; and an elegant assembly-room in the year 1736, from a design of the Earl of Burlington. Manufactures have not succeeded in York. The district situated to the south and south west of the city is called the *Ashley of York*. It sends two members to the British parliament, and has four markets weekly, Tuesday, Thursday, Friday, and Saturday: 197 miles N. London, and 101 S. Edinburgh.

YORKSHIRE, the largest county of England, bounded on the south by Derbyshire, Nottinghamshire, and Lincolnshire; on the north by Durham and Westmoreland; on the east by the German Ocean; and on the west by Lancashire and a

part of Cheshire.—It is upwards of 80 miles in length from east to west, nearly as much in breadth, and about 300 in circumference, containing, in the whole, 26 hundreds or wapentakes, 49 market-towns, 563 parishes, 242 vicarages, with many chapels of ease, and 2330 villages. Its area is computed by some at 4684 square miles, by others at 3,770,000 acres, and its inhabitants at upwards of 530,000. It is divided into three parts or ridings, viz. the West, East, and North; so denominated from their situation, in respect of the city of York. Each of these is as large, if not larger, than any ordinary county. There are other divisions, as Richmondshire, Allertonshire, Howdenshire, Hallamshire, Craven, Cleveland, Marshland, Holderness, &c.

As the soil and face of the country vary greatly, so does the air. In the hilly parts the air is good, but the soil very indifferent; of the lower some are marish, others drier, and the soil of both rich; but the air of the former is more foggy and unhealthy than that of the latter. The manufactures of this country are cutlery and hard-wares; particularly knives, bits, and spurs; but the principal are stockings and woollen cloth, with which it supplies, in a great measure, Germany and the North. As to the produce, it abounds in corn, cattle, horses, lead, and iron, coal, wood, lime, liquorice, alum, jet, &c. It lies wholly in the northern circuit, and much the greater part of it in the diocese of York; that only which is called *Richmondshire* belonging to the diocese of Chester. The members it sends to parliament are 30; of which two are for the shire and 28 for the towns.

NEW-YORK, a state of United America, bounded on the north by the 45th degree of latitude, which separates it from Canada, on the east by Connecticut, Massachusetts, and Vermont, on the south-east by the Atlantic, on the south and south-west, by New Jersey and Pennsylvania, and on the north-west by the river St. Lawrence, and the lakes Erie and Ontario: containing in the whole 44,000 square miles, or about 28 millions of acres. The state, to speak generally, is intersected by ridges of mountains, running in a north-east and south-west direction. Beyond the Alleghany Mountains, however, the country is a dead level, of a fine rich soil; covered, in its natural state, with maple, beech, birch, cherry, black walnut, locust, hickory, and some mulberry trees. On the banks of lake Erie, are a few chestnut and oak ridges. Hemlock swamps, are interspersed thinly through the country. All the creeks that empty into lake Erie, have falls, which afford many excellent mill-seats. East of the Alleghany Mountains, the country is broken into hills, with rich intervening valleys; the hills are clothed thick with timber, and when cleared, afford fine pasture; the valleys, when cultivated, produce wheat, hemp, flax, peas, grais, oats, and Indian corn; besides the trees already mentioned, there are, in various parts of the state, the several kinds of oak, such as white, red, yellow, black, and chestnut oak; white, yellow, spruce, and pitch, pines; cedar, balsam, or fir-tree; butternut, poplar, white-wood, which in Pennsylvania is called poplar, and in Europe the tulip-tree; sugar and rock maple, the linden tree, which, with the white-wood, grows on the low rich ground; the button-wood, or sycamore, shrub cranberry, the fruit of which hangs in clusters, like grapes, as large as cherries; this shrub, too, grows on low ground. Besides these is the sumach, which bears clusters of red berries; the Indians chew the leaves instead of tobacco; the berries are used in dyes. Of the commodities produced from culture, wheat is the staple, of which immense quantities are raised and exported. Indian corn and peas, are likewise raised for exportation; and rye, oats, barley, &c. for home consumption. In some parts of the state, large dairies are kept, which furnish for the market, butter and cheese. The best lands in this state, which lie

along the Mohawk river, and west of the Alleghany mountains, are yet in a state of nature, or are just beginning to be settled. This state, agreeably to an act of their legislature, passed in March, 1788, is divided into 16 counties; which, by another act passed at the same time, were divided into townships. In the above-mentioned acts, the limits of the counties and townships are defined. These townships are corporations invested with certain privileges. The act directs, that the freeholders in the several townships shall assemble in town meetings, on the first Tuesday in April, annually, and choose their town-officers. The number of inhabitants in this state, in 1786, was 238,897; of which 18,889 were negroes. In 1756, there were 83,233 whites, and 13,542 blacks; 96,775 in the whole. In 1771, there were 148,124 whites, and 19,883 blacks; total, 168,007. The population for every square mile, including the whole state, is only five, so that this state is but a ninth part as populous as Connecticut. But it is to be considered, that Connecticut has no waste lands, and not half the state of New York is settled. The state of Connecticut, however, throughout, is at least three times as thickly populated, as the settled parts of New York. This state contains vast quantities of iron ore. There is a silver mine at Philippsburg, which produces virgin silver, spar, zink, or spelter, a semi-metal, magnéz, used in glazings, peritus, of a golden hue; various kinds of copper ore, and lead and coal mines, are found in this state. Also petrified wood, plaster of Paris, singlals in sheets, talcs, and crystal of various kinds and colours, asbestos, and several other fossils. A small black stone had also been found, which vitrifies with a small heat, and makes excellent glass. The principal rivers are, Hudson, Onondago, Mohawks, Delaware, Susquehanna, Alleghany, Tyoga, &c. The constitution of this state provides for the free exercise of religious profession and worship, without discrimination or preference, within the state, for all mankind; provided the liberty for conscience hereby granted shall not be so construed as to excuse acts of licentiousness, or justify practices inconsistent with the peace and safety of the state. The ministers of every denomination in the state, are supported by the voluntary contributions of the people, raised generally by subscription, or by a tax upon the pews, except the Dutch churches in New York, Albany, Schenectady, and Kingston, which have, except the two last, large estates confirmed by a charter. The episcopal church, also, in New York, possess a very large estate in and near the city. The supreme legislative powers of the state are vested in two branches, a senate and assembly. The members of the senate are elected by the freeholders of the states, who possess freehold estates to the value of 1000. clear of debts. For the purpose of electing senators, the state is divided into four great districts, each of which chooses a certain number. The senators are divided by lot into four classes, six in each class, and numbered, first, second, third, and fourth. The seats of the first class, are vacated at the expiration of one year; the second at the expiration of the next, &c. and their places filled by new elections. Thus a small change is made in the senate every year; but three-fourths of the members remaining, preserve a knowledge of the business of the former session. A majority of the senate is necessary to do business; and each branch of the legislature has a negative upon the other. The legislature can at any time alter this division of the state, for the choice of senators; and an increase of electors in any district, to the amount of one twenty-fourth of the electors in the whole state, entitles the district to another senator. But the number of senators can never exceed one hundred. The assembly of the state is composed of representatives, from the several counties, chosen annually in May. By the constitution, however, it is ordered, that at the end of seven years,

after the termination of the late war, a census of the electors and inhabitants shall be taken, and the representation apportioned, according to the number of electors in each county. The supreme executive power of the state is vested in a governor (in whose absence, a deputy-governor is appointed to serve) chosen once in three years, by the freemen of the state. The lieutenant-governor is, by his office, president of the senate; and, upon an equal division of voices, has a casting vote; but has no voice on other occasions. The governor has not a seat in the legislature; but, as a member of the council of revision, and council of appointment, he has a vast influence in the state. Hudson's river was first discovered in 1608, by Henry Hudson, an Englishman, who sold his claim to the Dutch. In 1614 the States-General granted a patent to several merchants, for an exclusive trade on the river Hudson. The same year this company built a fort on the west side of the river, near Albany, and named it Fort Orange. In 1614 Captain Argall, under Sir Thomas Dale, governor of Virginia, visited the Dutch on Hudson's river, who being unable to resist him, prudently submitted, for the present, to the King of England, and, under him, to the Governor of Virginia. Determined upon the settlement of a colony, the States-General, in 1621, granted the country to the West-India company; and, in the year 1629, Wouter Van Twiller arrived at Fort Amsterdam, and took upon himself the government. On August 27, 1664, Governor Stuyvesant surrendered the colony to Colonel Nicolls, who had arrived in the bay a few days before, with three or four ships, and about 300 soldiers, having a commission from King Charles II. to reduce the place, which was then called *New Amsterdam*, but was changed to New York, as was Fort Orange to Albany, in honour of his Royal Highness James duke of York and Albany. Very few of the inhabitants thought proper to remove out of the country; and their numerous descendants are still in many parts of this state and New Jersey. In 1667, at the peace of Breda, New York was confirmed to the English, who, in exchange, ceded Surinam to the Dutch. The English kept peaceable possession of the country until the year 1673, when the Dutch, with whom they were then at war, sent a small squadron, which arrived at Staten Island on the 30th of July. John Manning, a captain of an independent company, who had, at that time, the command of the fort, sent a messenger down to the commodore, and treacherously made his terms with him. On the same day the ships came up, moored under the fort, landed their men, and entered the garrison, without giving or receiving a shot. All the magistrates and constables from East Jersey, Long Island, *Esopus*, and Albany, were summoned to New York, and the major part of them swore allegiance to the States-General and the Prince of Orange. The conquerors, however, did not long enjoy the fruits of their success, for, on the 9th of February, the year following, a treaty of peace between England and Holland was signed at Westminster; by the sixth article of which, this province was restored to the English, in whose hands it remained until the late revolution. While New York remained in possession of the Dutch, it was called *New Belghem*, or *New Netherlands*, and governed by an *alcot*, burgomasters, and *scheyvens*. From its surrender to the English, in 1664 to 1683, the province was ruled by governors, appointed and commissioned by the Duke of York, and their council, whose rules and orders had the force of laws. From the last-named period, the people were admitted to a share of the legislative authority. The confederated cantons of Indians, before the incorporation of the Tuscaroras, a people driven by the Carolinians from the frontiers of Virginia, consisted of five nations, viz. the Mohawks, Oneidas, Senecas, Onondagas, and Cayugas. The alliance and trade of these fix

nations inhabiting the territory west of Albany, to the distance of more than 200 miles, though much courted by the French of Canada, have been almost uninterruptedly enjoyed by the English. The chief towns are New York, Albany, and Hudson.

YORK (Ara), a city of America, and capital of a state of the same name, situated at the south-west point of an island, at the confluence of the Hudson and East river. The principal part of the city lies on the east side of the island, although the buildings extend from one river to the other. The length of the city on East river is about two miles, but falls much short of that distance on the banks of the Hudson: its breadth, on an average, is nearly three-fourths of a mile, and its circumference may be four miles. The plan of this city is not perfectly regular, but is laid out agreeably to the situation of the ground. The principal streets are nearly parallel with the rivers: these are intersected, though not at right angles, by streets running from river to river: the width of the streets is various. The houses are generally built of brick; and the roofs tiled: there are remaining a few houses built after the old Dutch manner, but the English taste has prevailed almost a century. Upon the south-west point of the land stands the fort, which is a square, with four bastions; within the walls of which the governors used formerly to reside. Below the fort, near the water, there is a line of fortifications of considerable extent, designed to command the entrance into both rivers. But it is questionable, whether any number of cannon would prevent ships from passing with a favourable wind and tide; and, indeed, whether New York is capable of defence, by land, against a powerful marine force. The city hall is a brick building, more strong than elegant; it is three stories in height, with wings at each end. There are three houses of public worship, belonging to the reformed Protestant Dutch church, four Presbyterian, and three Episcopal churches, with nine places of worship for other Christians, and a synagogue for the Jews. The government of the city (which was incorporated in 1696) is now in the hands of a mayor, aldermen, and common-council. The city is divided into seven wards, in each of which there is chosen annually, by the people, an alderman and assistant, who, together with the mayor and recorder, form the common-council: the mayor and recorder are appointed, annually, by the council of appointment. This city is esteemed the most eligible situation for commerce in the United States; it almost necessarily commands the trade of one half of New Jersey, most of that of Connecticut, and part of that of Massachusetts, besides the whole fertile interior country, which is penetrated by one of the largest rivers in America. This city imports most of the goods consumed between a line of thirty miles east of Connecticut river, and twenty miles west of the Hudson, which is 130 miles; and between the ocean and the confines of Canada, about 250 miles: a considerable portion of which is the best peopled of any part of the United States, and the whole territory contains at least half a million of people. In times of peace, New York will command more commercial business than any town in the United States. In time of war it will be insecure without a marine force; but a small number of ships will be able to defend it from the most formidable attacks by sea. A want of good water is a great inconvenience to the citizens, there being few wells in the city: most of the people are supplied every day with fresh water, conveyed by their doors in casks, from a pump, which receives it from a spring almost a mile from the city. It is found, by a memorandum in one of the old registers, that the total number of inhabitants in the city, taken by order of the king, in the year 1697, was 4302. The number of inhabitants in the city and

county of New York, in 1756, was 10,881; in 1771, 21,863; and in the year 1786, 23,614: 70 miles NN E. Philadelphia. Long. 74. W. Greenwich. Lat. 40. 40. N.

YOUNG (Dr. Edward), was the son of a clergyman of the same name, and was born about the year 1699. When sufficiently qualified, he was matriculated into All Souls college, Oxford; and designing to follow the civil law, he took a degree in that profession. In this situation he wrote his poems called *The Last Day*, published in 1704; which coming from a layman gave universal satisfaction: this was soon after followed by another, entitled, *The Force of Religion, or Vanquished Love*. These productions gained him a respectable acquaintance; he was intimate with Addison, and thus became one of the writers of the *Spectator*: but the turn of his mind leading him to the church, he took orders, was made one of the king's chaplains, and obtained the living of Welwyn in Hertfordshire, worth about 500*l. per annum*, but he never rose to higher preferment. For some years before the death of the late Prince of Wales, Dr. Young attended his court pretty constantly; but upon his decease all his hopes of church preferment vanished: however, upon the death of Dr. Hales, he was taken into the service of the Princess Dowager of Wales, and succeeded him as her privy chaplain. When pretty far advanced in life, he married the Lady Elizabeth Lee, daughter of the late Earl of Lichfield. This lady was a widow, and had an amiable son and daughter, who both died young. What he felt for their loss, as well as for that of his wife, is finely expressed in his *Night Thoughts*, in which the young lady is characterised under the name of Narcissa; her brother by that of Philander. He wrote three tragedies, *The Revenge*, *Buissini*, and *The Brothers*. His satires, called *Love of Fame the universal Passion*, are by many esteemed his principal performance; though Swift said the poet should have been either more angry or more merry: they have been characterised as a firing of epigrams written on one subject, that tire the reader before he gets through them. His *Complaint*, or *Night Thoughts*, exhibit him as a moral and melancholy poet, and are esteemed his master-piece. They form a species of poetry peculiarly his own, and in which he has been unrivalled by all those who attempted to write in this manner. They were written under the recent pressure of his sorrow for the loss of his wife, daughter, and son-in-law; they are addressed to Lorenzo, a man of pleasure and the world, and who, as it is insinuated by some, is his own son, but then labouring under his father's displeasure. As a prose-writer, he attained the prevailing manners of his time, in a work called *The Centaur not Fabulous*; and when he was above 80 years of age, published *Conjectures on Original Composition*. He published some other pieces; and the whole of his works are collected in 4 and 5 vols. 12mo. Dr. Young's turn of mind was naturally solemn; yet, notwithstanding this gloominess of temper, he was fond of innocent sports and amusement. He instituted an assembly and a bowling-green in the parish of which he was rector, and often promoted the gaiety of the company in person. His wit was generally poignant, and ever levelled at those who testified any contempt for decency and religion. One Sunday preaching in office at St. James's, he found, that though he strove to make his audience attentive, he could not prevail. Upon which his pity for their folly got the better of all decorum, and he sat back in the pulpit and burst into a flood of tears. Towards the latter part of life he knew his own infirmities, and suffered himself to be in pupillage to his house-keeper; for he considered that, at a certain time of life, the second childhood of age demanded its wonted protection. His son, whose boyish follies were long obnoxious to paternal severity, was at last forgiven in his

will; and our poet died regretted by all, having performed all that man could do to fill his post with dignity. His death happened in 1765.

YPRES, a handsome, large, and populous town of the Austrian Netherlands, with a bishop's see. It has a considerable manufactory in cloth and ferges, and every year in Lent there is a considerable fair. It is one of the barrier towns, but was besieged and taken by the French in 1744. It is seated on a fertile plain on the river Ypre, in E. Long. 2. 48. N. Lat. 50. 51.

YUCCA, ADAM'S NEEDLE, in botany: a genus of plants of the class *hexandria* and order *monogynia*. The corolla is campanulate and patent, there is no style, the capsule is trilocular. There are four species, none of which are natives of Britain.

All of them are exceedingly curious in their growth, and are therefore much cultivated in gardens. The Indians make a kind of bread from the roots of this plant.

YULE, YOOL, or Iul. See *Iul*.

YUNX, in zoology, a genus of birds of the order *Pica*. The bill is short, roundish, and pointed; the nostrils concave and naked: the tongue very long and cylindrical; there are two fore and two hind claws. There is only one species, the *torquilla*, wry-neck, which is a native of Europe, Asia, and Africa, and is often seen in Britain. It is ash-coloured above, with light black and brown streaks. Beneath light brown, with black spots. Tail ash-colour, with four black bars. Weight 1½ oz. Irides hazel. Length 7 inches. Migrates.

Z.

Z A A

Z, or z, the 24th and last letter, and the 19th consonant of our alphabet; the found of which is formed by a motion of the tongue from the palate downwards and upwards to it again, with a shutting and opening of the teeth at the same time. This letter has been reputed a double consonant, having the found *dz*; but some think with very little reason: and, as if we thought otherwise, we often double it, as in *puzzle*, *muzzle*, &c. Among the ancients, Z was a numeral letter, signifying 2000; and with a dash added a-top, Z signified 2000 times 2000, or 4,000,000. In abbreviations this letter formerly stood as a mark for several forts of weights; sometimes it signified an ounce and a half; and very frequently it stood for half an ounce; sometimes for the eighth part of an ounce, or a dram troy weight; and it has in earlier times been used to express the third part of an ounce or eight scruples. ZZ were used by some of the ancient physicians to express myrrh, and at present they are often used to signify zinziber or ginger.

ZAARA, ZAPARA, SAHARA, or the Desert, a vast country of Africa, bounded on the north by Barbary, on the east by Fezzan and Calina, on the south by Tombuctoo, and on the west by the Atlantic Ocean. Zaara contains a variety of wandering nations, all proceeding from Arabs, Moors, and fugitive Portuguese, who took refuge there when the family of the Sherifs made themselves masters of the three kingdoms of Barbary. All these people bear indiscriminately the names of *Nars*, *Moors*, or *Arabs*. They are subdivided into various nations, of which the most considerable are the Mongearts, Trafsars, and Braenars. The Mongearts lead a wandering life, and live chiefly on the milk of their flocks, with a little barley meal, and some dates. The poorer sort go naked, except the females, who commonly wrap a clout about their middle, and wear a kind of bonnet on their head; but the wealthier sort have a kind of loose gown, made of blue calicoe, with large sleeves, that is brought them from Negroland. When they move from one place to another for fresh pasture, water, or prey, most of them ride on camels, which have generally a sort of saddle between the bunch and the neck, with a string or strap run through their nostrils, which serves for a bridle; and instead of spurs they use a sharp bodkin. Their tents or huts are covered with a coarse fluff, made of camel's hair, and a kind of wool or moss that grows on the palm trees. These Arabs live here under the government of their sheiks or cheyks; as in Arabia, Egypt, and other places.

Z A F

The other two tribes are rather more civilised. They are all Mahometans.

ZABULON (anc. geog.), one of the twelve tribes: bounded on the north by the tribes of Asher and Napthali; on the east by the sea of Galilee; on the south by the tribe of Issachar or the brook Cifon, which ran between both; on the west by the Mediterranean; so that it touched two seas, or was bimarous.

ZABULON (anc. geog.), a very strong town in the tribe of that name, on the Mediterranean, furnished of men, near Ptolemais: its vicinity to which makes it probable that it was also Chabulon, unless either name is a faulty reading in Josephus: distant about 60 stadia from Ptolemais.

ZACYNTHUS (anc. geog.), an island to the south of Cephalenia 60 stadia, but nearer to Peloponnesus, in the Ionian Sea, formerly subject to Ulysses, in compass above 160 stadia, woody and fruitful, with a considerable cognominal town and a port. The island lies over against Elis, having a colony of Achæans from Peloponnesus, over against the Corinthian Gulf. Both island and town are now called *Zante*.

ZAFFRE, is the oxyd of cobalt, employed for painting pottery ware and porcelain of a blue colour. The method of preparing it is as follows: The cobalt taken out of the mine is broken with hammers into pieces about the size of an hen's egg: and the stony involucrum, with such other heterogeneous matters as are distinguishable by the eye, are separated as much as possible. The chosen mineral is then pounded in stamping mills, and sifted through brass wire sieves. The lighter parts are washed off by water, and it is afterwards put into a large flat-bottomed arched furnace, resembling a baking oven, where the flame of the wood reverberates upon the ore; which is occasionally stirred and turned with long-handled iron hooks or rakes; and the process is continued till it ceases to emit any fumes. The oven or furnace is terminated by a long horizontal gallery, which serves for a chimney; in which the arsenic, naturally mixed with the ore, sublimes. If the ore contains a little bismuth, as this semimetal is very fusible, it is collected at the bottom of the furnace. The cobalt remains in the state of a dark grey oxyd, and is called *zaffre*. One hundred pounds of the cobalt ore lose 20 and even 30 per cent. during this operation, which is continued 4 or even 9 hours, according to the quality of the ore. The roasted ore being taken out from the furnace, such

parts as are concreted into lumps are pounded and sifted afresh. Zaffre, in commerce, is never pure, being mixed with two or rather three parts of powdered flints. A proper quantity of the best sort of these, after being ignited in a furnace, are thrown into water to render them friable, and more easily reduced to powder; which, being sifted, is mixed with the zaffre, according to the before-mentioned dose; and the mixture is put into casks, after being moistened with water. This oxyd, fused with three parts of sand, and one of pot-ash, forms a blue glass; which, when pounded, sifted, and afterwards ground in mills, included in large casks, forms *finest*.

The blue of zaffre is the most solid and fixed of all the colours that can be employed in vitrification. It suffers no change from the most violent fire. It is successfully employed to give shades of blue to enamels, and to the crystal glasses made in imitation of some opaque and transparent precious stones, as the lapis lazuli, the turquois, the sapphire, and others of this kind.

ZALEUCUS, a famous legislator of the Locrians, and the disciple of Pythagoras, flourished 500 years B.C. He made a law, by which he punished adulterers with the loss of both their eyes; and his son offending was not absolved from this punishment: yet, to show the father as well as the just law-giver, he put out his own right, and his son's left eye. This example of justice and severity made so strong an impression on the minds of his subjects, that no instance was found of the commission of that vice during the reign of that legislator. It is added, that Zaleucus forbade any wine being given to the sick on pain of death, unless it was prescribed by the physicians; and that he was so jealous of his laws, that he ordered, that whoever was desirous of changing them, should be obliged, when he made the proposal, to have a cord about his neck, in order that he might be immediately strangled, if those alterations were esteemed no better than the laws already established. Diodorus Siculus attributes the same thing to Charondas, legislator of the Sybarites.

ZAMA (ana. geog.), a town of Chamane, a district of Cappadocia, of unknown situation.—Another Zama, of Mesopotamia, on the Sacoras, to the south of Nisibis.—A third, of Numidia, distant five days' journey to the west of Carthage: it was the other royal residence of the kings of Numidia, hence called *Zama Regia*. It stood in a plain; was stronger by art than nature; richly supplied with every necessary; and abounding in men, and every weapon both of defence and annoyance. The last of these is remarkable for the decisive battle fought between the two greatest commanders in the world, Hannibal the Carthaginian, and Scipio Africanus. Of this engagement, the most important perhaps that ever was fought, Mr. Hooke gives an interesting account.

ZANGUEBAR, a country in Africa, lying on the eastern coast, between three degrees of north latitude, and eighteen south. It includes several petty kingdoms, in which the Portuguese have various settlements. The inhabitants, except those converted by the Portuguese, are all Mahometans or idolaters; and the latter much the more numerous. The names of the principal territories are *Mombaza*, *Lamon*, *Meinda*, *Quiola*, and *Mosambique*. The Portuguese have built several forts in Mombaza and Mosambique, and have settled several colonies there. They trade with the negroes for slaves, ivory, gold, ostrich-leathers, wax, and drugs. The productions are much the same as in other parts of Africa between the tropics.

ZANONIA, in botany: the name of a genus of plants of the order *diœcia*, class *pentandria*. The characters are these: it produces separate male and female flowers; in the male flower the cup is a perianthium, composed of three leaves of

an oval figure, expanding every way, and shorter than the flower; the flower is monopetalous, but divided into five segments, and has an open mouth; the segments are jagged, and are equal in size, and bend backwards; the stamina are five filaments of the length of the cup, standing open at their ends, and terminated by simple apices; the female flowers grow on separate plants, and have the cup and flower the same as in the male, only that the cup stands upon the germ of the pistil; this germ is oblong, and from it are propagated three reflex conic styles; the stigmata are bifid and curled; the fruit is a long and very large berry, truncated at the end, and very small at the base; it contains three cells, and has a curled future near the apex; the seeds are two; they are of an oblong figure, and flat. There is one species, the *indica*.

ZANTE, an island of the Mediterranean, near the coast of the Morea, 19 miles south-east of the island of Cephalonia, belonging to the Venetians. It is about 24 miles in length, and 12 in breadth, and very pleasant and fertile; but its principal riches consist in currants, with which it greatly abounds. They are cultivated in a very large plain, under the shelter of mountains on the shore of this island; for which reason the sun has greater power to bring them to perfect maturity. The town called *Zante* may contain near 20,000 inhabitants; the whole island contains about 40,000. The houses are low, on account of the frequent earthquakes, for scarce a year passes without one; however, they do no great damage. The natives speak both Greek and Italian. There are very few Roman-catholics among them; but they have a bishop as well as the Greeks. This place has no fortifications, but there is a fortress upon an eminence planted with cannon. In one part of this island is a place which shakes when trod upon like a quagmire; and a spring which throws out a great deal of bitumen, especially at the time of an earthquake. It serves instead of pitch to pay the bottoms of the ships, and about 100 barrels in a year are used for this purpose. There are about 50 villages in the island; but no other large town beside Zante. It is seated on the eastern side of the island, and has a good harbour. The English and Dutch have each a factory, and consul here. E. Long. 21. 3. N. Lat. 37. 53.

ZANTHOXYLUM, the TOOTHACH-TREE, in botany; a genus of plants of the class of *diœcia*, and order of *pentandria*; and in the natural system arranged under the 46th order, *Hederaceæ*. The calyx is quinquepartite; there is no corolla; the female flower has five pistils and as many monospermous capsules. There are two species, the *clava herculis*, and the *trifoliatum*; neither of which are natives of Britain.

ZAPATA, a kind of feast or ceremony held in Italy, in the courts of certain princes, on St. Nicholas's day; wherein people hide presents in the shoes or slippers of those they would do honour to, in such a manner as may surprize them on the morrow when they come to dress; being done in imitation of the practice of St. Nicholas, who used in the night-time to throw purses of money in at the windows to marry poor maids withal.

ZEA, INDIAN CORN, in botany: a genus of plants of the class *monœcia*, order *triandria*. The male-flowers are placed on distinct spikes; the calyx is a biflorous, beardless glume; the corolla a beardless glume; the female calyx is a bivalve glume, as is the corolla. There is one filiform, pendulous style; the seeds are solitary and buried in an oblong receptacle. There is only one species, the *Mays*, maize. The Indians in New England, and many other parts of America, had no other vegetable but maize or Indian corn for making their bread. They call it *weachin*; and in the United States of America there is much of the bread of the country made of

this grain, not of the European corn. In Italy and Germany also there is a species of maize, which is the food of the poor inhabitants.

The ear of the maize yields a much greater quantity of grain than any of our corn ears. There are commonly about eight rows of grain in the ear, often more, if the ground be good. Each of these rows contains at least 30 grains, and each of these gives much more flour than a grain of any of our corn. The grains are usually either white or yellowish; but sometimes they are red, bluish, greenish, or olive-coloured, and sometimes striped and variegated. This sort of grain, though so essentially necessary to the natives of the place, is yet liable to many accidents. It does not ripen till the end of September; so that the rains often fall heavy upon it while on the stalk, and the birds in general peck it when it is soft and unripe. Nature has, to defend it from these accidents, covered it with a thick husk, which keeps off slight rains very well; but the birds, if not frightened away, often eat through it, and devour a great quantity of the grain.

There are three or four varieties of maize in different parts of America. That of Virginia is very tall and robust, growing to seven or eight feet high; that of New England is shorter and lower. And the Indians farther up in the country have a yet smaller kind in common use. The stalk of the maize is joined like the sugar-cane; it is very soft and juicy, and the juice is so sweet and saccharine, that a syrup, as sweet as that of sugar, has been often made of it; and things sweetened with it have been found not distinguishable from those done with sugar. It has not been tried yet whether it will crystallize into sugar; but in all probability it will.

The Americans plant this corn any time from the beginning of March to the beginning of June; but the best season is the middle of April. The savage Indians, who knew nothing of our account of months, used to guide themselves in the seed-time of this useful plant by the budding of some particular trees of that country, and by the coming up of a sort of fish into their rivers, which they call the *aloofse*. These things were both so regular, that they were in no danger of mistaking the time.

The manner of planting maize is in rows, at equal distances, every way about five or six feet. They open the earth with a hoe, taking away the surface to three or four inches deep, and of the breadth of the hoe; they then throw in a little of the finer earth, so as to leave the hoe four inches deep or thereabouts, and in each of these holes they place four or five grains at a little distance from one another. If two or three of these grow up, it is very well; some of them are usually destroyed either by the birds or other animals.

When the young plants appear, they hoe up the weeds from time to time; and when the stalk gathers some strength, they raise the earth a little about it, and continue this at every hoeing till it begins to put forth the ears; then they enlarge the hill of earth, round the root, to the size of a hop-hill, and after this they leave it till the time of harvest, without any farther care. When they gather the ears, they either immediately strip off the corn, or else hang up the ears, tied in traces at distances from one another; for if they are laid near together, they will heat and rot, or else sprout and grow. But kept cool and separate, they will remain good all the winter. The best method is to thresh out the corn as soon as the harvest is over, to dry it well, on mats in the sun, and then lay it up in holes of the ground, well lined with mats, grass, or the like, and afterwards covered at top with more earth. The most careful among the Indians use this method, and this sort of subterranean granary always proves good.

The uses of this plant among the Indians are very many. The great article is the making their bread of it; but besides

this, the stalks, when cut up before they are too much dried, are an excellent winter food for cattle; but they usually leave them on the ground for the cattle to feed on. The husks about the ear are usually separated from the rest, and make a particular sort of fodder, not inferior to our hay. The Indian women have a way of flitting them into narrow parts, and they then weave them artificially into baskets and many other toys. The original way of eating the grain among the Indians was this: they boiled it whole in water till it swelled and became tender, and then they fed on it either alone or eat it with their fish and venison instead of bread. After this, they found the way of boiling it into a sort of pudding, after bruising it in a mortar; but the way of reducing it to flour is the best of all. They do this by parching it carefully in the fire, without burning, and then beating it in mortars and sifting it. This flour they lay up in bags as their constant provision, and take it out with them when they go to war, eating it either dry or with water. The English have contrived, by mixing it into a stiff paste, either by itself or with rye or wheat-meal, fermenting it with leaven or yeast, and baking it in a hot oven, to make good bread of it. They have likewise found out a method of making good beer, either of the bread, or by malting the grain.

ZEAL, passionate ardour for any person or cause. It is most frequently used to denote a strong and warm attachment to the distinguishing doctrines or worship of some particular sect of Christians. Thus we say, a *zealous Calvinist*, *Arminian*, or *Papist*; though we may likewise with the greatest propriety say of an upright and benevolent man, that he is *zealous of good works*.

ZEALAND, the chief of the Danish islands, is situated at the entrance of the Baltic Sea, bounded by the Schaggorrae Sea on the north, by the Sound, which separates it from Schonen, on the east, by the Baltic Sea on the south, and by the strait called the *Great Belt*, which separates it from the island of Funen, on the west, being of a round figure, near 200 miles in circumference: the chief town is Copenhagen.

ZEALAND, is also a province of the United Netherlands, consisting of eight islands, which lie in the mouth of the river Scheld, bounded by the province of Holland, from which they are separated by a narrow channel on the north, by Brabant on the east, by Flanders, from which they are separated by one of the branches of the Scheld, on the south, and by the German Ocean on the west.

NEW ZEALAND, a country of Asia, in the South Pacific Ocean, first discovered by Tasman, the Dutch navigator, in the year 1642, who gave it the name of *Staten Land*, though it has been generally distinguished in our maps and charts by the name of *New Zealand*, and was supposed to be part of a southern continent: but it is now known, from the late discoveries of Captain Cook who sailed round it, to consist of two large islands, divided from each other by a strait four or five leagues broad. They are situated between the latitudes of 34 and 48 degrees south, and between the longitudes of 166 and 180 degrees east from Greenwich. One of these islands is for the most part mountainous, rather barren, and but thinly inhabited; but the other is much more fertile, and of a better appearance. In the opinion of Sir Joseph Banks and Dr. Solander, every kind of European fruits, grain, and plants, would flourish here in the utmost luxuriance. From the vegetables found here, it is supposed that the winters are milder than those in England, and the summers not hotter, though more equally warm; so that it is imagined, that if this country were settled by people from Europe, they would, with moderate industry, be soon supplied, not only with the necessaries, but the luxuries of life, in great abundance. Here are forests of vast extent, filled with very large timber trees;

and near 400 plants were found here that had not been described by the naturalists. The inhabitants of New Zealand are stout and robust, and equal in stature to the largest Europeans. Their colour in general is brown, but in few deeper than that of the Spaniard who has been exposed to the sun, and in many not so deep; and both sexes have good features. Their dress is very uncouth, and they mark their bodies in a manner similar to the inhabitants of Otaheite, and which is called *tattooing*. Their principal weapons are lances, darts, and a kind of battle-axes; and they have generally shown themselves very hostile to the Europeans who have visited them.

ZEALOTS, an ancient sect of the Jews, so called from their pretended zeal for God's law and the honour of religion.

ZEBRA, in zoology. See **EQUUS**.

ZEBU, in zoology; a name given by M. de Buffon to the 'bos indicus' of Linnæus. See **BOS**, vi.

ZECHIN, or **ZECHINO**. See **SEQUIN**.

ZEDOARY, in the materia medica. See **KÆMPFERIA**.

ZELL, a city of Germany in the circle of Lower Saxony, capital of the duchies of Zell and Lunenburg, situated at the confluence of the rivers Aller and Fuhle, 30 miles north of Hanover, and 40 south of Lunenburg. E. Long. 10. 12. N. Lat. 52. 49.

ZEMBLA NOVA, a very large island, lying in the Northern Ocean, to the north of Russia, from which it is separated by the strait of Waigata. It has no inhabitants except wild beasts, particularly white foxes and bears. In 1595 a Dutch vessel was cast away on the coast, and the ship's company were obliged to winter here; but they did not feel the fun from the fourth of November to the beginning of February, and had great difficulty to keep themselves from being frozen to death.

ZEMINDAR. See **HINDOOSTAN**.

ZEND, or **ZENDAVESTA**, a book ascribed to Zoroaster, and containing his pretended revelations; which the ancient Magicians and modern Perfes, called also *Gaurs*, observe and reverence in the same manner as the Christians do the Bible, and the Mahometans the Koran, making it the sole rule both of their faith and manners. The word, it is said, originally signifies any instrument for kindling fire, and is applied to this book to denote its aptitude for kindling the flame of religion in the hearts of those who read it.

The Zend contains a reformed system of Magianism; teaching that there is a Supreme Being, eternal, self-existent, and independent, who created both light and darkness, out of which he made all other things; that these are in a state of conflict, which will continue till the end of the world; that then there shall be a general resurrection and judgment; and that just retributions shall be rendered unto men according to their works; that the angel of darkness with his followers shall be confined to a place of everlasting darkness and punishment, and the angel of light with his disciples introduced into a state of everlasting light and happiness; after which light and darkness shall no more interfere with each other. The Zend also enjoins the constant maintenance of sacred fires and fire-temples for religious worship; the distinction of clean and unclean beasts; the payment of tithes to priests, which are to be of one family or tribe; a multitude of washings and purifications, resembling those of the Jewish law; and a variety of rules and exhortations for the exercise of benevolence and charity. In this book there are many passages evidently taken out of the Scriptures of the Old Testament, particularly out of the Psalms of David. Moreover, Dr. Baumgarten asserts, that this work contains doctrines, opinions, and facts, actually borrowed from the Jews, Christians, and Mahometans; whence, and from other circumstances, he concludes that both the history and writings of this prophet were probably invented in the later ages, when the fire-worshippers

under the Mahometan government thought fit to vindicate their religion from the suspicion of idolatry.

At whatever period the Zend may have been written, we are assured by Dr. Hyde that it is in the pure old Persian language, and in the character called *Peplavi*. Some parts of it contain the original text, and others Zoroaster's second thoughts subjoined, for explaining more fully his doctrine. These were occasioned by the opposition of adversaries, and unforeseen circumstances which occurred during the fabrication of the imposture. About 300 years ago, when the old Persian language had become antiquated and little understood, one of the deffours or high-priests among the Perfes composed the *Sadda*, which is a compendium in the vulgar or modern Persian tongue, of those parts of the Zend that relate to religion, or a kind of code of canons and precepts, drawn from the theological writings of Zoroaster, serving as an authoritative rule of faith and practice for his followers. This *Sadda* is written in a low kind of Persian verse, and, as Dr. Hyde informs us, it is *bonorum & malorum faragdo*, having many good and pious things, and others very superstitious and trifling. See **PERSES** and **ZOROASTER**.

ZENITH, in astronomy, the vertical point, or a point in the heavens directly over our heads. See **ASTRONOMY**.

ZENO, **ELEATES**, an eminent Grecian philosopher, was born at Elea about 504 years before Christ. He was a zealous friend of civil liberty, and is celebrated for his courageous and successful opposition to tyrants; but the inconsistency of the stories related by different writers concerning him in a great measure destroys their credit. He chose to reside in his small native city of Elea rather than at Athens, because it afforded freer scope to his independent and generous spirit, which could not easily submit to the restraints of authority. It is related, that he vindicated the warmth with which he resented reproach, by saying, "If I were indifferent to censure, I should also be indifferent to praise." The invention of the dialectic art has been improperly ascribed to Zeno; but there can be no doubt that this philosopher, and other metaphysical disputants in the Eleatic sect, employed much ingenuity and subtlety in exhibiting examples of most of the logical arts, which were afterwards reduced to rule by Aristotle and others. If Seneca's account of this philosopher deserves credit, he reached the highest point of scepticism, and denied the real existence of external objects.

ZENO, the founder of the sect of the Stoics, was born about 300 years before Christ, at Citium in the island of Cyprus. This place having been originally peopled by a colony of Phœnicians, Zeno is sometimes called a Phœnician. His father was by profession a merchant, but discovering in the youth a strong propensity towards learning, he early devoted him to philosophy. In his mercantile capacity he had frequent occasion to visit Athens, where he purchased for his son several of the writings of the most eminent Socratic philosophers. These he read with great avidity; and when he was about 30 years of age, he determined to take a voyage to a city which was so celebrated both as a mart of trade and of science. If it be true, as some writers relate, that he brought with him a valuable cargo of Phœnician purple, which was lost by shipwreck upon the coast of Piræus, this circumstance will account for the facility with which he at first attached himself to a sect whose leading principle was the contempt of riches. Upon his first arrival in Athens, going accidentally into the shop of a bookseller, he took up a volume of the Commentaries of Xenophon; and after reading a few passages, was so much delighted with the work, and formed so high an idea of the author, that he asked the bookseller where he might meet with such men. Crates the Cynic philosopher happening at that instant to be passing by, the bookseller pointed to him, and

said, "Follow that man." Zeno attended upon the instructions of Crates, and admired the general principles of the Cynic school, though he could not easily reconcile himself to their peculiar manners. Besides, his inquisitive turn of mind would not allow him to adopt that indifference to every scientific enquiry which was one of the characteristic distinctions of the sect. He therefore attended the lectures of Stilpo several years, and passed over to other schools, particularly to those of Xenocrates and Diodorus Cronus. By the latter he was instructed in dialectics. He was so much delighted with this branch of study, that he presented to his master a large pecuniary gratuity, in return for his free communication of some of his ingenious subtleties. After attending almost every other master, he became a disciple of Polemo, and having at length collected materials from various quarters for a new system of his own, Zeno determined to become the founder of a new sect. The place which he made choice of for his school was a public portico, adorned with the pictures of Polygnotus, and other eminent painters. It was the most famous portico in Athens, and called, by way of eminence, *Stoa*, "the Porch." It was from this circumstance that the followers of Zeno were called *Stoics*.

In his person Zeno was tall and slender; his aspect was feverish, and his brow contracted. His constitution was feeble, but he preserved his health by great abstemiousness, and lived to the extreme age of 98; but at last, in consequence of an accident, he voluntarily put an end to his life. As he was walking out of his school he fell down, and in the fall broke one of his fingers; upon which he was so affected with a consciousness of infirmity, that, striking the earth, he said, "Why am I thus importuned? I obey thy summons;" and immediately went home and strangled himself. He died in the first year of the 129th Olympiad. The Athenians, at the request of Antigonus, erected a monument to his memory in the Ceramicus.—We ought not to confound the two Zenos already mentioned with

ZENO, a celebrated Epicurean philosopher, born at Sidon, who had Cicero and Pomponius Atticus for his disciples, and who wrote a book against the mathematics, which, as well as that of Pseudothodorus's refutation of it, is lost; nor with several other Zenos mentioned in history.

ZEOLITE. See CLAY and MINERALOGY.

ZEPHYR, the WEST-Wind, or that which blows from the cardinal point of the horizon opposite to the east.

ZEPHYRUS, one of the Pagan deities, was represented as the son of Aurora, and the lover of the nymph Chloris, according to the Greeks, or of Flora according to the Romans; and as presiding over the growth of fruits and flowers. He is described as giving a refreshing coolness to the air by his soft and agreeable breath, and as moderating the heat of summer by fanning the air with his silken wings. He is depicted under the form of a youth, with a very tender air, with wings resembling those of the butterfly, and with his head crowned with a variety of flowers. As the poets of Greece and Rome lived in a warm climate, they are lavish in their praise of this beneficent deity, and under his name describe the pleasure and advantage they received from the western breezes.

ZERDA. See CANIS, Sp. xiv.

ZERTA, the ZERTE, a fish caught in the rivers of Italy and some other places, of the figure of the chub, and called by authors *capito anadromus*, and the *blike*. It seldom grows to more than two pounds weight, and at times lives in rivers, at times in the sea; and is esteemed a very well tasted fish, especially a little before the season of its spawning. The zerte is that species of cyprinid described by Gesner and others under the name of *capito anadromus*.

ZEST, the woody thick skin quartering the kernel of a wal-

nut; prescribed by some physicians, when dried and taken with white-wine, as a remedy against the gravel. *Zest* is also used for a chip of orange or lemon peel; such as is usually squeezed into ale, wine, &c. to give it a flavour; or the fine oil which spouts out of that peel on squeezing it.

ZEUGMA, a figure in grammar, whereby an adjective or verb which agrees with a nearer word, is also, by way of supplement, referred to another more remote.

ZEUS, in ichthyology, a genus of fishes of the order of *thoracici*. The head is compressed, and declines, the upper lip being vaulted over by a transverse membrane; the tongue is fubulated; there are seven rays in the gill membrane; and the body is compressed.—The species are eight; of which the most remarkable is the *faber* or *doree*. It is of a hideous form, its body is oval, and greatly compressed on the sides; the head large; the snout vastly projecting; the mouth very wide; the teeth very small; the eyes great, the irides yellow; the lateral line oddly distorted, sinking at each end, and rising near the back in the middle; beneath it on each side is a round black spot. The tail is round at the end, and consists of fifteen yellow rays. The colour of the sides is olive, varied with light blue and white, and while living is very repeludent, and as if gilt; for which reason it is called the *doree*. The largest fish we have heard of weighed twelve pounds.

Superstition hath made the *doree* rival to the hadlock, for the honour of having been the fish out of whose mouth St. Peter took the tribute-money, leaving on its sides those incontestible proofs of the identity of the fish, the marks of his finger and thumb. Mr. Quin added this delicious fish to our table, and overcame the vulgar prejudices that prevailed on account of its deformity. This fish was supposed to be found only in the southern seas of this kingdom, but it has been discovered likewise on the coast of Anglesey. Those of the greatest size are taken in the Bay of Biscay, off the French coasts; they are also very common in the Mediterranean: Ovid must therefore have styled it *rarus faber*, on account of its excellency, not its scarcity.

ZEUXIS, a celebrated painter of antiquity, flourished about 400 years before Christ. He was born at Heraclea; but as there have been many cities of that name, it cannot be certainly determined which of them had the honour of his birth. Some learned men, however, conjecture, that it was the Heraclea near Crotona in Italy. He carried painting to a much higher degree of perfection than Apollodorus had left it; discovered the art of properly disposing of lights and shades, and particularly excelled in colouring. He amassed immense riches; and then resolved to sell no more of his pictures, but gave them away; saying very frankly, "That he could not set a price on them equal to their value." One of this painter's finest pieces was a Hercules strangling some serpents in his eradle, in the presence of his affrighted mother: but he himself chiefly esteemed his *Athleia*, or *Champion*, under which he placed a Greek verse that afterwards became very famous, and in which he says, "That it was easier to criticize than to imitate the picture." He made a present of his *Alemena* to the *Aggrigentines*. Zeuxis did not value himself on speedily finishing his pictures; but knowing that Agatharchus gloried in his being able to paint with ease, and in a little time, he said, "That for his part he, on the contrary, gloried in his slowness; and if he was long in painting, it was because he painted for eternity." Verrius Flaccus says, that Zeuxis, having painted an old woman, he laughed so very heartily at the sight of this picture, that he died: but as no other of the ancients have mentioned this particular, there is the greatest reason to believe it fabulous. Carlo Dati has composed in Italian the Life of Zeuxis, with those of Parrhasius, Apelles, and Protogenes. This work was printed at Florence in 1667.

ZICLAG, or **ZIKLAG** (anc. geog.), a town of the tribe of Simeon, on the borders of the Philistines (Joshua xv. and xix.), but in the hands of the Philistines till David's time (1 Sam. xxvii. and xxx).

ZIMB, in natural history, a pestilential fly described by Mr. Bruce in his account of Abyssinia. It is somewhat larger than a bee, thicker in proportion, and having broader wings, placed separate like those of a fly, and quite colourless. So alarmed are the cattle by these insects, that when they hear their buzzing, they forsake their pasture, and run about till they fall down with terror, fatigue, and hunger. It was to avoid this nuisance, as Mr. Bruce relates, that the city of Meroe was built in the low country, rather than in a more advantageous situation among the mountains.

ZIMENT-WATER, **COPPER-WATER**, in natural history, the name by which some have called water found in places where there are copper-mines, and lightly impregnated with particles of that metal. The most famous spring of this kind is about a mile distant from Newfol in Hungary, in the great copper-mine called by the Germans *herra grundt*. The water in this mine is found at different depths, and is received into basins, for the purpose of separating the copper from it: in some of these it is much more saturated with this metal than in others, and will make the supposed change of iron into that metal much sooner. The most common pieces of iron used in the experiments are horse-shoes, nails, and the like; and they are found very little altered in shape, after the operation, except that their surfaces are more raised. The water appears greenish in the basin, where it stands; but if a glass of it be taken up, it looks clear as crystal: it has no smell, but a strong vitriolic astringent taste, inasmuch that the lips and tongue are blistered and scorched upon tasting it.

ZIN (anc. geog.), a wilderness encompassing Idumæa, at least on the south and west, as far as Palestine or Canaan; but according to Wells, on the east of Edom, to the north of Ezion-gaber.

ZINC, a femimetal. For a description of the ores of this metal, the method of extracting it from these ores, and for its properties, see **CALAMINE**; **CHEMISTRY**; **MINERALOGY**; **METALLURGY**. Zinc, besides its medical qualities, is of great use in the arts: united with copper in different proportions, it forms brass and pinchbeck; and united with tin, it forms a kind of pewter. Brass is formed by mixing two parts of copper with one of zinc; pinchbeck by mixing three or four parts of copper to one of zinc: when the metals are mixed in equal quantities they form a very exact imitation of gold. Its inflammable property renders zinc a useful ingredient in fireworks.

It has been proposed to substitute this femimetal instead of tin in the lining of copper vessels; the latter being thought insufficient to prevent the dangerous effects of the copper. Mr. Malouin, who has made many experiments on the lining of vessels in this manner, asserts that it spreads more evenly on the copper than tin itself; that it is much harder and less fusible, and consequently more durable than tin. Mr. Macquer owns these advantages; but thinks it dangerous to be used in culinary vessels, as it is soluble in vegetable acids, and the combination of it with the vitriolic acid is known to be a strong emetic. Gaubius also mentions a celebrated remedy for convulsive disorders, named *luna fixata ludamvio* which Macquer affirms to be strongly emetic in very small doses. "But, may it not be presumed (says Fournoy), that properties which are applicable only to the vitriol and flower zinc, cannot be applied to the femimetal itself, nor even, without farther experiments, to the salts formed by its combination with the vegetable acids." Mr. de la Plandie took the salts of zinc, formed by its combination with vegetable acids, in a much

stronger dose than the aliments prepared in copper covered with zinc can possibly contain them, and found no dangerous effects to follow. The flowers of zinc have been used as an antispasmodic, and are an article of our present materia medica; but it does not clearly appear what success may be expected from them.

ZINNIA, in botany: a genus of plants of the class *syngenesia*, order *polygamia superflua*; and in the natural system arranged under the 49th order, *Compositæ*. The receptacle is paleaceous, the pappus consists of two erect awns, the calyx is ovato-cylindrical and umbicated; the rays consist of five persisting entire florets. There are two species, the *pauciflora* and *multiflora*, neither of which is a native of Britain.

ZINZENDORFF (Nicholas Lewis), count, was the noted founder of the German religious sect called *Moravians*, or *Herrnhuters*, or, as they pretend, the restorer of that society. From his own narrative it appears, that when he came of age in 1721, his thoughts were wholly bent on gathering together a little society of believers, among whom he might live, and who should entirely employ themselves in exercises of devotion under him. He accordingly purchased an estate at Bertholdsdorf in Upper Lusatia, where being joined by some followers, he gave the curacy of the village to a man of his own complexion; and Bertholdsdorf soon became talked of for a new mode of piety. One Christian David, a carpenter, brought a few proselytes from Moravia: they began a new town about half a league from the village, where Count Zinzendorf fixed his residence among them, and where great numbers of Moravians flocked and established themselves under his protection: so that in 1732 their number amounted to 600. An adjacent hill, called the *Hühberg*, gave occasion to these colonists to call their new settlement *Huth des Herrn*, and afterward *Herrnhuth*; which may be interpreted "The guard or protection of the Lord;" and from this the whole sect have taken their name. The count spared neither pains nor art to propagate his opinions; he went himself all over Europe, and at least twice to America; and sent his missionaries throughout the world. Count Zinzendorf died in 1760. Those who wish to know more of the Moravian tenets may consult Rimius's account of them, translated in 1753. See **UNITED BRETHREN**.

ZISCA (John), a famous general of the forces of the Hussites, in the 15th century, was a gentleman educated at the court of Bohemia, in the reign of Wenceslaus. He entered very young into the army, and after distinguishing himself on several occasions, lost an eye in a battle, whence he was called *Zisca*, or *One-eyed*. At length the Reformation, begun by John Huss, spreading through almost all Bohemia, Zisca placed himself at the head of the Hussites, and had soon under his command a body of 40,000 men. With this army he gained several victories over those of the Romish religion, who carried on a kind of crusade against them, and built a town in an advantageous situation, to which he gave the name of *Tabor*; whence the Hussites were afterwards called *Taborites*. Zisca lost his other eye by an arrow at the siege of the city of Rabi; but this did not prevent his continuing the war, his fighting battles, and gaining several great victories, among which was that of Augsp on the Elbe, in which 9000 of the enemy were left dead on the field. The Emperor Sigismund, alarmed at his progress, caused very advantageous proposals to be offered to him; which he readily accepted, and set out to meet Sigismund, but died on the road. He ordered that his body should be left a prey to the birds and wild beasts; and that a drum should be made of his skin, being persuaded that the enemy would fly as soon as they heard the sound. It is added, that the Hussites executed his will; and that the news of this order made such an impression on the disturbed imagi-

nations of the German Papists, that in many battles they actually fled at the beat of the drum with the utmost precipitation, leaving their baggage and artillery behind them.

ZINZIBER, or **ZINGIBER**, in botany. See **AMOMUM** and **GINGER**.

ZION, or **SION** (anc. geog.), a very famous mountain, standing on the north side of the city of Jerusalem (Psal. xlvii. 2.); containing the upper city, built by King David; and where stood the royal palace (Josephus). A part of Zion, situated at its extremity, was called *Millo*, or, in the city of David (2 Chron. xxxii. 5.) Modern travellers, who have been upon the spot, say, that Zion is the whole of the mountain on which Jerusalem stands at this day, though not to the extent in which it anciently stood on the same mountain, as appears, Psal. ix. 12. 15. lxxv. 1. lxxxvii. 2. 3. Il. lxii. 1. It is swelled into several eminences or tops; as Moriah, Acra Bezetha, and Zion a particular eminence of mount and Zion Proper, &c. encompassed on three sides, east, west, and south, with one continued very deep and steep valley; by means of which it was impregnable on these three sides, and always attacked and taken, according to Josephus, by the enemy on the north side, where mount Zion becomes level, and the vales of Gihon and Jehosaphat gradually lose themselves. This deep and steep valley incontestibly constitutes the compass of the old Jerusalem on those three sides, as plainly appears to any person who has been upon the spot. There is another *Zion*, the same with **HERMON**.

ZIPH, or **SIPH** (anc. geog.), the name of a wilderness or desert in the tribe of Judah, where David was a fugitive; lying to the south-east of Hebron; so called from *Ziph* or *Siph*, a twofold town in this tribe; the one more to the south towards Idumea, on the confines of Eleutheropolis (Jerome); the other eight miles to the east of Hebron, towards the Dead Sea, inclining southwards, became near mount Carmel. Here was a mountain, mentioned 1 Sam. xxiii. 14. in which David abode, said by Jerome to be rugged, dismal, and always overcast. *Ziphim*, *Ziphei*, or *Ziphenites*, the inhabitants of *Ziph*, ver. 10.

ZIRCHNITZER-SEE, otherwise called the *Lake of Csirknitz*, in Carniola, is about one German or four English miles in length, and half as much in breadth, contains three beautiful islands, and is encompassed at some distance with mountains and forests. But what is most remarkable is, that it disappears generally once a-year, about St. John's or St. James's day, running off through holes or pits in the bottom; sometimes it will disappear twice or thrice a-year, and sometimes even in winter, if the weather be dry. On the other hand, it has been known to continue two or three years without running off. Of the holes or pits, there are five much larger than the rest, each of which successively, when the water runs off, stands empty five days; so that the whole lake becomes dry in twenty-five. As soon as the beginning of the ebb is observed, the fishing in the pits begins, which belongs to five seigniories. The fish, which are carp, tench, pike, eels, and two other sorts called *schleien*, and *nuten*, are caught by laying nets over the holes. Mr. Keytler tells us, that upon the ringing of a bell at Zirknitz, when the waters begin to fall, the peasants, both men and women, run to the pools quite naked, notwithstanding both the clergy and magistrates have used their utmost endeavours to suppress so indecent a custom. When the water runs off early in the year, in about three weeks after it is gone there is good grass on the bottom, which is mowed down, and the bottom afterwards ploughed and sowed with millet. If the water runs not off early, nothing can be sown; and if it returns soon, the seed is lost.

With respect to its return, the water at first bursts out of some pits on the fourth side with great violence, a little rain always falling at the same time; but afterwards (when the rain falls heavier, and it thunders at the same time so loud as to shake the earth) it breaks out through all the apertures with great force, inasmuch, that the lake is filled in 18 or 24 hours, at which time it is in a manner covered with wild fowl; such as geese, ducks, &c. After the millet-harvest, all manner of game is hunted, caught, or killed in it. On the fourth side are two caverns, out of which, when it thunders, water issues with astonishing violence; and if it happens in harvest, a great many naked, black, and blind, but fat ducklings, are brought up with the water, which in 14 days receive their sight, and are covered with feathers.

ZIZANIA, in botany: a genus of plants of the class *monœcia*, order, *hexandria*; and in the natural system arranged under the 4th order, *Gramina*. There is no male calyx; the corolla is a bivalved, beardless glume, intermixed with the female flowers; there is no female calyx, the corolla is an univalved, cucullated, and aristated glume; the style is bipartite, and there is one seed covered with the plaited corolla. There are three species; the *aquatica*, the *palustris*, and *terrestris*, none of which are natives of Britain.

ZODIAC, in astronomy, a broad circle, whose middle is the ecliptic, and its extremes two circles parallel thereto, at such a distance from it as to bound or comprehend the excursions of the sun and planets (see **ASTRONOMY**). It is a curious enough fact, that the solar division of the Indian zodiac is the same in substance with that of the Greeks, and yet that it has not been borrowed either from the Greeks or the Arabians. The identity, or at least striking similarity, of the division, is universally known; and M. Montucla has endeavoured to prove, that the Bramins received it from the Arabs. His opinion, we believe, has been very generally admitted; but in the second volume of the Asiatic Researches, the accomplished president Sir William Jones has proved unanswerably, that neither of those nations borrowed that division from the other; that it has been known among the Hindoos from time immemorial; and that it was probably invented by the first progenitors of that race, whom he considers as the most ancient of mankind, before their dispersion. The question is not of importance sufficiently general, straitened as we are by the limits prescribed us, for our entering into the dispute; but we think it our duty to mention it, that our astronomical readers, if they think it worth their while, may have recourse to the original writers for further information.

ZOEGERA, in botany: a genus of plants of the class *syngenesia* and order *polygamia fruticosa*. The receptacle is bristly; the pappus setaceous; the corollulae of the radius ligulated; the calyx imbricated. There are two species, the *capensis* and the *leptaurea*, neither of which are natives of Britain.

ZONE, in geography and astronomy, a division of the terraqueous globe with respect to the different degrees of heat found in the different parts thereof. The zones are denominated torrid, frigid, and temperate. The torrid zone is a band, surrounding the terraqueous globe, and terminated by the two tropics. Its breadth is 46° 58'. The equator, running through the middle of it, divides it into two equal parts, each containing 23° 29'. The ancients imagined the torrid zone uninhabitable. The temperate zones are contained between the tropics and the polar circles. The breadth of each is 43. 2. The frigid zones are segments of the surface of the earth, terminated, one by the antarctic, and the other by the arctic circle. The breadth of each is 46. 58.

ZOOLOGY,

IS that part of Natural History, which relates to *Animals*.

In order to abridge the study of zoology, many methods of reducing animals to classes, genera, and species, have been invented: but as that of Linnaeus is undoubtedly the best, the most extensive, and the most generally adopted, we shall give a brief account of it.

Linnaeus divides the whole animal kingdom into six classes. The characters of these six classes are taken from the internal structure of animals, in the following manner:—

CLASS I. MAMMALIA, includes all animals that suckle their young. The characters of this class are these:—The heart has two ventricles and two auricles; the blood is red and warm; and the animals belonging to it are *viviparous*.

CLASS II. AVES, or BIRDS. The characters are the same with those of Class I. excepting that the animals belonging to it are *oviparous*. See **BIRD** and **ORNITHOLOGY**.

CLASS III. AMPHIBIA, or AMPHIBIOUS ANIMALS. The heart has but one ventricle and one auricle; the blood is red and cold; and the animals belonging to this class have the command of their lungs, so that the intervals between *inspiration* and *expiration* are in some measure *voluntary*. See **AMPHIBIOUS**.

CLASS IV. PISCES, or FISHES. The heart has the same structure, and the blood the same qualities with those of the *Amphibia*; but the animals belonging to this class are easily distinguished from the *Amphibia*, by having no such voluntary command of their lungs, and by having external *branchiae* or *gills*. See **FISH** and **ICHTHYOLOGY**.

CLASS V. INSECTA, or INSECTS. The heart has one ventricle, but no auricle; the blood is cold and white; and the animals are furnished with *antenna* or *feelers*. See **INSECT**.

CLASS VI. VERMES, or WORMS. The characters are the same with those of Class V. only the animals have no antennae, and are furnished with *tentacula*.

The *First Class*, **MAMMALIA**, is subdivided into seven **ORDERS**; the characters of which are taken from the number, structure, and situation of the **TEETH**.

ORDER I. THE PRIMATES have four incisores, or *fore-teeth*, in each jaw, and one *dog-tooth*. N.B. By one dog tooth, Linnaeus means one on each side of the *fore-teeth* in both jaws.—This order includes four genera, viz. *Homo*, *Simia*, *Lemur*, *Vespertilio*.

ORDER II. THE BRUTA have no *fore-teeth* in either jaw. This order includes seven genera, viz. *Rhinoceros*, *Elephas*, *Trichechus*, *Bradypus*, *Myrmecophaga*, *Manis*, *Dalypus*.

ORDER III. THE FERÆ have, for the most part, six *conical fore-teeth* in each jaw. This order includes ten genera, viz. *Phoca*, *Canis*, *Felis*, *Viverra*, *Mustela*, *Ursus*, *Didelphis*, *Talpa*, *Sorex*, *Erinaceus*.

ORDER IV. THE GLIRES have two *fore-teeth* in each jaw, and no *dog-teeth*.—This order includes ten genera, viz. *Hystrix*, *Lepus*, *Castor*, *Mus*, *Sciurus*, *Myoxus*, *Cavia*, *Arctomys*, *Dipus*, *Hyrox*.

ORDER V. THE PECORA, have no *fore-teeth* in the upper jaw, but six or eight in the under jaw.—This order includes eight genera, viz. *Camelus*, *Moschus*, *Giraffa*, *Cervus*, *Antelope*, *Capra*, *Ovis*, *Bos*.

ORDER VI. THE BELLUE have *obtusé fore-teeth* in each jaw.—This order includes four genera, viz. *Equus*, *Hippopotamus*, *Sus*, *Tapir*.

ORDER VII. THE CETÆ or whale kind, have no uniform character in their teeth, being very different in the different genera; but are sufficiently distinguished from the other orders of *Mammalia*, by living in the ocean, having pectoral fins, and a *fistula* or *spiraculum* upon the head.—This order includes four genera, viz. *Monodon*, *Balaena*, *Physeter*, *Delphinus*. See **CETACEOUS**.

The generic characters of the *Mammalia* are, like those of the orders, almost entirely taken from the **TEETH**, excepting the *Vespertilio*, which, besides the character of the order derived from the teeth, has this farther mark, that there is a membrane attached to the feet and sides, by means of which the creature is enabled to fly:—the *Hyftrix*, whose body is covered with sharp spines:—and the whole order of *Pecora*, whose genera, besides the characters taken from the teeth, are distinguished into those which have *horns*, those which have *no horns*, and by peculiarities in the horns themselves.

The specific characters are very various, being taken from any part of the body which possesses a peculiar uniform mark of distinction. As examples of these characters are to be found under the proper name of each genus, it is unnecessary to say any thing further concerning them in this place.

The *Second Class*, **AVES**, is subdivided into six **ORDERS**; the characters of which are taken chiefly from the structure of the **BILL**.

ORDER I. THE ACCIPITRES have a **HOOKEED BILL**, the superior mandible, near the base, being extended on each side beyond the inferior; and in some it is armed with *teeth*.—This order includes four species, viz. *Vultur*, *Falco*, *Strix*, *Lanius*.

ORDER II. THE PICÆ have a convex, compressed **BILL**, resembling a knife.—This order contains 23 genera, viz. *Trochilus*, *Certhia*, *Upupa*, *Glaucoptes*, *Buphaga*, *Sitta*, *Oriolus*, *Coracias*, *Gracula*, *Corvus*, *Paradisæa*, *Ramphastos*, *Trogon*, *Pittacus*, *Crotophaga*, *Picus*, *Yunx*, *Cuculus*, *Bucco*, *Boccorus*, *Alcedo*, *Merops*, *Todus*.

ORDER III. THE ANSERES have a smooth **BILL**, broadest at the point, covered with a smooth skin, and furnished with teeth: the tongue is fleshy; and the toes are palmated or webbed.—This order includes 13 genera, viz. *Anas*, *Mergus*, *Phaeton*, *Plotus*, *Rhynchops*, *Diomedea*, *Aptenodyta*, *Alca*, *Procellaria*, *Pelecanus*, *Larus*, *Sterna*, *Colymbus*.

ORDER IV. THE GRALLÆ have a somewhat cylindrical **BILL**: the tail is short, and the thighs are naked.—This order contains 20 genera, viz. *Phonocropterus*, *Platalea*, *Palamedes*, *Mycteria*, *Tantalus*, *Ardea*, *Coriira*, *Recurvirostra*, *Scolopax*, *Tringa*, *Fulica*, *Parra*, *Rallus*, *Vaginalis*, *Plophia*, *Cancroma*, *Scopus*, *Glareola*, *Hamatopus*, *Charadrius*.

ORDER V. THE GALLINÆ have a convex **BILL**; the superior mandible is vaulted over the inferior: the *nostrils* are half covered with a convex cartilaginous membrane; and the feet are divided, but connected, at the inmost joint.—This order contains 10 genera, viz. *Otis*, *Struthio*, *Didus*, *Pavo*, *Meleagris*, *Penelope*, *Crax*, *Phasianus*, *Nimidia*, *Tetrao*.

ORDER VI. THE PASSERES have a conical sharp pointed

BILL; and the *nostrils* are oval, wide, and naked.—This order contains 17 genera, *viz.* Loxia, Colius, Fringilla, Phytotoma, Emberiza, Caprimulgus, Hirundo, Pipra, Turdus, Ampelis, Tanagra, Mucicapa, Parus, Motacilla, Alauda, Sturnus, Columba.

The *generic* characters of this class are taken from peculiarities in the *bill*, the *nostrils*, the *tongue*, the *feet*, the *feathers*, the *face*, the *figure of the body*, &c.

The characters which serve to distinguish the *species* are very various: for example, the *colour* of the particular *feathers* or parts of *feathers*; *crests* of feathers on the head, disposed in different manners; the *colour* of the *cere* or *wax*; the *colour* of the *feet*; the *shape* and *length* of the *tail*; the *number*, *situation*, &c. of the *toes*; the *colour* and *figure* of the *bill*, &c.

The *Third Class*, AMPHIBIA, is divided into two ORDERS.

ORDER I. THE REPTILES have four *feet*, and breathe by the *mouth*.—This order contains four genera, *viz.* Testudo, Draco, Lacerta, Rana.

ORDER II. THE SERPENTES have no *legs*, and breathe by the *mouth*.—This order contains six genera, *viz.* Crotalus, Boa, Coluber, Anguis, Amphibena, Cæcilia.

The *generic* characters of this class are taken from the *general figure of the body*; from their having *tails* or *no tails*; being covered with a *shell*; having *teeth* or *no teeth* in the *mouth*; being furnished with *horns*; having covered or naked bodies; from the *number*, *situation*, and *figure* of the *scuta* and *scales*; from the *number* and *situation* of the *spiracula*; from the *situation* of the *mouth*, &c.

The *specific* characters are so very various, that it would be superfluous to enumerate them.

The *Fourth Class*, PISCES, is subdivided into six ORDERS, the characters of which are taken from the *situation* of the *belly fins*.

ORDER I. THE APODES have no *belly fins*.—This order contains eight genera, *viz.* Murena, Gymnotus, Trichiurus, Anarchichas, Ammodytes, Ophidium, Stromateus, Xiphias, Sternoptyx, Leptocephalus.

ORDER II. THE JUGALARES have the *belly fins* placed before the *pectoral fins*.—This order includes five genera, *viz.* Callionymus, Uranoscopus, Trachinus, Gadus, Blennius, Kurtus.

ORDER III. THE THORACICI have the *belly fins* placed under the *pectoral fins*.—This order comprehends 19 genera, *viz.* Cepala, Echenis, Coryphæna, Gobius, Cottus, Scrophæna, Zeus, Pleuronectes, Chætodon, Sparus, Scarus, Labrus, Sciaenæ, Perca, Gasterosteus, Scomber, Centrogaster, Mullus, Trigla.

ORDER IV. THE ABDOMINALES have the *belly fins* placed behind the *pectoral fins*.—This order contains 16 genera, *viz.* Cobitis, Amia, Silurus, Teuthis, Loricaria, Salmo, Ptilularia, Esox, Elops, Argentina, Aluterina, Mugil, Exocoetus, Polyne-mus, Clupea, Cyprinus.

ORDER V. THE BRANCHIOSTEGI have the *gills* destitute of bony rays.—This order contains 10 genera, *viz.* Mormyrus, Olfiracion, Tetradon, Diodon, Syngnathus, Pegafus, Centricetus, Balistes, Cyclopterus, Lophius.

ORDER VI. THE CHONDROPTERYGII have cartilaginous *gills*.—This order contains five genera, *viz.* Acipenser, Chimæra, Squalus, Raia, Petromyzon.

The *generic* characters of this class are taken from peculiarities in the *head*, the *mouth*, the *teeth*, the *nostrils*, the *rays* in the *membrane* of the *gills*, the *eyes*, the *general figure* of the *body*, the *figure* of the *tail*, the *situation* of the *spiracula*, &c.

The *specific* characters are taken from peculiarities in all the parts above enumerated, and many others.

See further the articles FISH and ICHTHYOLOGY.

The *Fifth Class*, INSECTA, is subdivided into seven ORDERS, the characters of which are taken from the wings: See the article INSECT.

ORDER I. THE COLEOPTERA have four wings, the two superior ones being crustaceous, and furnished with a *straight future*.—This order comprehends 47 genera, *viz.* Scarabæus, Lucanus, Dermestes, Melysrus, Byrrhus, Silpha, Tritoma, Hydrophilus, Hister, Psephenus, Bostrichus, Anthrenus, Nitidula, Coccinella, Curculio, Brentus, Attelabus, Erodium, Staphylinus, Scaurus, Zygia, Meloe, Tenebrio, Cassida, Opatrum, Mordella, Chryfomela, Horia, Apalus, Manticora, Pimelia, Gyrimus, Cucujus, Cryptoccephalus, Bruchus, Pissinus, Hispa, Buprestis, Necydalis, Lampyrus, Cantharis, Notoxus, Elater, Calopus, Alurnus, Carabus, Lytta, Serpophalus, Cerambyx, Leptura, Rhinomacrus, Zonitis, Cicindela, Dytiscus, Forficula.

ORDER II. THE HEMIPTERA have four wings, the two superior ones being *semicrustaceous* and *incumbent*, i. e. the *interior edges* lie above one another.—This order includes 14 genera, *viz.* Blatta, Pneumora, Mantis, Gryllus, Fulgora, Cicada, Notonecta, Nepa, Cimex, Macrocephalus, Aphis, Chermes, Coccus, Thrips.

ORDER III. THE LEPIDOPTERA have four wings, all of them imbricated with *scales*.—This order contains three genera, *viz.* Papilio, Sphinx, Phalaena.

ORDER IV. THE NEUROPTERA have four wings, interwoven with veins, like a piece of *network*, and *no wing* in the *anus*.—This order includes seven genera, *viz.* Libella, Ephemeræ, Hemerobius, Myrmelion, Phryganea, Panorpa, Rophidia.

ORDER V. THE HYMENOPTERA have the same characters with the former, only the *anus* is armed with a *sting*. But this mark is peculiar to the *females* and *neuters*; for the males have *no sting*. This order comprehends 15 genera, *viz.* Cynips, Tentredo, Sirex, Ichneumon, Spheg, Scolia, Thynnus, Leucospis, Tiphia, Chalcis, Chrysis, Vespa, Apis, Formica, Mutilla.

ORDER VI. THE DIPTERA have two wings, and two *clawed halteres* or *balances* behind each wing.—This order contains 12 genera, *viz.* Diopsis, Tipula, Musca, Tabanus, Empis, Conops, Oestrus, Ailus, Stomoxys, Culex, Bombylius, Hippoboscæ.

ORDER VII. THE APTERA have no wings.—This order contains 15 species, *viz.* Lepisma, Podura, Termites, Pediculus, Pulex, Acarus, Hydrachna, Aranea, Phalangium, Scorpio, Cancer, Monoculus, Oniscus, Scolopendra, Julus. See further the articles ENTOMOLOGY and INSECT.

The *Sixth Class*, VERMES, is divided into five ORDERS.

ORDER I. THE INTESTINA are the most *simple animals*, being perfectly *naked*, and without *limbs* of any kind.—This order contains 21 genera, *viz.* Ascaris, Trichocephalus, Uncinaria, Tilaria, Scolex, Ligula, Linguatula, Strongylus, Echinorhynchus, Hæruca, Cucullanus, Caryophyllæus, Fasciola, Trænia, Furia, Myxine, Gordius, Hirudo, Lumbricus, Sipunculus, Planaria.

ORDER II. THE MOLLUSCA are likewise *simple naked animals*, without any *shell*; but they are *beachiated*, or furnished with a kind of *limbs*.—This order comprehends 31 genera, *viz.* Aetina, Clava, Mammaria, Pedicellaria, Alcidia, Salpa, Dasyatis, Pterotrachea, Limax, Aplysia, Doris, Tethis, Holothuria, Terebella, Triton, Sepia, Clio, Lobaria, Lernæa, Scyllæa,

Glancus, Aphrodita, Amphitrite, Spio, Nereis, Nais, Physophora, Medusa, Lucernaria, Aterias, Echinus.

ORDER III. The TESTACEA have the same characters with those of Order II. but are covered with a *shell*.—This order includes 36 genera, *viz.* Chiton, Lepas, Pholas, Mya, Solen, Tellina, Cardium, Mastra, Donax, Venus, Spondylus, Chama, Arca, Ostrea, Anomia, Mytilus, Pinna, Argonauta, Nautilus, Conus, Cypraea, Bulla, Voluta, Buccinum, Strombus, Murex, Trochus, Turbo, Helix, Nerita, Haliotis, Patella, Dentalium, Serpula, Terebo, Sabella.

ORDER IV. The ZOOPHYTA are compound animals, furnished with a kind of *flowers*, and having a vegetating root and *stem*.—This order contains 15 genera, *viz.* Tubipora, Ma-

drepora, Millepora, Cellepora, Isis, Antipathes, Gorgonia, Alcyonium, Spongia, Flustra, Tubularia, Corallina, Sertularia, Pennatula, Hydra. See ANIMAL Flower.

ORDER V. The INFUSORIA consists of very small *simple animals*.—This order contains 15 genera, *viz.* Brachionus, Vorticella, Trichoda, Cercaria, Leacopera, Gonium, Colpoda, Paramacium, Cycloidium, Burfaria, Vibrio, Eichelis, Bacillaria, Volvox, Monas.

For more particular information concerning the several branches and subjects of zoology, the reader may consult the various articles above referred to, and he will find most of the genera described in their order in the alphabet.

Z O S

ZOOPHYTE, in natural history, the 4th order of the class of *Vermes*. See ZOOLOGY.

ZOOTOMY, the art of dissecting animals or living creatures, being the same with anatomy. See ANATOMY and COMPARATIVE Anatomy.

ZORILLE, in zoology, a species of weasel, having the back and sides marked with short stripes of black and white, the last tinged with yellow; the tail long and bushy, partly white and partly black; the legs and belly black. This animal inhabits Peru, and other parts of South America: its pestilential vapour overcomes even the panther of America, and supposes that formidable enemy.

ZOROASTER, or ZERDUSHT, a celebrated ancient philosopher, said to have been the reformer or the founder of the religion of the magi. It is wholly uncertain to how many eminent men the name of Zoroaster belonged. Some have maintained that there was but one Zoroaster, and that he was a Persian; others have said that there were six eminent founders of philosophy of this name. Ham, the son of Noah, Moses, Osiris, Mithras, and others, both gods and men, have, by different writers, been asserted to have been the same with Zoroaster. Many different opinions have also been advanced concerning the time in which he flourished. Aristotle and Pliny fix his date at so remote a period as 6000 years before the death of Plato. According to Laertius, he flourished 600 years before the Trojan war; according to Suidas, 500. If, in the midst of so much uncertainty, any thing can be advanced with the appearance of probability, it seems to be this; that there was a Zoroaster, a Perso-Median, who flourished about the time of Darius Hytaspes; and that besides him there was another Zoroaster, who lived in a much more remote period among the Babylonians, and taught them astronomy. The Greek and Arabian writers are agreed concerning the existence of the Persian Zoroaster; and the ancients unanimously ascribe to a philosopher, whom they call *Zoroaster*, the origin of the Chaldean astronomy, which is certainly of much earlier date than the time of Hytaspes: it seems, therefore, necessary to suppose a Chaldean Zoroaster distinct from the Persian. Concerning this Zoroaster, however, nothing more is known, than that he flourished towards the beginning of the Babylonish empire, and was the father of the Chaldean astrology and magic. All the writings that have been ascribed to Zoroaster are unquestionably spurious.

ZOSTERA, in botany: a genus of plants of the class *gyandria*, order *polyandria*; and in the natural system arranged under the second order, *Piperitæ*. The spadix is linear, and fertile only on one side; there is no calyx nor corolla; the stamina are alternate; the seeds solitary and alternate. There

Z U G

are two species, the marina and oceanica; neither of which is a native of Britain.

ZOSIMUS, an ancient historian who lived at the end of the fourth and beginning of the fifth centuries. There are six books of his history extant; in the first of which he runs over the Roman affairs in a very succinct manner from Augustus to Dioclesian; the other five are written more diffusely. Zosimus was a zealous Pagan; whence we find him frequently inveighing with great bitterness against the Christian princes, particularly against Constantine the Great, and the elder Theodosius. His history has been published with the Latin version of Leunclavius at Frankfort, 1590, with the other minor historians of Rome, in folio; and at Oxford in 8vo. 1679.

ZUG, a canton of Switzerland, bounded on the north and east by Zurich, on the south by Schweiz; and on the west by Lucern; only about ten miles long, and nearly as much in breadth. The pastures here are excellent, and it produces also a sufficiency of grain, with plenty of fruit, and some wine; on one side of the Zug Lake, the country is covered with chestnut-trees, which form a very profitable branch of trade, by the sale of the nuts to the neighbouring countries. This district, on the extinction of the counts of Lenzburg, devolved to those of Kyburg, which latter also failing, it came to the counts of Habsburg, and in them to the House of Austria, towards which it always manifested an inviolable attachment; but in the year 1352 the town of Zug being besieged by the Helvetic confederacy, and not only neglected by the archduke, but even recommended by him to surrender, it followed his advice, and was admitted into the confederacy, to which its territory had previously acceded. This canton is the seventh in rank, and among the lesser ones the fifth, besides which, it is in a particular manner connected with Lucern, Uri, Schweiz, and Unterwalden, commonly called the five territorial confederates. The government of this canton is entirely democratical; the supreme council being lodged in the landgemeine, which meets annually in the town of Zug. In this council, every male of sixteen years of age is possessed of a vote, and here also all public posts are conferred. It is composed of deputies from the several quarters of the canton. The chief person here is the amman, who is elected alternately from the town and the territory, though with this difference, that the town amman continues in office three years, but the country amman two; this officer must always reside in the town; next to him is the statthalter, who has the keeping of the provincial seal. The people of this canton are reckoned the most restless of Switzerland; their general assemblies are often tempestuous, though seldom attended with bloodshed.

ZUINGLIUS (**ULRICUS**), an able and zealous reformer of the church, was born at Wildehausen in Switzerland, in 1487.—He was sent to school at Basel early, and thence removed to Bern, where he learned the Greek and Hebrew tongues. He studied philosophy at Vienna, and divinity at Basel, where he was admitted doctor in 1505. He began to preach with good success in 1506, and was chosen minister of Olaris, a chief town in the canton of the same name, where he continued till 1516. Then he was invited to Zurich, to undertake the principal charge of that city, and to preach the word of God there. He died in 1531, having written several books in defence of his doctrines. His works amounted to 4 vols. in folio, the greatest part of which were written in German, and afterwards translated into Latin.

ZURIC, or **ZÜRICH**, a canton of Switzerland, and first in rank, bounded on the north by Swabia and the canton of Scaffhausen, on the east by the Thurgau and the county of Toggenburg, on the south by the cantons of Schwitz and Zug, and on the west by the county of Baden. This canton is not unaptly called an epitome of all Switzerland, as containing in it hills, valleys, plains, corn-lands, vineyards, lakes, rivers, vegetables of all kinds, and whatever else is necessary to the support of life. Grain is cultivated all over the country; but it ripens later in the mountainous parts, where the air is coldest, than in the levels or sunny valleys. The hilly grounds in the east, west, and south borders, afford a specimen of the fertile Alps, as abounding in cattle, milk, butter, and cheese: at first the wines have a tartness attending them, yet they improve by keeping; and, after lying some years in the cask, become smooth, pleasant, and wholesome. Fruits also are every-where found in great plenty, and very good. The most remarkable minerals and soils are chalk, potter's earth of several sorts and colours, sulphur, and pit-coal; some mineral springs are likewise found. The proportion of grain to the other productions of the earth, will appear from the following calculation: there are 217,424 acres laid out in grain, 134,466 in vines, 94,553 in meadows, 42,519 in pasturage, and 103,772 in forests. As sufficient corn is not produced for the interior consumption, the deficiency is chiefly supplied from Swabia. In order to prevent a scarcity of this material article, a public granary is maintained, at the expence of government, for grain at the common price; but, in seasons of scarcity, it is sold considerably cheaper than it can be purchased at the market. The canton contained, in 1784, 174,572 souls, including 10,500 in the capital: this large population, in proportion to the size of the canton, is owing to the trade of Zurich; as, at least, two-thirds of the inhabitants derive their livelihood by spinning thread and silk, and making linen for the manufactures of the town. The sovereign power resides exclusively in the burgesies of the town, consisting of about 2000. The reformation was begun by Zuinglius, in the year 1517, in the town of Zurich; and in 1524 gained footing in the whole canton.

ZURICH, a city of Switzerland, and capital of a canton of the same name, situated on a large lake, where the river Limmat is discharged, which divides it into two parts, supposed to have been built on the site of the ancient Tigurum, which was destroyed by the Allemanni. Zurich was formerly an imperial city, and obtained from the Emperor (Frederic II.) very considerable privileges, which were acknowledged and augmented by several of his successors. The civil war between the magistrates and the people, in the year 1335, nearly reduced the city to ruins; but the former being banished, the citizens, in 1337, established a new form of government, which was confirmed by the Emperor Louis of Bavaria. The ex-

iles, after several fruitless attempts, were at length re-admitted; but engaging in a conspiracy against the city, were discovered, and put to death. In consequence of this transaction, the nobles in the neighbourhood took up arms; and Zurich, after having ineffectually applied for assistance to the Emperor Charles IV. formed an alliance with Lucerne, Uri, Schwitz, and Underwalden, and was admitted a member of their confederacy: this event happened in the year 1351. The four cantons yielded the pre-eminence to Zurich: a privilege it enjoys at present; being the first canton in rank, and the most considerable in extent, both of territory and power, next to Berne. In the same year, Zurich was assisted by the four cantons against Albert duke of Austria, who besieged the town, and was repulsed with great loss. Zurich was the first town in Switzerland that separated from the church of Rome, being converted by the arguments of Zuinglius. The town is divided into two parts; the old part, surrounded with the same ancient battlements and towers which existed in the thirteenth century; and the suburbs, which are strengthened by fortifications in the modern style, but too extensive. The ditches, instead of being filled with stagnant water, are mostly supplied with running streams. The inhabitants are very industrious, and carry on with success several manufactures: the principal are those of linens and cottons, muslins and silk handkerchiefs. The manufacturers do not, in general, dwell within the walls; but the materials are mostly prepared, and the work is completed in the adjacent districts; for this reason, Zurich does not exhibit the activity and numbers of a great commercial city: the environs, on the contrary, are so extremely populous, that, perhaps, few districts in the neighbourhood of a town, whose population scarcely exceeds 10,500 inhabitants, contain, within so small a compass, so many souls. The streets are mostly narrow; the houses and public buildings accord more with plainness and convenience than with the elegance and splendour of a capital. The town contained, in 1780, 10,559 souls. Among their sumptuary laws, the use of a carriage in the town is prohibited to all sorts of persons, except strangers. The militia of the canton amounted, in 1781, to 25,718 infantry, 1025 artillery, 885 dragoons, and 405 chasseurs; in all, 28,235 effective men. The arsenal is well supplied with cannon, arms, and ammunition, and contains a reserve of muskets for 30,000 men: 41 miles S.E. Bâle, and 36 S.W. Constance. Long. 26. 9. E. Ferro. Lat. 47. 22. N. **ZURICH**, a lake of Switzerland, in a canton to which it gives name: 22 miles long, and two wide. It is divided into Upper and Lower.

ZUTPHEN, a strong and considerable town of the United Provinces in Guelderland, and capital of a county of the same name. It has a magnificent church, and is surrounded with walls. It was taken by the French in 1672, who, in 1674, delivered it up to the states-general. It is seated at the confluence of the rivers Berkel and Yessel, nine miles south-east of Deventer, and 55 east by south of Amsterdam. E. Long. 6. 0. N. Lat. 52. 10.

ZUYDER-ZEE, a great gulph or bay of the German Ocean, which extends from south to north in the United Provinces, between Friesland, Over-Yessel, Guelderland, and Holland. It is so called from its situation towards the south. It is said that the Zuyder-zee was formerly a lake, and that the land is swallowed up which united North-Holland with Friesland.

ZYGOMA, in anatomy, a bone of the head; or rather an union or assemblage of two processes or eminences of bones; the one from the os temporis, the other from the os maxillæ.

these processes are hence termed the *zygomatic processes*, and the future that joins them together is denominated the *zygomatic future*. See ANATOMY.

ZYGOMATICUS, in anatomy, a muscle of the head, arising from the *Os ZYGOMA*, whence its name, and terminating at the angle of the lips.

ZYGOPHYLLUM, BEAN-CAPER, in botany: a genus of plants of the class of decandria and order monogynia, and in the natural system arranged under the 14th order, *Grinales*. There are eleven species, partly shrubby and partly herbaceous

plants, all natives of warm climates, though some of them are hardy enough to endure the open air in this country.

ZYMOSIMETER (formed from *ζυμωσις* fermentation, and *μετρος* measure), an instrument proposed by Swammerdam in his book *De Respiratione*, wherewith to measure the degree of fermentation occasioned by the mixture of different matters, and the degree of heat which those matters acquire in fermenting, as also the heat or temperament of the blood of animals.

AARON, high-priest of the Jews, and brother to Moses, was by the father's side great-grandson, and by the mother's grandson, of Levi. By God's command he met Moses at the foot of Mount Horeb, and they went together into Egypt to deliver the children of Israel: he had a great share in all that Moses did for their deliverance; the scriptures call him the prophet of Moses, and he acted in that capacity after the Israelites had passed over the Red Sea. He ascended Mount Sinai with two of his sons, Nadab and Abihu, and seventy elders of the people; but neither he nor they went higher than half way, from whence they saw the glory of God: only Moses and Joshua went to the top, where they staid forty days. During their absence, Aaron, overcome by the people's eager intreaties, set up the golden calf, which the Israelites worshipped by his consent. This calf has given rise to various conjectures. Some rabbies maintain, that he did not make the golden calf, but only threw the gold into the fire, to get rid of the importunities of the people; and that certain magicians, who mingled with the Israelites at their departure from Egypt, cast this gold into the figure of a calf. According to some authors, the fear of falling a sacrifice to the resentment of the people, by giving a refusal, made Aaron comply with their desire: and they allege also, that he hoped to elude their request, by demanding of the women to contribute their ear-rings, imagining they would rather choose to remain without a visible deity, than be deprived of their personal ornaments. This affair of the golden calf happened in the third month after the Israelites came out of Egypt. In the first month of the following year, Aaron was appointed high-priest by God, which office he executed during the time that the children of Israel continued in the wilderness. He died in the fortieth year after their departure from Egypt, upon Mount Hor, being then 123 years old; A. M. 2522, of the Julian period 3262, before the Christian era 1452.

AARON BEN ASER, a celebrated rabbi, who, in the fifth century, had a share in the invention of the Hebrew points and accents.

AARON of Alexandria, a Christian priest and physician, who flourished in Egypt about the year 621. He is the most ancient author who has treated of the small-pox.

AARON HARRISON, a learned rabbi and caraites in the 13th century, wrote an Hebrew grammar, printed at Constantinople 1581; probably the same with Aaron the caraites, who

wrote a commentary on the five books of Moses, which is in MS. in the French king's library.

AARENS (Peter), a painter, called in Italy Pietro Longo, because of his stature, was born at Amsterdam 1519. He was eminent for all kinds of subjects; but was particularly famous for altar-pieces, and for representing a kitchen with its furniture: he had the pain to see a fine altar-piece of his destroyed by the rabble in the insurrection 1566, though a lady of Alcmæer offered 200 crowns for its redemption.

AARENS (Francis), lord of Someldyck and Spyeck, was one of the greatest ministers for negotiation the United Provinces could ever boast of. Cornelius Aarfens, his father, was register to the States; and being acquainted with Mr. du Pleffis Mornay at the court of William prince of Orange, he prevailed upon him to take his son under him, with whom he continued some years. John Olden Barneveldt, who presided over the affairs of Holland and all the United Provinces, sent him afterwards agent into France; where he learned to negotiate under those profound politicians, Henry IV. Villeroy, Rosny, Sillery, Jeannin, &c.; and he acquitted himself so well as to obtain their approbation. Soon after he was invested with the character of ambassador, being the first who was recognized as such by the French court; at which time Henry IV. declared that he should take precedence next to the Venetian minister. He resided in France fifteen years; during which time he received great marks of esteem from the king, who created him a knight and baron; and for this reason he was received amongst the nobles of the province of Holland. However, he became at length so odious to the French court, that they desired to have him recalled. He was afterwards deputed to Venice, and to several German and Italian princes, upon occasion of the troubles in Bohemia: this was in 1620; "and it is to be observed," says Mr. Wicquefort, "that the French king ordered the Duke of Angoulême, the Count of Methune, and Abbé des Preaux, his three ambassadors, not to receive visits from Mr. Aarfens who came from the States of the United Provinces to negotiate with some German and Italian princes, upon the same affairs of Bohemia for which the ambassadors of France had been deputed. The order sent for this purpose signified, "that it was not intended as any indignity to the States, with whom the king was desirous to live always in friendship, but entirely upon account of Mr. Aarfens, for his having acted in a manner inconsistent with the interest and dignity of his majesty."

Mr. Aarsens was the first of three extraordinary ambassadors sent to England in 1620; and the second, in 1641. In this last embassy, his colleagues were the lord of Brederode, first ambassador, and Hermisvliet, as third; they were to treat about the marriage of Prince William, son to the Prince of Orange. He was also ambassador extraordinary at the French court in 1624; and Cardinal Richelieu having just taken the administration into his hands, and knowing he was an able man, made use of him to serve his own purposes. Aarsens died in a very advanced age; and his son, who survived him, was reputed the wealthiest man in Holland. He has left very accurate and judicious memoirs of all those embassies in which he was employed; and it must be observed, that the various instructions given him by the States, and all the credential letters he carried in his later embassies, were drawn by himself; "whence we may conclude," says Mr. Wicquefort, "that he was the ablest person in all that country, not only for conducting of negotiations, but for instructing ambassadors what to negotiate upon."—Du Maurier, in his memoirs, says, "that he was of a spirit the most dangerous which ever arose in the United Provinces, and the more to be dreaded, as he concealed all the malevolence and artifice of foreign courts under the appearance of Dutch bluntness and simplicity; that he was vehement and persuasive, could advance arguments in favour of the worst causes, had an intriguing genius, and had kept a secret correspondence with some great men in France, whose conduct was not only suspected, but highly offensive to the king; and that, having bribed the French ambassador's secretary at the Hague, he thereby discovered the most secret designs of the French court." By this account we may see that Aarsens was a man of great abilities, and had an excellent turn for political negotiations.

AARTGEN, or AERTGEN, a painter of merit, was the son of a wool-comber, and born at Leyden in 1498. He worked at his father's trade till he was eighteen, and then, having discovered a genius for designing, he was placed with Cornelius Engelhechtz, under whom he made a considerable progress in painting. He became so distinguished, that the celebrated Francis Floris went to Leyden out of mere curiosity to see him. He found him inhabiting a poor half-ruined hut, and in a very mean style of living; he solicited him to go to Antwerp, promising him wealth and rank suitable to his merit, but Aartgen refused, declaring, that he found more sweets in his poverty than others did in their riches. It was a custom with this painter never to work on Mondays, but to devote that day with his disciples to the bottle. He used to stroll about the streets in the night, playing on the German flute; and in one of those frolics he was drowned in 1564.

ABA (or rather ABAY) HANISAH, surnamed Al-Nooman, was the son of Thabet, and born at Cousah in the 80th year of the Hegira; this is the most celebrated doctor of the orthodox Mussulmans, and his sect holds the principal esteem among the four which they indifferently follow. Notwithstanding this, he was not very well esteemed during his life, inasmuch that the khaliff Almanzor caused him to be imprisoned at Bagdat, for having refused to subscribe to the opinion of absolute predestination, which the Mussulmans called Cadha. But afterwards Abou Joseph, who was the sovereign judge or chancellor of the empire, under the khaliff Hadi, brought his doctrine into such credit, that it became a prevailing opinion, that to be a good Mussulman was to be a Hanafite. He died in the 150th year of the Hegira, in the prison of Bagdat aforesaid. And it was not till 375 years after his death, that Melick Schah, a sultan of the Selgucidan race, built for him a magnificent monument in the same city, whereto he adjoined a college peculiarly appropriated to such as made a profession of this sect. This was in the 485th

year of the Hegira, and Anno Christi 1092. The most eminent successors of this doctor were Ahmed Benali, Al Giasias, and Al Razi, who was the master of Nassiri; and there is a mosque particularly appropriated to them in the temple of Mecca.

ABACISCUS, in architecture, the same with ABACUS; for which, see *Encyclopædia*.

ABADDON, is the name which St. John in the Revelations gives to the king of the locusts, the angel of the bottomless pit. The inspired writer says, this word is Hebrew, and in Greek signifies *Ἀβaddon*, i. e. a *destroyer*. That angel-king is thought to be Satan; or the devil: but Mr. le Clerc thinks, with Dr. Hammond, that by the locust which came out of the abyss, may be understood the zealots and robbers, who miserably afflicted the land of Judea, and laid it in a manner waste, before Jerusalem was taken by the Romans; and that Abaddon, the king of the locusts, may be John of Gischala, who, having treacherously left that town a little before it was surrendered to Titus, came to Jerusalem, where he soon headed part of the zealots, who acknowledged him as their king, whilst the rest would not submit to him. This subdivision of the zealot-party brought a thousand calamities on the Jews.

ABADIR, a title which the Carthaginians gave to gods of the first order. In the Roman mythology, it is the name of a stone which Saturn swallowed; by the contrivance of his wife Opa, believing it to be his new-born son Jupiter; hence it ridiculously became the object of religious worship.

ABÆ, or ΑΒΑ, a town of Phocis in Greece, near Helicon; famous for an oracle of Apollo older than that at Delphi, and for a rich temple plundered and burnt by the Persians. (Strabo.)

ABAKANSKOI, a fortified town of Siberia, in the province of Tobolsk, seated on the Janekka. Long. 94. 5. E. Lat. 53. 5. N.

ABALIENATUS, among physicians, means corrupted. When applied to the body, it signifies that a part is so destroyed as to require extirpation. When applied to the senses, it expresses their total destruction.

ABALLABA, now *Appleby*, a town in Westmoreland, remarkable only for its antiquity, having been a Roman station. (Notitia Imperii.) See *APPLEBY*.

ABANA (Bible), otherwise *Amara*, a river of Phœnicia, which, rising from Mount Hermon, washes the south and west sides of Damascus, and falls into the Phœnician sea, to the north of Tripolis, called *Corymborhoas* by the Greeks.

ABANTES, a people who came originally from Thrace, and settled in Phœcia, a country of Greece, where they built a town which they called Abas, after the name of Abas their leader; and, if we may credit some ancient authors, the Abantes went afterwards into the island Eubœa, now called Negropont: others say, the Abantes of Eubœa came from Athens. The Abantes were a very warlike people, closing with their enemies, and fighting hand to hand. See next article.

ABANTIAS, or ABANTIS, a name of the island Eubœa, in the Egean sea, extending along the coast of Greece, from the promontory Sunium of Attica to Thessaly; and separated from Bœotia by a narrow strait, called Euripus. From its length the island was formerly called *Macris*; afterwards *Abantias*, or *Abantis*, from the Abantes, a people originally of Thrace, called by Homer *ἰσθμίου νοτίωνες*, from wearing their hair long behind, having in a battle experienced the inconvenience of wearing it long before; and from cutting their forelocks, they were called *Curetes*. (*Abantæus*, the epithet.) Ovid.) See *ABANTES*, above.

ABARIM, high mountains of steep ascent, separating the

country of the Ammonites and Moabites from the land of Canaan, where Moses died. According to Josephus, they stood opposite to the territory of Jericho, and were the last station but one of the Israelites coming from Egypt. Nebah and Pithah were parts of these mountains.

ABARIS, the Hyperborean; a celebrated sage of antiquity, whose history and travels have been the subject of much learned discussion. Such a number of fabulous stories were told of him, that Herodotus himself seems to scruple to relate them. He tells us only, that this barbarian was said to have travelled with an arrow, and took no sustenance: but this does not acquaint us with the marvellous properties which were attributed to that arrow; nor that it had been given him by the Hyperborean Apollo. With regard to the occasion of his leaving his native country, Harpocration tells us, that the whole earth being infested with a deadly plague, Apollo, upon being consulted, gave no other answer, than that the Athenians should offer up prayers in behalf of all other nations; upon which, several countries deputed ambassadors to Athens, among whom was Abaris the Hyperborean. In this journey he renewed the alliance between his countrymen and the inhabitants of the island of Delos. It appears that he also went to Lacedæmon; since, according to some writers, he there built a temple consecrated to Proserpine the Salutory. It is asserted, that he was capable of foretelling earthquakes, driving away plagues, laying storms, &c. He wrote several books, as Suidas informs us, viz. Apollo's Arrival into the Country of the Hyperboreans; The Nuptials of the River Hebrus; *Θεογυνα*, or the Generation of the Gods; A Collection of Oracles; &c. Himerius, the sophist, applauds him for speaking pure Greek; which attainment will be no matter of wonder to such as consider the ancient intercourse there was between the Greeks and Hyperboreans. As to what relates to his abilities, Himerius informs us, that "he was affable and pleasant in conversation, in dispatching great affairs secret and industrious, quick-sighted in present exigencies, in preventing future dangers circumspect, a searcher after wisdom, desirous of friendship, trusting in deed little to fortune, and having every thing trusted to him for his prudence." Neither the Academy nor the Lyceum could have furnished a man with fitter qualities to travel so far abroad, and to such wise nations, about affairs no less arduous than important. And if we further attentively consider his moderation in eating, drinking, and the use of all those things which our natural appetites incessantly crave; joining the candour and simplicity of his manners with the solidity and wisdom of his answers, all which we find sufficiently attested; it must be owned, that the world at that time had few to compare with Abaris.

ABAS, in the heathen mythology, was the son of Hypochoon and Meganira, who entertained Ceres, and offered a sacrifice to that goddess; but Abas ridiculing the ceremony, and giving her opprobrious language, she sprinkled him with a certain mixture she held in her cup, on which he became a newt or water-lizard.

ABAS (Schah) the Great, was third son of Codabendi, seventh king of Persia, of the race of the Sophis. Succeeding to his father at 18, in 1585, he found the affairs of Persia at a low ebb, occasioned by the conquests of the Turks and Tartars. He regained several of the provinces they had seized; but death put a stop to his victories in 1629, after a reign of 44 years. He was the greatest prince that had reigned in Persia for many ages; and it was he who made Isfahan the metropolis of Persia; his memory is held in the highest veneration among the Persians.

ABAS (Schah), his grandson, ninth king of Persia, of the race of the Sophis, succeeded his father Sefi at 13 years of age.

age: he was but 18 when he made himself master of the city of Candahar, which had surrendered, in his father's reign, to the Great Mogul, and all the provinces about it; and he preserved it afterwards against this Indian emperor, though he besieged it more than once with an army of 300,000 men. He was a very merciful prince, and openly protected the Christians: he had formed a design of extending the limits of his kingdom toward the north, and had for that effect levied a powerful army; but death put a stop to all his great designs, at 37 years of age, in 1666.

ABASCIA, or ABASIA, a country in Asia, tributary to the Turks, situated on the coast of the Black Sea. The people are poor, thievish, and treacherous, inasmuch that there is no trading with them without the utmost caution. Their commodities are furs, buck and tyger skins, linen yarn, box-wood, and bees-wax: but their greatest traffic is in selling their own children, and even one another, to the Turks; inasmuch that they live in perpetual distrust. They are destitute of many necessities of life, and have nothing among them that can be called a town; though we find Anapocia, Dandar, and Czekorni, mentioned in the maps. They have the name of Christians; but have nothing left but the name, any more than the Mingrelians their northern neighbours. The men are robust and active, and the women are fair and beautiful; on which account the Turks have a great value for the female slaves, whom they purchase from among them. Their customs are more the same as those of the Mingrelians. E. Long. from 39 to 43. Lat. from 43 to 45.

ABASKAJA, a town of Siberia, on the river Iſchim. The church is surrounded by a rampart and palisades, and garrisoned by dragoons. Long. 69. 5. E. Lat. 50. 10. N.

ABATEMENT, in law. See TO ABATE.

ABATEMENT, in the customs, an allowance made upon the duty of goods, when the quantum damaged is determined by the judgment of two merchants upon oath, and ascertained by a certificate from the surveyor and land-waiter.

ABATIS, or ABATTIS, is, in military language, the name of a kind of entrenchment made of felled trees. When the emergency is sudden, the trees are merely laid lengthwise beside each other, with their branches pointed towards the enemy, to prevent his approach, whilst the trunks serve as a breastwork before those by whom the abatis is raised. When the abatis is meant for the defence of a pass or entrance, the boughs of the trees are generally stripped of their leaves and pointed; the trunks are planted in the ground; and the boughs are interwoven with each other. It is needless to add, that the closer the trees are laid or planted together, the more secure is the defence which they afford; and if, when they are planted, a small ditch be dug towards the enemy, and the earth thrown up properly against the lower part of the abatis, it will be very difficult to pass it if well defended.

ABATOR, in law, a term applied to a person who enters to a house or lands, void by the death of the last possessor, before the true heir.

ABATOS, an island in the lake Meiris, formerly famous for its flax and papyrus. It was the burial-place of Osiris, (Lucan.)

ABBADIE (James), an eminent Protestant divine, born at Nay in Bern, in 1654; first educated there under the famous John la Placette, and afterwards at the university of Sedan. From thence he went into Holland and Germany, and was minister in the French church of Berlin. He left that place in 1690; came into England; was some time minister in the French church in the Savoy, London; and was made dean of Killaloe in Ireland. He died at St. Mary le Bonne, near London, in 1727, aged 73. He was strongly attached to the cause of King William as appears in his el-

torate defence of the revolution, and his history of the assassination-plot. He had great natural abilities, which he improved by true and useful learning. He was a most zealous defender of the primitive doctrine of the Protestants, as appears by his writings; and that strong nervous eloquence, for which he was so remarkable, enabled him to enforce the doctrines of his profession from the pulpit with great spirit and energy. He published several works in French that were much esteemed; the principal of which are, *A Treatise on the Truth of the Christian Religion*; *The Art of knowing one's Self*; *A Defence of the British Nation*; and, *The History of the last Conspiracy in England*, written by order of King William III.

ABBAS, son of Abdalmothleb, and Mahomet's uncle, opposed his nephew with all his power, esteeming him an impious and infidel; but in the second year of the Hegira, being overcome and made a prisoner at the battle of Bendir, in 623, a great ransom being demanded for him, he represented to Mahomet, that his paying it would reduce him to poverty, which would redound to the dishonour of the family. But Mahomet having been informed of Abbas's having secreted large sums of money, asked him after the purses of gold he had left in his mother's custody at Mecca. Abbas, upon this, conceiving him to be really a prophet, embraced his new religion; became one of his principal captains; and saved his life when in imminent danger at the battle of Hainin, against the Thakefites, soon after the reduction of Mecca. But besides being a great commander, Abbas was a famous doctor of the Mussulman law, inasmuch that he read lectures upon every chapter of the Koran, as his nephew pretended to receive them one by one from heaven. He died in 652, and his memory is held in the highest veneration among the Mussulmans to this day.

Abul ABBAS, surnamed *Saffah*, was proclaimed khalif; and in him began the Dynasty of the

ABBASSIDES, who possessed the khalifate for 524 years; and there were 37 khalifs of this race who succeeded one another without interruption.

MILTON-ABBEY, a town of England, in the county of Dorset, so called on account of an abbey founded there by King Athelstan, said to be on account of the murder of his brother Edwin. This abbey, at the dissolution, was preserved entire by Sir John Tregonwell. In the year 1771, the whole, except the great hall, was taken down by Lord Milton. It has a weekly market on Tuesday. Eight miles S.W. of Blandford, and 112 W.S.W. of London.

ABBOT (George), Archbishop of Canterbury, was born October 29, 1562, at Guildford in Surrey. He went through his studies at Oxford, and in 1597 was chosen principal of University College. In 1599 he was installed dean of Winchester: the year following he was chosen vice-chancellor of the university of Oxford, and a second time in 1603. In 1604, that translation of the Bible now in use was begun by the direction of King James; and Dr. Abbot was the second of eight divines of Oxford, to whom the care of translating the whole New Testament (excepting the epistles) was committed. The year following, he was a third time vice-chancellor. In 1608 he went to Scotland with George Hume, earl of Dunbar, to assist in establishing an union betwixt the kirk of Scotland and the church of England; and in this affair he behaved with so much address and moderation, that it laid the foundation of all his future preferment. For King James ever after paid great deference to his advice and counsel; and upon the death of Dr. Overton, bishop of Lichfield and Coventry, he named Dr. Abbot for his successor, who was accordingly consecrated bishop of those two united sees in December 1609. About a month afterwards he was trans-

lated to the see of London; and on the second of November thereafter was raised to the archiepiscopal see. His great zeal for the Protestant religion made him a strenuous promoter of the match between the Elector Palatine and the Princess Elizabeth; which was accordingly concluded and solemnized the 14th of February, 1612, the archbishop performing the ceremony on a stage erected in the royal chapel. - In the following year happened the famous case of divorce betwixt the Lady Francis Howard, daughter of the Earl of Suffolk, and Robert earl of Essex: an affair which has been by many considered as one of the greatest blemishes of King James's reign; but the part acted therein by the archbishop, added much to the reputation he had already acquired for incorruptible integrity. The matter was by the king referred to a court of delegates. The archbishop saw plainly, that his majesty was very desirous the lady should be divorced; but he was, in his own judgment, directly against the divorce. He laboured all he could to extricate himself from this difficulty, by having an end put to the cause by some other way than by sentence: but it was to no purpose; for those who drove on this affair, had got too great power to be refrained from bringing it to the conclusion the king desired. The archbishop prepared a speech, which he intended to have spoken against the nullity of the marriage, in the court at Lambeth: but he did not make use of it, because the king ordered the opinions to be given in few words. He continued, however, inflexible in his opinion against the divorce; and drew up his reasons, which the king thought fit to answer himself. It need scarce be added, that sentence was given in the lady's favour. - In 1618, the king published a declaration, which he ordered to be read in all churches, permitting sports and pastimes on the Lord's day: this gave great uneasiness to the archbishop; who, happening to be at Croydon when it came thither, had the courage to forbid its being read. - Being now in a declining state of health, the archbishop used in the summer to go to Hamphire for the sake of recreation; and being invited by Lord Zouch to hunt in his park at Bramzill, he met there with the greatest misfortune that ever befel him; for he accidentally killed the game-keeper, by an arrow from a cross-bow which he shot at one of the deer. This accident threw him into a deep melancholy; and he ever afterwards kept a monthly fast on Tuesday, the day on which this fatal mischance happened, and he settled an annuity of 20l. on the widow. There were several persons who took an advantage of this misfortune, to lessen him in the king's favour; but his majesty said, "An angel might have miscarried in this sort." His enemies alleging that he had incurred an irregularity, and was thereby incapacitated for performing the offices of a primate; the king directed a commission to ten persons to enquire into this matter. The result, however, was not satisfactory to his Grace's enemies; it being declared, that, as the murder was involuntary, he had not forfeited his archiepiscopal character. The archbishop thenceforward seldom assisted at the council, being chiefly hindered by his infirmities; but in the king's last illness he was sent for, and attended with great constancy till his Majesty expired on the 27th of March, 1625. He performed the ceremony of the coronation of King Charles I. though very infirm and much troubled with the gout. He was never greatly in this king's favour; and the Duke of Buckingham being his declared enemy, watched an opportunity of making him feel the weight of his displeasure. This he at last accomplished, upon the archbishop's refusing to license a sermon, preached by Dr. Sibthorpe, to justify a loan which the king had demanded, and pregnant with principles which tended to overthrow the constitution. The archbishop was immediately suspended from all his functions as primate; and they were exercised by certain bishops commissioned by

the king, of whom Laud, the archbishop's enemy, and afterwards his successor, was one : while the only cause assigned for this procedure was, that the archbishop could not at that time personally attend those services, which were otherwise proper for his cognisance and direction. He did not, however, remain long in this situation ; for a parliament being absolutely necessary, his Grace was sent for, and restored to his authority and jurisdiction. But not proving friendly to certain rigorous measures adopted by the prevailing church-party, headed by Laud, whose power and interest at court was now very considerable, his presence became unwelcome there ; so that upon the birth of the Prince of Wales, afterwards Charles II. Laud had the honour to baptize him, as dean of the chapel. The archbishop, being worn out with cares and infirmities, died at Croydon, the 6th of August, 1633, aged seventy-one years ; and was buried at Guildford, the place of his nativity, and where he had endowed an hospital with lands to the amount of 300*l.* per annum. A stately monument was erected over the grave, with the effigy of the archbishop in his robes. He shewed himself, in most circumstances of his life, a man of great moderation to all parties ; and was desirous that the clergy should attract the esteem of the laity, by the sanctity of their manners, rather than claim it as due to their function. His notions and principles, however, not suiting the humour of some writers, have drawn upon him many severe reflections ; particularly, which is to be regretted, from the Earl of Clarendon. But Dr. Welwood has done more justice to his merit and abilities. He wrote several tracts upon various subjects ; and, as already mentioned, translated part of the New Testament, with the rest of the Oxford divines, 1611.

ABBOTS LANGLEY, a village of England, in the county of Hertford, the birth place of Nicholas Brakspear, afterwards Pope Adrian IV. Four miles S.W. from St. Albans.

ABBOTSBURY, a town of England, in the county of Dorset, near the sea ; it received its name from a celebrated abbot there, before the reformation : 75 miles from Dorchester, and 127 W. London.

ABBREVIATION OF FRACTIONS, in arithmetic and algebra, is the reducing of them to lower terms ; which is done by dividing the numerator and denominator by some number or quantity which will divide both without leaving a remainder either.

ABBUTALS (*Encycl.*) signify the buttings or boundings of land towards any point. Limits were anciently distinguished by artificial hillocks, which were called *butentines* ; and hence *butting*. In a description of the site of land, the sides on the breadth are more properly *adjacentes*, and those terminating the length are *abbutantes* ; which, in old surveys, were sometimes expressed by *capitare*, to head, whence abbutals are now called *head-lands*.

ABDALA, the son of Abdalmothleb, was the father of the prophet Mahomet.

ABDALMALEK, the son of Mirvan, and the 5th khelif of the race of the Omniads, surnamed *Kajsh al Hegarat*, i. e. the skinner of a stone, because of his extreme avarice ; as also *Aboulzebab*, because his breath was said to be so poisonous as to kill all the flies which rested on his face. Yet he surpassed all his predecessors in power and dominion ; for in his reign the Indies were conquered in the east, and his armies penetrated Spain in the west : he likewise extended his empire toward the south, by making himself master of Medina and Mecca. He began his reign in the 65 of the Hegira, A.D. 648 ; reigned 15 years ; and four of his sons enjoyed the khalfate one after another.

ABDALMELEK (Ben Zohar), an eminent physician, commonly called by the Europeans *Atenzour*.

ABDALMOTHLEB, or **ABDAL MATELEB**, the son of Hafsem, the father of Abdalla, and grandfather of Mahomet, the prophet of the Mussulmans, was, it is said, of such wonderful comeliness and beauty, that all women who saw him became enamoured : which may have given occasion to that prophetic light, which, according to the Arabians, shone on the foreheads of him, his ancestors, and descendants ; it being certain that they were very handsome and graceful men. He died when Mahomet, of whom he had taken peculiar care, was only eight or nine years old ; aged, according to some, 110, and according to other writers 120.

ABDALONYMUS, or **ABDOLONYMUS** (in classic history), of the royal family of Sidon, and descended from King Cinyras, was contented to live in obscurity, and get his subsistence by cultivating a garden, while Strato was in possession of the crown of Sidon. Alexander the Great having deposed Strato, enquired whether any of the race of Cinyras was living, that he might set him on the throne. It was generally thought that the whole race was extinct : but at last Abdalonymus was thought of, and mentioned to Alexander : who immediately ordered some of his soldiers to fetch him. They found the good man at work, happy in his poverty, and entirely a stranger to the noise of arms, with which all Asia was at that time disturbed ; and they could scarcely persuade him that they were in earnest. Alexander was convinced of his high descent, by the dignity that appeared in his person ; but was desirous of learning from him in what manner he bore his poverty. " I wish (said Abdalonymus) I may bear my new condition as well : these hands have supplied my necessities ; " I have had nothing, and I have wanted nothing." This answer pleased Alexander so much, that, besides giving him all that was Strato's, he augmented his dominions, and gave him a large present out of the Persian spoils.

ABDERA, a maritime town of Thrace, not far from the mouth of the river Nessus, on the east side. (Strabo.) The foundation thereof, according to Herodotus, was attempted to be laid by Timæus, the Clazomenian ; but he was forced by the Thracians to quit the design. The Teians undertook it, and succeeded ; settling there, in order to avoid the insults of the Persians. Several singularities are told of Abdera by historians.

ABDIAS, of Babylon, one of the boldest legend writers, who boasted he had seen our Saviour, was one of the 72 disciples, had been eye-witness of the actions and prayers at the deaths of several of the apostles, and had followed into Persia St. Simon and St. Jude, who, he said, made him the first bishop of Babylon. His book, entitled *Historia certaminis Apostolorum*, was published by Wolfgang Lazius, at Basil, 1551 ; and it has since borne several impressions in different places.

ABDON, one of the Levitical cities in the south, of the tribe of Asher. (Joshua.)

ABDON, the son of Hillel, a Pirathonite, succeeded Flon, and judged Israel eight years.

ABELARD (*Encycl.*), one of the most famous doctors of the twelfth century, was born at Palais, near Nantz, in Brittany : he was well learned in divinity, philosophy, and the languages ; but was particularly distinguished by his skill in logic, and his fondness for disputations, which led him to travel into several provinces in order to give public proof of his acuteness in that science. After having baffled many antagonists, he read lectures in divinity with great applause at Paris ; where he boarded with a canon, whose name was Fulbert, and who had a very beautiful niece named Heloise. The canon ardently wished to see this young lady make a figure among the learned, and Abelard was made her preceptor ; but instead of instructing her in the sciences, he taught her to love. Abelard now performed his public functions very

coldly, and wrote nothing but amorous verses. Heloise proving with child, Abelard lent her to a sister of his in Brittany, where she was delivered of a son. To soften the canon's anger, he offered to marry Heloise privately; and he was better pleased with the proposal than the niece; who, from a singular excess of passion, chose to be his mistress rather than his wife. She married, however; but used often to protest upon oath that she was single, which provoked the canon to use her ill. Upon this, Abelard sent her to the monastery of Argenteuil; where she put on a religious habit, but did not take the veil. Heloise's relations considering this as a second treachery, hired ruffians, who, forcing into his chamber in the dead of the night, encafeulated him. This infamous treatment made him fly to the gloom of a cloister. He assumed the monastic habit in the abbey of St. Denis; but the disorders of that house soon drove him from thence. He was afterwards charged with heresy; but after several persecutions for his religious sentiments, he settled in a solitude in the diocese of Troyes, where he built an oratory, to which he gave the name of the Paraclete. He was afterwards chosen superior of the abbey of Ruis, in the diocese of Vannes: when the nuns being expelled from the nunnery in which Heloise had been placed, he gave her his oratory; where he settled with some of her sister nuns, and became their prior. Abelard mixed the philosophy of Aristotle with his divinity, and in 1140 was condemned by the council of Rheims and Sens. Pope Innocent II. ordered him to be imprisoned, his books to be burnt, and forbade him ever teaching again. However, he was soon after pardoned, at the solicitation of Peter the Venerable, who received him into his abbey of Clugny, where he led an exemplary life. He died in the priory of Marcellus at Chalons, April 21, 1142, aged sixty-three. His corpse was sent to Heloise, who buried it in the Paraclete. He left several works: the most celebrated of which are those tender letters that passed between him and Heloise, with the account of their misfortunes prefixed; which have been translated into English, and one of them immortalized by the harmony of Mr. Pope's numbers.

ABEL-BETH-MAACHA, called also *Abel-maim*, a town in the tribe of Naphthali, in the north of Canaan, towards Syria, where was a district called Maacha. (1 Kings xv. 2 Chron. xvi.)

ABELLA, anciently a town of Campania, near the river Clanius. The inhabitants were called Abellani, and said to have been a colony of Chalcidians. The nux Avellana, called also Prænestina, or the hazel-nut, takes its name from this town, according to Macrobius. Now *Avella*.

ABELLINUM, anciently a town of the Hirpini, a people of Apulia: distant about a mile from the rivulet Sabbato, between Beneventum and Salernum. Pliny calls the inhabitants Abellinates, with the epithet Protopi, to distinguish them from the Abellinates Marii. Now *Avellino*. E. Long. 15. 20. Lat. 21.

ABEL-MEHOLA, the country of the prophet Elisha, situate in Manasseh, on this side Jordan, between the valley of Jezreel and the village Bethmaela in the plains of Jordan, where the Midianites were defeated by Gideon. (Judges vii. 22.)

ABEL-MIZRAIM, called also the Threshing-floor of *Atad*; signifying the lamentation of the Egyptians; in allusion to the mourning for Jacob. (Gen. i. 3, 10, 11.) Supposed to be near Hebron. (Wells.)

ABEL-MOLUCH (*Encycl.*). See PALMA CHRISTI.

ABELMOSCH (*Encycl.*). See HIBISCUS.

ABEL-SATTIM, or SITTIM, a town in the plains of Moab, to the N. E. of the Dead Sea, not far from Jordan, where the Israelites committed fornication with the daughters

of Moab: so called, probably, from the great number of sitim-trees there.

ABENEZRA (Abraham), a celebrated rabbi, born at Toledo in Spain, called by the Jews, the wife, great, and admirable Doctor, was a very able interpreter of the Holy Scriptures; and was well skilled in grammar, poetry, philosophy, astronomy, and medicine. He was also a perfect master of the Arabic. His principal work is, Commentaries on the Old Testament, which is much esteemed: these are printed in Bomberg's and Buxtorf's Hebrew Bibles. His style is clear, elegant, concise, and much like that of the Holy Scriptures: he almost always adheres to the literal sense, and everywhere gives proofs of his genius and good sense: he, however, advances some erroneous sentiments. The fear of all his books is entitled, *Jesud Mora*; which is a theological work, intended as an exhortation to the study of the Talmud. He died in 1174, aged 75.

ABEN MELLER, a learned rabbin, who wrote a Commentary on the Old Testament in Hebrew, entitled, *The Perfection of Beauty*. This rabbin generally follows the grammatical sense and the opinions of Kimchi. The best edition is that of Holland.

ABENOW, in geometry. See ABNOZA.

ABENRADE, a seaport town of Denmark, in the duchy of Sleswick, situated at the bottom of a bay, surrounded with hills which form a good harbour, deep and secure. The inhabitants are much employed in fishing: it is besides a place of considerable trade. Long. 27. 52. E. Lat. 54. 50. N.

ABERNETHY, a town in Strathern, a district of Perthshire, in Scotland. It is seated on the river Tay, a little above the mouth of the Erne. It is said to have been the seat of the Pictish kings; and was afterwards the see of an archbishop, since transferred to St. Andrews. It is now greatly decayed.

ABERRATION of the *visual ray* (*Encycl.*). See the articles ABERRATION and ASTRONOMY. Dr. Hutton explains this in the following satisfactory way:

"This effect (says he) may be explained and familiarized by the motion of a line parallel to itself, much after the manner that the composition and resolution of forces are explained. If light have a progressive motion, let the proportion of its velocity to that of the earth in her orbit be as the line BC (Plate 11. fig. 1.) to the line AC; then, by the composition of these two motions, the particle of light will seem to describe the line BA or DC, instead of its real course BC; and will appear in the direction AB or CD, instead of its true direction CB. So that if AB represent a tube, carried with a parallel motion by an observer along the line AC, in the time that a particle of light would move over the space BC, the different places of the tube being AB, ab, cd, CD; and when the eye, or end of the tube, is at A, let a particle of light enter the other end at B; then when the tube is at ab, the particle of light will be at e, exactly in the axis of the tube; and when the tube is at cd, the particle of light will arrive at f, still in the axis of the tube; and, lastly, when the tube arrives at CD, the particle of light will arrive at the eye or point C, and consequently will appear to come in the direction DC of the tube, instead of the true direction BC: and so on, one particle succeeding another, and forming a continued stream or ray of light in the apparent direction DC. So that the apparent angle made by the ray of light with the line AE is the angle DCE, instead of the true angle BCE; and the difference BCD, or ABC, is the quantity of the aberration."

ABERRATION of the Planets, is equal to: their geocentric motion, or, in other words, to the space which each appears to move as seen from the earth, during the time that light employs in passing from the planet to the eye of the observer.

Thus the sun's aberration in longitude is constantly $20''$, that being the space actually moved by the earth; but apparently by the sun in 8 minutes and 7 seconds, the time in which light passes from the sun to the earth. If then the distance of any planet from the earth be known, the time which light employs in passing from the planet to the earth must likewise be known; for as the distance of the sun is to the distance of the planet, so is 8 minutes and 7 seconds to that time; and the planet's geocentric motion in that time is its aberration, whether it be in longitude, latitude, right ascension, or declination. See *ASTRONOMY*.

ABERRATION (*Encycl.*), in astronomy, a small apparent motion of the fixed stars discovered by the late Dr. Bradley. The discovery was made by accident in the year 1725, when Mr. Molyneux and Dr. Bradley began to observe the bright star in the head of *Draco*, marked γ by Bayer, as it passed near the zenith, with an instrument made by Mr. Graham, in order to discover the parallax of the earth's annual orbit; and, after repeated observations, they found this star, about the beginning of March, 1726, to be $20''$ more southerly than at the time of the first observation. It now indeed seemed to have arrived at its utmost limit southward; because, in several trials made about this time, no sensible difference was observed in its situation. By the middle of April, it appeared to be returning back again toward the north; and, about the beginning of June, it passed at the same distance from the zenith as it had done in December, when it was first observed: in September following it appeared $39''$ more northerly than it was in March, just the contrary way to what it ought to appear by the annual parallax of the stars. This unexpected phenomenon perplexed the observers very much; and Mr. Molyneux died before the true cause of it was discovered. After this, Dr. Bradley, with another instrument more exact, and accurately adapted to this purpose, observed the same appearances not only in that but many other stars: and, by the great regularity that appeared in a series of observations made in all parts of the year, the doctor was fully satisfied with regard to the general laws of the phenomena; and therefore endeavoured to find out the cause of them. He was already convinced, that the apparent motion of the stars was not owing to a nutation of the earth's axis. The next thing that offered itself, was an alteration in the direction of the plumb line, with which the instrument was constantly rectified; but this, upon trial, proved insufficient. Then he had recourse to what refraction might do; but here also nothing satisfactory occurred. At last this acute astronomer found, that the phenomena in question proceeded from the progressive motion of light, and the earth's annual motion in its orbit: for he perceived, that if light was propagated in time, the apparent place of a fixed object would not be the same when the eye is at rest, as when it is moving in any other direction, than that of the line passing through the eye and object; and that, when the eye is moving in different directions, the apparent place of the object would be different.—*Vide Phil. Transf.* N^o. 406.

ABEX (*Encycl.*), a country in High Ethiopia, in Africa, bordering on the Red Sea, by which it is bounded on the east. It has Nubia or Sennar on the north; Sennar and Abyssinia on the west; and Abyssinia on the south. Its principal towns are Suaqueim and Arkeko. It is subject to the Turks, and has the name of Beglerbeg of Habeleth. It is about five hundred miles in length and one hundred in breadth, and is a wretched country; for the heat here is almost insupportable, and the air is so unhealthy, that an European cannot stay long there without the utmost hazard of his life. It is very mountainous, inasmuch that there are many more wild beasts than men. There are forests, in which grow a great number of ebony trees.

ABGAR, or **ABGARUS**, a name given to several of the kings of Edessa in Syria. The most celebrated of them is one who, it is said, was contemporary with Jesus Christ; and who having a distemper in his feet, and hearing of Jesus's miraculous cures, requested him, by letter, to come and cure him. Eusebius, who believed that this letter was genuine, and also an answer our Saviour is said to have returned to it, has translated them both from the Syriac, and asserts, that they were taken out of the archives of the city of Edessa.—After Jesus's ascension, Judas, who is also named Thomas, sent Thaddæus, one of the seventy, to Abgarus; who preached the gospel to him and his people, cured him of his disorder, and wrought many other miracles: this was done, says Eusebius, A. D. 43.—Though the letters are acknowledged to be spurious by the candid writers of the church of Rome; several protestant authors, as Dr. Parker, Dr. Cave, and Dr. Grabe, have maintained that they are genuine, and ought not to be rejected.

ABGILLUS (*Encycl.*), attended Charlemagne in his expedition to the Holy Land; but instead of returning with that monarch to Europe, it is pretended that he gained mighty conquests, and founded the empire of the Abyssinians, called, from his name, the empire of Prester John. He is said to have written the history of Charlemagne's journey into the Holy Land, and of his own into the Indies; but they are more probably trifling romances, written in the ages of ignorance.

ABHEL (*Encycl.*). See *JUNIPERUS*.

ABIAD, a town of Africa, on the coast of Abex, seated on a high mountain, and remarkable for its trade in ebony and aromatic plants.

ABIAGRASSO, a small town of Italy, seated on a canal, in the duchy of Milan. Long. 9. 24. E. Lat. 45. 20. N.

ABIANS, anciently a people of Thrace, or (according to some authors) of Scythia. They had no fixed habitations; they led a wandering life. Their houses were waggon, which carried all their possessions. They lived on the flesh of their herds and flocks, on milk, and cheese, chiefly on that of mares' milk. They were unacquainted with commerce: they only exchanged commodities with their neighbours. They possessed lands; but they did not cultivate them. They assigned their agriculture to any who would undertake it, reserving only to themselves a tribute; which they exacted, not with a view to live in affluence, but merely to enjoy the necessaries of life. They never took arms but to oblige those to make good a promise to them by whom it had been broken. They paid tribute to none of the neighbouring states. They deemed themselves exempt from such an imposition; for they relied on their strength and courage, and consequently thought themselves able to repel any invasion. The Abians, we are told, were a people of great integrity. This honourable eulogium is given them by Homer. (Strabo.)

ABIATHAR, high-priest of the Jews, son to Abimelech, who had borne the same office, and received David into his house. This so enraged Saul, who hated David, that he put Abimelech to death, and eighty-one priests; Abiathar alone escaped the massacre. He afterwards was high-priest; and often gave King David testimonies of his fidelity, particularly during Abiathar's conspiracy, at which time Abiathar followed David, and bore away the ark. But after this, conspiring with Adonijah, in order to raise him to the throne of King David his father; this so exasperated Solomon against him, that he dethroned him of the priesthood, and banished him, A. M. 3021, before Christ 1014.

ABIHU, brother to Nadab, and son to Aaron. The two former had the happiness to ascend mount Sinai with their father, and there to behold the glory of God: but afterward putting strange fire into their censers, instead of the sacred fire commanded by God, fire rushing upon them killed them.

Though all the people bewailed this terrible catastrophe, Moses forbade Aaron and his two sons, Eleazar and Ithamar, to join in the lamentation.

ABILITY, a term in law, denoting a power of doing certain actions in the acquisition or transferring of property.

ABIMELECH, king of Gerar, a country of the Philistines, contemporary with Abraham. This patriarch and his family being there, his wife Sarah, though 90 years of age, was not safe in it; for Abimelech carried her off, and was so enamoured of her, that he resolved to marry her. Abraham did not declare himself Sarah's husband; but gave out she was his sister. But the king being warned in a dream that she was married to a prophet, and that he should die if he did not restore her to Abraham, the king obeyed: at the same time reproving Abraham for his duplicity; who thereupon, among other excuses, said she was really his sister, being born of the same father, though of a different mother. Abimelech afterwards gave considerable presents to Abraham; and a covenant, that of Beer-sheba, was entered into between them. After the death of Abraham, there being a famine in the neighbouring countries, Isaac his son also withdrew into Gerar, which was at that time likewise governed by a king called Abimelech.

ABIMELECH, probably the successor of the former. Here Rebekah's beauty forced her husband to employ Abraham's artifice. Abimelech discovering that they were nearer related, chid Isaac for calling his wife his sister; and, at the same time, forbade all his subjects, upon pain of death, to do the least injury to Isaac or Rebekah.—Isaac's prosperity lost him the king's friendship, and he was desired to go from among them. He obeyed; but Abimelech afterward entered into a covenant with him.

ABIMELECH, the natural son of Gideon, by Druma his concubine. His violent acts and death are recorded in Judges, chap. ix.

ABIRAM, a seditious Levite, who, in concert with Korah and Dathan, rebelled against Moses and Aaron, in order to share with them in the government of the people; when Moses ordering them to come with their censers before the altar of the Lord, the earth suddenly opened under their feet, and swallowed up them and their tents; and at the same instant fire came from heaven, and consumed two hundred and fifty of their followers. Numb. xvi.

ABISHAI, son of Zeruiah, and brother to Joab, was one of the celebrated warriors who flourished in the reign of David; he killed with his own hand three hundred men, with no other weapon but his lance; and slew a Philistine giant, the iron of whose spear weighed three hundred shekels.—1 Sam. xvi. 2 Sam. xliii.

ABKHAS, one of the seven nations in the countries comprehended between the Black Sea and the Caspian. Their principal and most ancient establishments are on the southern slope of the mountains comprehended between the river Cuban and the Black Sea. They are tributary to the Turks, and are divided into two governments, the western and the eastern; each subject to a bathwa, commonly chosen out of the principal native families; one of whom resides at Sotchukkalé, and the other at Soghukmalé. The capital is Anacopir, formerly Nicopsis. The Abkhas speak an original language, essentially different from all the known languages, though appearing to have a remote affinity to that of the Circassians. They have, at present, very little religion, although they still preserve some traces of Christianity.

ABLACTATION, in the ancient agriculture, is a method of engrafting; wherein the cyon of one tree, being united for some time to the stock of another, is afterwards cut off, and, as it were, weaned from its mother-tree. Ablactation is only

practicable where the stock to be grafted on, and the tree from which the graft is to be taken, stand so near, that the branch or cyon may be applied without cutting off. Hence it is chiefly used on plants that grow in cafes; as orange, lemon, and pomegranate trees; vines, jalmains, &c. The season is April or May. To perform it, the usual method is, to take the branch intended for the graft, and pare it away, both the rind and wood, through the length of three inches; then paring likewise the stock, so that they may join closely to each other, they are bound together, and covered over with clay or grafting-wax. As soon as they are found well incorporated together, the head of the stock is to be cut off four inches above the binding; and the spring following, the graft, leaving the stock to subsist by itself. Or, the operation may be done by cutting off the head of the stock at first, and leaving the top a little sloped, and applying the graft thereto, as in shoulder-grafting. But this method is not found equally successful.

ABLATIVE ABSOLUTE, in grammar, is a word or phrase detached and independent of the rest of the discourse; neither governing, nor being governed of any other thing. This is frequent among the Latins; in imitation of whom the modern languages have likewise adopted it.

ABLE or **ABEL** (Thomas), was admitted B.A. at Oxford, July 4, 1513, and took his degrees of M. A. June 26, 1516. He was afterwards appointed chaplain to Queen Catherine, wife to King Henry VIII. Mr. Bouchier thus speaks of him: "Vir longe doctissimus, qui reginæ aliquando in musicarum tactu & linguis operam suam navaret!"—A man of great learning, who used sometimes to teach the queen music and the languages. He greatly distinguished himself by opposing the divorce of the queen, and was a violent enemy to the king in all his unlawful proceedings. He wrote a treatise, "De non dissolvendo Henrici & Catherinæ matrimonio." In the year 1534 he was attainted of misprision, for taking part and being active in the affair of Elizabeth Barton, the holy maid of Kent, as she was called. He was afterwards sentenced to die for denying the king's supremacy, and was accordingly executed July 30, 1540. It is thought that he wrote several pieces; but they have been lost. When in prison he was confined very closely; and the keeper of Newgate was once sent to the Marshalsea for allowing him and Dr. Powell to go out upon bail.

ABLOE, a town of Little Tartary, lying between the river Dnieper, and the Black Sea. E. long. 35. 15. N. lat. 46. 20.

ABNAKIS, Indians of North America, between New England and Canada. They have labour, and could never be brought to cultivate the ground.

ABNER, the son of Ner, father-in-law to Saul, and general of all his forces, who served him on all occasions with fidelity and courage. After the death of that prince, Abner set Ishboeth, Saul's son, on the throne. A war breaking out between the tribe of Judah, who had elected David king, and Israel, Abner marched against that prince with the flower of his troops, but was defeated. Abner afterward, being disguised, went over to David, and disposed the chiefs of the army and the elders of Israel to declare for him; and was received by David with such testimonies of affection, as gave umbrage to Joab, who killed him traitorously.

ABO (*Encycl.*), is the capital of the province of Finland, and is seated in the gulph of that name, at the mouth of the river Aurajoki. It has a good port; and is the see of a bishop, suffragan of Upsal. It has also an university, founded by Queen Christina in 1640.

ABOAB, cesses levied in India, under different denominations, beyond the standard rent.

ABO-FLOT, or **ABO-MUS**, an ancient fort in Finland, on a peninsula, near the mouth of the river Aura. It has often suffered from the enemy and by fire.

ABOARD (*Encycl.*), the inside of a ship. When an enemy enters in the time of battle, he is said to *board*; a phrase which always implies hostility. To *fall a-board of*, is to strike or encounter another ship when one or both are in motion, or to be driven upon a ship by the force of wind or current. *Aboard-main-tack*, the order to draw the main-tack, i. e. the lower corner of the main-sail, down to the chief-tree. See **CURSTREE**.

ABOMINATION, a term used in scripture with regard to the Hebrews, who, being shepherds, are said to have been an abomination to the Egyptians, because they sacrificed the sacred animals of that people, as oxen, goats, sheep, &c. which the Egyptians esteemed as abominations, or things unlawful. The term is also applied in the sacred writings to idolatry and idols, because the worship of idols is in itself an abominable thing, and at the same time ceremonies observed by idolaters were always attended with licentiousness and other odious and abominable actions. The *abomination of desolation*, foretold by the prophet Daniel, is supposed to imply the statue of Jupiter Olympius, which Antiochus Epiphanes caused to be placed in the temple of Jerusalem. And the *abomination of desolation*, mentioned by the Evangelists, signifies the ensigns of the Romans, during the last siege of Jerusalem by Titus, on whom the figures of their gods and emperors were embroidered, and placed upon the temple after it was taken.

ABON, **ABONA**, or **ABONIS** (Antonine); a town and river of Albion. The town, according to Camden, is Abington; and the river Abhon or Avon. But by Antonine's Itinerary, the distance is nine miles from the Venta Silurum, or Caer-Went: others, therefore, take the town to be Porstut, at the mouth of the river Avon, over against Bristol. Abhon or Avon, in the Celtic language, denotes a river.

ABOR, **CHABOR**, or **HABOR**, a district in Assyria on the river Gozan, bounding on Media, 2 Kings xviii.

ABOU-NAVAS, an Arabian poet of the first class, was born at Balisra; and flourished at the court of Aaron al Raschid, at the end of the 7th century.

ABRABANEL, **ABAREANEL**, or **AVRANVEL** (Isaac), a celebrated rabbi, descended from King David, and born at Lisbon, A.D. 1437. He became counsellor to Alphonso V. king of Portugal, and afterwards to Ferdinand the Catholic; but in 1492 was obliged to leave Spain with the other Jews. In short, after residing at Naples, Corfu, and several other cities, he died at Venice in 1508, aged 71. Abrabanel passed for one of the most learned of the rabbis; and the Jews gave him the name of the Sage, the Prince, and the Great Politician. We have a Commentary of his on all the Old Testament, which is pretty scarce: he there principally adheres to the literal sense; and his style is clear, but a little diffuse. His other works are, A Treatise on the Creation of the World; in which he refutes Aristotle, who imagined that the world was eternal: A Treatise on the Explication of the Prophecies relating to the Messiah, against the Christians: a book concerning articles of Faith; and some others less sought after. Though Abrabanel discovers his aversion to Christianity, yet in all his writings he treats the Christians with politeness and good manners.

ABRAHAM, the father and stock whence the faithful sprung, was the son of Terah. He was descended from Noah by Shem, from whom he was nine degrees removed. Some fix his birth in the 130th year of Terah's age, but others place it in his father's 70th year. It is highly probable he was born in the city of Ur, in Chaldea, which he and his father left

when they went to Canaan, where they remained till the death of Terah; after which, Abraham resumed his first design of going to Palestine. The Scriptures mention the several particulars of his life, which it would be of little use to dwell long upon. Tradition also has supplied numberless others, respecting his conversion from idolatry. Abraham is said to have been well skilled in many sciences, and to have wrote several books. Josephus tells us that he taught the Egyptians arithmetic and geometry; and, according to Eupolemus and Artapan, he instructed the Phoenicians, as well as the Egyptians, in astronomy. A work which treats of the Creation has been long ascribed to him: it is mentioned in the Talmud, and the Rabbis Chanina and Hofchaia used to read it on the eve before the sabbath. In the first ages of Christianity, according to St. Epiphanius, an heretical sect, called Sethinians, dispersed a piece which had the title of *Abraham's Revelation*. Origen mentions also a treatise supposed to be wrote by this patriarch. All the several works which Abraham composed in the plains of Mamre, are said to be contained in the library of the monastery of the Holy Cross on Mount Amaria, in Ethiopia. The book on the Creation was printed at Paris 1552, and translated into Latin by Poffel: Rittangel, a converted Jew, and professor at Konigberg, gave also a Latin translation of it, with remarks, in 1642. Abraham died at the age of 175.

ABRAHAM BEN MEIR, or **ABEN EZRA**. See **ABEN EZRA**. **ABRAHAM USQUE**, a Portuguese Jew, who translated the Bible out of Hebrew into Spanish. It was printed at Ferrara in 1553, and reprinted in Holland in 1630. This Bible, especially the first edition, which is most valuable, is marked with stars at certain words, which are designed to shew that these words are difficult to be understood in the Hebrew, and that they may be used in a different sense.

ABRAHAM (Nicholas), a learned Jesuit, born in the diocese of Toul, in Lorraine, in 1589. He obtained the rank of divinity professor in the university of Pont-a-Mousson, which he enjoyed 17 years, and died September 7, 1655. He wrote Notes on Virgil and on Nonnius; A Commentary on some of Cicero's Orations, in 2 vols. folio. An excellent collection of theological pieces, in folio, entitled *Pharus Veteris Testamenti*; and some other works.

ABRAHAMSDORF, a small town of Hungary, but well inhabited. E. long. 19. 50. N. lat. 46. 20.

ACREIRO, a town of Tra-os-montes, in Portugal, in a district which comprehends ten parishes. W. long. 7. 10. N. lat. 41. 20.

ABRETTENE (Strabo); **ABRETTINE** (Stephanus); a district of Myria, in Asia. Hence the epithet *Abrettinus* given Jupiter (Strabo); whose priest was Cleon, formerly at the head of a gang of robbers, and who received many and great favours at the hand of Antony, but afterwards went over to Augustus. The people were called *Abrettini*; inhabiting the country between Ancyra of Phrygia, and the river Rhyndacus.

ABRODITICALL; delicate or nice in diet.

ABROTONUM, a town and harbour on the Mediterranean, in the district of Syrtis Parva, in Africa (Strabo, Pliny): one of the three cities that went to form Tripoly.

ABRUG-BANYA, a populous town in Transylvania, on the river Ompay, 35 miles above Alba Julia, near which are mines of gold and silver. E. long. 23. 24. N. lat. 46. 50.

ABRUZZO (*Encycl.*), a province in Naples. The river Pescara divides it into two parts; one of which is called *Uterior*, whereof Aquila is the capital; and the other *Citerior*, whose capital is Solomona. Besides the Appennines, there are two considerable mountains, the one called Monte Cavallo, and the other Monte Maiello. The top of this last is always covered with snow. Abruzzo is a cold but fruitful country;

and abounds with corn, rice, also several good fruits, and saffron.

ABISALOM, the son of David by Maacah, was brother to Thamar, David's daughter, who was ravished by Amnon, their eldest brother by another mother. He waited two years for an opportunity of revenging the injury done to his sister, and at last procured the assassination of Amnon, at a feast which he had prepared for the king's sons. He took refuge with Halmi king of Gethur; and was no sooner restored to favour, but he engaged the Israelites to revolt from his father. Abisalom was defeated in the wood of Ephraim: as he was flying, his hair caught hold of an oak, where he hung till Joab came and thrust him through with three darts: David had expressly ordered his life to be spared, and extremely lamented him.

ABSCEDENTIA, in surgery, a term applied to decayed parts of the body, which, in a morbid state, are separated from the found, or lose that union which was preserved in a natural state.

ABSCISS, **ABSCISSA**, or **ABSCISSE**, is a part cut off from a straight line, and terminated at some certain point by an ordinate to a curve; as AP (Pl. II. fig. 2.), or BP (fig. 3.). The absciss may commence either at the vertex of the curve, or at any other fixed point; and it may be taken either upon the axis or upon the diameter of the curve, or upon any other line drawn in a given position. Hence there are on the same given line, or diameter, an infinite number of variable abscisses, terminated all at one end by the same fixed point. In the common parabola (fig. 4.), each ordinate PQ has but one absciss AP. In the ellipse or circle (fig. 2.), the ordinate has two abscisses lying on the opposite sides of it. In general, to each ordinate a line of the second kind, or a curve of the first kind, may have two abscisses; a line of the third order, three; a line of the fourth order, four; and so on.

ABSCISSION, a figure in rhetoric, whereby the speaker stops short in the middle of his discourse, leaving the audience to make the inference.

ABSCISSION, in surgery, the same with amputation.

ABSOLUTE EQUATION (*Encycl.*), in astronomy. See **ASTRONOMY**.

ABSORUS, **APSORUS**, **ABSYRTIS**, **ABSYRTIDES**, **APSYRTIDES**, **APSYRTIS**, and **ABSYRTIUM** (*Encycl.*), (Strabo, Mela, Ptolemy); islands in the Adriatic; so called from Absyrtus, Medea's brother, there slain. They are either one island, or two, separated by a narrow channel, and joined by a bridge; and are now called *Cherso* and *Osero*.

ABSPERG, a small town in Suabia, in the Norgow, near Anspach.

ABSTEINEN, a bailiwick beyond the river Memel, in the circle of Tapien, belonging to the kingdom of Prussia. It is a mountainous, but pleasant country, and abounds in corn and cattle.

ABSTEMIUS (Laurentius), an Italian writer, born at Macerata, in La Marca de Ancona, who devoted himself early to the study of polite literature, and made a surprising progress therein. He taught the belles lettres at Urbino, where he was librarian to Duke Guido Ubaldo; to whom he dedicated a small piece, explaining some dark passages in the ancient authors. He published it under the pontificate of Alexander VI.; and another treatise also, entitled *Hecatomythium*, from its containing a hundred fables, which he inscribed to Octavian Ubal dini, count de Mercatelli. His Fables have been often printed with those of Æsop, Phædrus, Gubrias, Avienus, &c. He has these ancient mythologists generally in view, but does not always strictly follow their manner; sometimes intermixing his fable with a merry story, and now and then somewhat satirical upon the clergy. His 204th fable of the Talents Multiplied, is a proof of this. A

priest, as we are there told, was ordered by his bishop to superintend a monastery, where there were five nuns, by each of whom he had a son before the year was out. The bishop, hearing of this, was highly enraged; and, sending for the priest, reprimanded him severely, calling him a pernicious sacrilegious villain, for having thus defiled the temples of the Holy Ghost. "Lord," said the priest, "thou deliverest unto me five talents; behold I have gained, besides them, five talents more." The prelate was so taken with this facetious answer, that he gave the priest plenary absolution.

ABSURDUM, a term made use of by mathematicians when they demonstrate any truth, by showing that its contrary is impossible, or involves an absurdity. Thus, Euclid demonstrates the truth of the fourth proposition of the first book of his Elements, by showing that its contrary implies this obvious absurdity—"that two straight lines may inclose a space."—This mode of demonstration is called *reductio ad absurdum*, and is every whit as conclusive as the direct method; because the contrary of every falsehood must be truth, and of every truth, falsehood.

ABSYRTUS (*Encycl.*), in the heathen mythology, the son of Æta and Hypsea, and the brother of Medea. The latter running away with Jason, after her having assisted him in carrying off the golden fleece, was pursued by her father; when, to stop his progress, she tore Absyrtus in pieces, and scattered his limbs in his way.

ABUCARAS (Theodorus), metropolitan of Caria in the ninth century, was remarkable for his zeal in defending what he believed to be the truth, and was the author of above forty controversial treatises against the Saracens, Jews, and reputed heretics. This metropolitan at first embraced the doctrines of Photius; for which, begging pardon of the council of Constantinople in 869, he was restored to the communion of the church, and obtained a seat in the council. His works are inserted in the Supplement of the *Bibliothèque des Pères*, the Paris edition.

ABULFARAGIUS (Gregory), son to Aaron, a physician, born in 1226, in the city of Malatia, near the source of the Euphrates in Armenia. He followed the profession of his father; and practised with great success, numbers of people coming from the most remote parts to ask his advice. However, he would hardly have been known at this time, had his knowledge been confined to physic: but he applied himself to the study of the Greek, Syriac, and Arabic languages, as well as philosophy and divinity; and he wrote a history which does honour to his memory. It is written in Arabic, and divided into dynasties. It consists of ten parts, being an epitome of universal history from the creation of the world to his own time. Dr. Pocock published it with a Latin translation in 1663; and added, by way of supplement, a short continuation relating to the history of the eastern princes.

ABUS (Tacitus); a river of Britain, formed by the confluence of the Ure, the Derwent, Trent, &c. falling into the German sea, between Yorkshire and Lincolnshire, and forming the mouth of the Humber.

ABYDOS, anciently a town built by the Milesians in Asia, on the Hellespont, where it is scarce a mile over, opposite to Sestos on the European side (Dionysius Periegetes). Now both called the *Dardanelles*. Abydos lay midway between Lampacus and Ilium, famous for Xerxes's bridge (Herodotus, Virgil); and for the loves of Leander and Hero (Musaëus, Ovid); celebrated also for its oysters (Ennius, Virgil). The inhabitants were a soft, effeminate people, given much to detraction; hence the proverb, *Ne temere Abydum*, when we would caution against danger (Stephanus).

ABYDOS (Strabo, Pliny); anciently an inland town of Egypt, between Ptolemais and Diopolis Parva, towards

Syene; famous for the palace of Memnon, and the temple of Ophris. A colony of Milesians (Stephanus).

ABYO, or ABURO, one of the Philippine islands, in the East Indies, between Mindanao and Luzon, where the Spaniards have a fort. Long. 122. 15. E. lat. 10. 0.

ABYSSINIA (*Encycl.*), a kingdom of Africa, bounded on the N. by Sennar, or Nubia; on the E. partly by the Red Sea, and partly by Dancalia; on the W. by Gorcham; and on the S. by Gingiro and Alaba; lying between 6° and 20° N. lat. and 20° and 40° E. long. It is about 900 miles long, and 800 broad, and contains 378,000 square miles. The rainy season continues for six months, from April to September. This is succeeded, without interval, by a cloudless sky, and a vertical sun. Cold nights as instantly follow these scorching days.

The earth, notwithstanding these days, is perpetually cold, so as to feel disagreeable to the soles of the feet; partly owing to the six months' rains, when no sun appears, and partly to the perpetual equality of nights and days. There is no country in the world that produces a greater variety of quadrupeds, both wild and tame; but there are no tigers. The hyenas, however, are very numerous, and dreadful in their ravages. Besides many species of eagles, vultures, &c. (of which Mr. Bruce, in his celebrated Travels to discover the Source of the Nile, has given ample descriptions), there is a species of glede, called baddayn, which is likewise very frequent in Egypt, and comes punctually into Abyssinia, at the return of the sun, after the tropical rains. Vast variety of flocks cover the plains in May, when the rains become constant. There are few owls; but these are of an immense size and beauty. Of insects, the most remarkable is the Tlalatal or fly, which is so fatal to cattle, and even to the camel, that, in some particular countries, great emigrations are obliged to take place in the beginning of the rainy season, to prevent all their stock of cattle from being destroyed. According to Mr. Bruce, the celebrated river Nile has its source in this country, near the village of Geesh, in long. 36. 55. E. and lat. 10. 59. N. Gondar is the metropolis. There is a remarkable coincidence between the customs in the court of ancient Persia and those of Abyssinia. The religion of the country is a mixture of Judaism and of the Christianity of the Greek church.

ACACIUS; surnamed LUSCUS, because he was blind of one eye, was bishop of Cæsarea in Palestine, and succeeded the famous Eusebius; he had a great share in the banishment of Pope Liberius, and bringing Felix to the see of Rome. He gave name to a sect, and died about the year 365. He wrote the life of Eusebius, and several other works.

ACACIUS (St.), bishop of Amida, in Mesopotamia, 420, was distinguished by his piety and charity. He sold the plate belonging to his church, to purchase seven thousand Persian slaves who were ready to die with want and misery; and giving each of them some money, sent them home. Veranius, their king, was so affected with this noble instance of benevolence, that he desired to see the bishop; and this interview procured a peace between that prince and Theodosius I.

There have been several other eminent persons of the same name; particularly, a martyr under the emperor Decius: a patriarch of Antioch, who succeeded Basil in 458, and died in 459: a bishop of Miletum in the fifth century: a famous rhetorician in the reign of the Emperor Julian: and a patriarch of Constantinople in the fifth century; who was ambitious to draw the whole power and authority of Rome by degrees to Constantinople, for which he was delivered over irrevocably to the devil by Pope Felix III.

ACADEMY (*Encycl.*). The first academy we read of was composed of the chief wits of the court, the emperor himself being a member. In their academical conferences, every per-

son was to give an account of what ancient authors he had read; and each even assumed the name of some ancient author who pleased him most, or some celebrated person of antiquity. Alcuin, from whose letters we learn these particulars, took that of Flaccus, the surname of Horace: a young lord, named Angilbert, took that of Homer: Adclard, bishop of Corbie, was called Augustin: Riculf, bishop of Metz, was Dametas; and the king himself, David. See SCHOLAR. This shews the mistake of some modern writers, who relate, that it was in conformity with the genius of the learned men of those times, who were great admirers of Roman names, that Alcuin took the name of Flaccus Albinus.

Most nations have now their academies; but Italy has by far the greatest number. The French have many flourishing academies, most of which were established by Louis XIV.—We have but few in Britain; and those of chiefest note go by a different name. There are, however, in London, the *Academy of Painting*, and that of *Musick*; established by letters-patent, and governed by their respective directors.

In giving an account of the principal Academies, it seems most proper to arrange them according to their subjects.

I. *MEDICAL Academies*; as that of the *Natura Curiosi* in Germany; that founded at Palermo in 1645; another at Venice in 1701, which meets weekly in a hall near the grand hospital; another at Geneva in 1715, in the house of M. Le Clerc. The colleges of physicians at London and Edinburgh are also, by some, ranked in the number of *Academies*. See COLLEGE.

The Academy of *Natura Curiosi*, called also the Leopoldine Academy, was founded in 1652, by Jo. Laur. Baufchius, a physician: who, in imitation of the English, published an invitation to all physicians to communicate their extraordinary cases; and, meeting with success, was elected president. Their works were at first published separately; but in 1670 a new scheme was laid for publishing a volume of observations every year. The first volume appeared in 1684, under the title of *Ephemerides*, and the work has been continued with some interruptions and variations of the title, &c. In 1687, the Emperor Leopold took the society under his protection, granting the members several privileges, particularly that their presidents should be counts palatine of the holy Roman empire. This academy has no fixed residence or regular assemblies: instead of these, there is a kind of bureau, or office, first established at Breslau, and afterwards removed to Nuremberg, where letters, observations, &c. from correspondents or members are taken in. The academy consists of a president, two adjuncts or secretaries, and colleagues or members without restriction. The colleagues, at their admission, oblige themselves to two things: first, to choose some subject out of the animal, vegetable, or mineral kingdom, to handle, provided it had not been treated of by any colleague before; the second, to apply themselves to furnish materials for the Annual *Ephemerides*. Each member to bear a symbol of the academy, viz a gold ring, whereon, instead of a stone, is a book open, and, on the face thereof, an eye; on the other side the motto of the academy, *Namquam otiosus*.

II. *CHIRURGICAL Academies*; as that instituted some years ago, by public authority, at Paris: the members of which were not only to publish their own and correspondents observations and improvements; but to give an account of all that is published on surgery, and to compose a complete history of the art, by their extracts from all the authors, ancient and modern, who have wrote on it. A question in surgery is annually propounded by the academy, and a gold medal of two hundred livres value given to him who furnishes the most satisfactory answer.

III. *ECCLESIASTICAL Academies*; as that at Bologna in

Italy, instituted in 1687, employed in the examination of the doctrine, discipline, and history, of each age of the church.

IV. *COSMOGRAPHICAL Academies*; as that at Venice, called the *Argonauts*. This was instituted at the solicitation of F. Coronelli, for the improvement of geographical knowledge. Its design was to publish exact maps, both celestial and terrestrial, as well particular as general, together with geographical, historical, and astronomical descriptions. Each member, in order to defray the expence of such a publication; was to subscribe a proportional sum, for which they were to receive one or more copies of each piece published. For this end, three societies are settled; one under F. Moro, provincial of the Minorites in Hungary; another under the Abbot Laurence au Rue Payenne au Marais; the third under F. Baldigiani, Jesuit, professor of mathematics in the Roman college. The device of this academy is the terraqueous globe, with the motto *Plus ultra*; and at its expence all the globes, maps, and geographical writings, of F. Coronelli have been published.

V. *Academies of SCIENCES*.—These comprehend such as are erected for improving natural and mathematical knowledge. They are otherwise called *Philosophical and Physical Academies*.

The first of these was instituted at Naples, about the year 1560, in the house of Baptista Porta. It was called the *Academy Secretorum Nature*; and was succeeded by the *Academy of Lyncei*, founded at Rome by Prince Frederic Cesi, towards the end of that century. Several of the members of this academy rendered it famous by their discoveries; among these was the celebrated Galileo. Several other academies were instituted about that time, which contributed greatly to the advancement of the sciences; but none of them comparable to that of the *Lyncei*.

Some years after the death of Toricelli, the *Academy del Cimento* made its appearance, under the protection of Prince Leopold, afterwards Cardinal de Medicis. Redi was one of its chief members; and the studies pursued by the rest may be collected from those curious experiments published in 1667, by their secretary, Count Laurence Magliotti, under the title of *Saggi di Naturali Esperienze*; a copy of which was presented to the Royal Society, translated into English by Mr. Waller, and published at London in 4to.

The *Academy degl' Inquireti*, afterwards incorporated into that of Della Traccia in the same city, followed the example of that of Del Cimento. Some excellent discourses on physical and mathematical subjects, by Geminiano Montanari, one of the chief members, was published in 1667, under the title of *Pensieri Fifico Matematici*.

The *Academy of Ruffano*, in the kingdom of Naples, was originally an academy of Belles Lettres, founded in 1540, and transformed into an Academy of Sciences in 1605 at the solicitation of the learned abbot, Don Giacinto Gimma; who being made president, under the title of Promoter General thereof, gave them a new set of regulations. He divided the academists into the following classes:—Grammarians, Rhetoricians, Poets, Historians, Philosophers, Physicians, Mathematicians, Lawyers, and Divines, with a class apart for Cardinals and persons of quality. To be admitted a member, a man must have some degrees in the faculty. The members are not allowed to take the title of *Academists* in the beginning of their books, without a written permission from their president, which is not granted till the work has been examined by the censors of the Academy; and the permission is the greatest honour the Academy can confer, as they thereby adopt the work, and are answerable for it against all criticisms that may be made upon it. To this law the president or promoter himself is subject; and no academist is allowed to publish any thing against the writings of another, without leave from the society.

Several other Academies of Sciences have been founded in Italy; but, for want of being supported by princes, did not continue long. The loss of them, however, was abundantly repaired by the institution of others still subsisting; such as, the *Academy of Filarmooni* at Verona; of *Ricovatri* at Padua, where a learned discourse on the origin of springs was delivered by Sig. Vallinieri, first professor of physic in the university of that city, and which was afterwards printed. To the Academy of the *Muti de Regio*, at Modena, the same Sig. Vallinieri presented an excellent discourse on the scale of created beings, since inserted in his history of the generation of man and animals printed at Venice in the year 1721.

F. Merfenne is said to have given the first idea of a philosophical Academy in France, towards the beginning of the 17th century, by the conferences of naturalists and mathematicians occasionally held at his lodgings; at which Gassendi, Des Cartes, Hobbes, Roherval, Paical, Blondel, and others, assisted. F. Merfenne proposed to each certain problems to examine, or certain experiments to be made. These private assemblies were succeeded by more public ones, formed by Mr. Montmort, and Mr. Thevenot, the celebrated traveller. The French example animated several Englishmen of distinction and learning to erect a kind of philosophical academy at Oxford, towards the close of Oliver Cromwell's administration; which, after the Restoration, was erected into a Royal Society, See SOCIETY. The English example, in its turn, animated the French. Lewis XIV. in 1666, assisted by the counsels of Mr. Colbert, founded an Academy of Sciences at Paris, with a sufficient revenue to defray the charge of experiments, and salaries to the members.

Royal Academy of Sciences.—After the peace of the Pyrenees, Lewis XIV. being desirous of establishing the arts, sciences, and literature, upon a solid foundation, directed M. Colbert to form a society of men of known abilities and experience in the different branches, who should meet together under the king's protection, and communicate their respective discoveries. Accordingly Mr. Colbert, having conferred with those who were at that time most celebrated for their learning, resolved to form a society of such persons as were conversant in natural philosophy and mathematics, to join to them other persons skilled in history and other branches of erudition, along with those who were entirely engaged in what are called the *Belles Lettres*, grammar, eloquence, and poetry. The geometricians and natural philosophers were ordered to meet on Tuesdays and Saturdays, in a great hall of the king's library, where the books of mathematics and natural philosophy were contained; the learned in History to assemble on Mondays and Thursdays, in the hall where the books of history were contained; and the class of Belles Lettres to assemble on Wednesdays and Fridays. All the different classes were likewise ordered to meet together upon the first Thursday of every month; and, by their respective secretaries, make a report of the proceedings of the foregoing month.

In a short time, however, the classes of History, Belles Lettres, &c. were united to the French Academy, which was originally instituted for the improvement and refining the French language, so that the Royal Academy contained only two classes, viz. that of natural philosophy and mathematics.

In year 1696 the king, by a proclamation dated the 26th of January, gave this Academy a new form, and put it upon a more respectable footing.—It was now to be composed of four kinds of members, viz. *honorary, pensionary, associates, and élèves*. These last were a kind of pupils, or scholars, each of whom was attached to one of the pensionaries. The first class to contain ten persons, and each of the rest twenty. The honorary academists to be all inhabitants of France; the pensionaries all to reside at Paris; eight of the associates allowed to be foreigners; and the élèves all to live at Paris. The offi-

cers to be, a president named by the king, out of the class of honorary academicians; and a secretary and treasurer, to be perpetual. Of the pensionaries, three to be geometricians, three astronomers, three mechanics, three anatomists, three chemists, three botanists, and the remaining two to be secretary and treasurer. Of the twelve associates, two to apply themselves to geometry, two to botany, and two to chemistry. The eleven to apply themselves to the same kind of science with the pensionaries they were attached to; and not to speak, except when called by the president. No regular or religious to be admitted, except into the class of honorary academicians; nor any person to be admitted either for associate or pensionary, unless known by some considerable printed work, some machine, or other discovery. The assemblies were held on Wednesdays and Saturdays, unless either of them happened to be a holiday, and then the assembly was held on the preceding day.—To encourage the members to pursue their labours, the king engaged not only to pay the ordinary pensions, but even to give extraordinary gratifications, according to the merit of their respective performances; furnishing withal the expence of the experiments and other enquiries necessary to be made. If any member gave in a bill of charges of experiments he had made, or desired the printing of any book, and brought in the charges of gravings, the money was immediately paid by the king, upon the president's allowing and signing the bill. So, if an anatomist required live tortoises, for instance, for making experiments about the heart, &c. as many as he pleased were brought him at the king's charge. Their motto was, *Invent et perfice*.

In the year 1716, the Duke of Orleans, then regent, made an alteration in their constitution; augmenting the number of honoraries, and of associates capable of being foreigners, to 12; admitting regulars among such associates; and suppressing the class of elves, as it appeared to be attended with some inconveniences, particularly that of making too great an inequality among the Academicians, and being productive of some misunderstandings and animosities among the members. At the same time he created other two classes; one consisting of 12 adjuncts, who, as well as the associates, were allowed a deliberative voice in matters relative to science; and the other six free associates, who were not attached to any particular science, nor obliged to pursue any particular work.

After its re-establishment in 1699, this Academy was very exact in publishing, every year, a volume containing either the works of its own members, or such memoirs as had been composed and read to the Academy during the course of that year. To each volume is prefixed the history of the Academy, or an extract of the memoirs, and, in general, of whatever has been read or said in the Academy; at the end of the history, are the eulogiums on such Academicians as have died that year.—M. Rouille de McClay, counsellor to the parliament of Paris, founded two prizes, one of 2500, and the other of 2000 livres, which are alternately distributed by the parliament every year; the subject for the first must relate to physical astronomy, and those for the latter to navigation and commerce.

Notwithstanding the advantages which the members of this Academy enjoyed over others, in having their expences defrayed, and even being paid for their time and attendance, they have fallen under some imputations, particularly that of plagiarism. The French revolution, however, occasioned this Academy to be new modelled. See *INSTITUTE*.

The *Royal Society at Berlin* was founded in 1700, by Frederick II. king of Prussia, on the model of that of England, excepting that, besides natural knowledge, it likewise comprehends the Belles Lettres. In 1710 it was ordained that the president shall be one of the counsellors of state, and nominat-

ed by the king. The members were divided into four classes: the first for prosecuting physics, medicine, and chemistry; the second for mathematics, astronomy, and mechanics; the third for the German language and the history of the country; the fourth for oriental learning, particularly as it may concern the propagation of the gospel among infidels. Each class to elect a director for themselves, who shall hold his post for life. The members of any of the classes have free admission into the assemblies of any of the rest.

The great promoter of this institution was the celebrated Mr. Leibnitz, who accordingly was made the first director. The first volume of their Transactions was published in 1710, under the title of *Miscellanea Berolinensia*; and though they received but few marks of the royal favour for some time, they continued to publish new volumes in 1723, 1727, 1734, and 1740. At last, however, Frederick III. the late king of Prussia, gave new vigour to this Academy, by inviting to Berlin such foreigners as were most distinguished for their merit in literature, and encouraged his subjects to prosecute the study and cultivation of the sciences by giving ample rewards; and thinking that the academy, which till that time had had some minister, or opulent nobleman for its president, would find an advantage in having a man of letters at its head, he conferred that honour on M. Maupertuis. At the same time, he gave a new regulation to the academy, and took upon himself the title of its protector.

The Academicians held two public assemblies annually; one in January, on the late king's birth-day; and the other in May, on the day of his accession to the throne. At the latter of these was given, as a prize, a gold medal of 50 ducats value; the subject for this prize is successively, natural philosophy, mathematics, metaphysics, and erudition.

The *Imperial Academy at Petersburg* was projected by Czar Peter the Great, who had taken the necessary measures for its establishment, when he was prevented by death from putting them into execution. His successor, the Czarina Catherine, laboured on the same plan; and in a short time formed one of the most celebrated academies in Europe, composed of the most considerable foreigners, some of them settled at Petersburg. The memoirs of this academy, which are published in Latin, are highly valuable, particularly for the mathematical part. The academy, however, was in a very languishing condition, when the Empress Czarina Elizabeth attended the throne; but that princess, happily, naming Count Ralomowiki president, he gave it a new body of statutes, and quickly restored it to its ancient splendour.

The building and apparatus of this academy are extraordinary, there being a fine library, observatory, &c. It partakes much of what we call an *University*; having regular professors in the several faculties, who read lectures as in our schools. The ordinary assemblies are held twice a-week, and public or solemn ones thrice a-year. In the public assemblies an account is given of what has been done in the private ones. The academy has this modest motto, "*Parlatim*."

The *Academy of Sciences*, called the *Institute of Bologna*, was founded by Count Marsigli in 1712, for the cultivating of physics, mathematics, medicine, chemistry, and natural history. Its history is written by M. de Limiers, from memoirs furnished by the founder himself.

VI. *Academies of Law*; as that famous one at Beryta, and that of the Stientes at Bologna.

VII. *Academies of History*; as the *Royal Academy of Portuguese History* at Lisbon. This academy was instituted by King John V. in 1720. It consists of a director, four censors, a secretary, and 50 members; to each of which is assigned some part of the ecclesiastical or civil history of the nation, which he is to treat either in Latin or Portuguese. In the

church-history of each diocese, the prelates, synods, councils, churches, monasteries, academies, persons illustrious for sanctity or learning, places famous for miracles or relics, must be distinctly related in twelve chapters. The civil history comprises the transactions of the kingdom from the government of the Romans down to the present time. The members who reside in the country are obliged to make collections and extracts out of all the registers, &c. where they live. Their meetings to be once in fifteen days.

A medal was struck by this academy, in honour of their prince: the front of which was his effigy, with the inscription *Johannes V. Lusitanorum Rex*; and, on the reverse, the same prince is represented standing, and raising History almost prostrate before him, with the legend *Historia Rejuvenges*. Underneath are the following words in abbreviation: REGIA ACADEMIA HISTORIAE LUSITANÆ, INSTITUTA VI. Idus Decembris MDCCXX.

VIII. *Academies of Antiquities*; as that at Cortona in Italy, and at Upsal in Sweden. The first is designed for the study of Etruscan antiquities; the other for illustrating the northern languages, and the antiquities of Sweden, in which notable discoveries have been made by it. The head of the Etruscan Academy is called *Lucumon*, by which the ancient governors of the country were distinguished. One of their laws is to give audience to poets only one day in the year; another is to fix their fellows, and impose a tax of a dissertation on each member in his turn.

The *Academy of Medals and Inscriptions* at Paris was set on foot by M. Colbert, under the patronage of Lewis XIV. in 1663, for the study and explanation of ancient monuments, and perpetuating great and memorable events, especially those of the French monarchy, by coins, reliefs, inscriptions, &c. The number of members at first was confined to four or five, chosen out of those of the French Academy; who met in the library of Mr. Colbert, from whom they received his majesty's orders. The days of their meetings were not determined; but generally they met on Wednesdays, especially in the winter season; but, in 1691, the king having given the inspection of this academy to M. de Pontchartrain, comptroller-general, &c. he fixed their meetings on Tuesdays and Saturdays.

By a new regulation, dated the 16th of July, 1701, the academy was composed of ten *honorary* members; ten *associates*, each of whom had two declarative voices; ten *pensionaries*; and ten *élèves*, or pupils. They then met every Tuesday and Wednesday, in one of the halls of the Louvre; and had two public meetings yearly, one the day after Martinmas and the other the 16th after Easter. The class of *élèves* has been suppressed, and united to the associates. The king nominates their president and vice-president yearly; but their secretary and treasurer are perpetual. The rest are chosen by the members themselves, agreeably to the constitutions on that behalf given them.

One of the first undertakings of this academy was to compose, by means of medals, a connected history of the principal events of Lewis XIV.'s reign; but in this design they met with great difficulties, and of consequence it was interrupted for many years; but at length it was completed down to the advancement of the Duke of Anjou to the crown of Spain.

In this celebrated work, the establishment of the academy itself was not forgot. The medal on this subject represents Mercury sitting, and writing with an antique stylus on a table of brass; he leans with his left hand upon an urn full of medals, and at his feet are several others placed upon a card: the legend, *Rerum gestarum fides*; and on the exergue, *Academia regiae inscriptionum et numismatum, instituta M.DC.LXIII.* signifying that the Royal Academy of Medals and Inscriptions, founded in 1663, ought to give to future ages a faithful testi-

mony of all great actions. Besides this work, we have several volumes of their memoirs; and their history, written and continued by their secretaries.

IX. *Academies of Belles Lettres*, are those wherein eloquence and poetry are chiefly cultivated. There are very numerous in Italy, and not uncommon in other countries.

The *Academy of Umidi* at Florence has contributed greatly to the progress of the sciences by the excellent Italian translations given, by some of its members, of the ancient Greek and Latin historians. Their chief attention is to the Italian poetry, at the same time that they have applied themselves to the polishing of their language, which produced the *Academy La Crusca*.

The *Academy of Humorists, Umoristi*, had its origin at Rome from the marriage of Lorenzo Marini, a Roman gentleman; at which several persons of rank were guests; and, it being carnival time, to give the ladies some diversion, they betook themselves to the reciting of verses, sonnets, speeches, first *ex tempore*, and afterwards premeditated; which gave them the denomination of *Belli Humori*. After some experience, coming more and more into the taste of these exercises, they resolved to form an Academy of Belles Lettres; and changed the title of *Belli Humori* for that of *Humoristi*; choosing for their device a cloud, which, after being formed of exhalations from the salt waters of the ocean, returns in a gentle sweet shower; with this motto from Lucretius, *Redit agmine dulci*.

In 1699, the *Academy of Arcadi* was established at Rome, for reviving the study of Poetry and of the Belles Lettres. Besides most of the politer wits of both sexes in Italy, this academy comprehends many princes, cardinals, and other ecclesiastics; and, to avoid disputes about pre-eminence, all appear masked after the manner of Arcadian shepherds. Within ten years from its first establishment, the number of *Academists* amounted to six hundred. They hold assemblies seven times a-year, in a mead or grove, or in the gardens of some nobleman of distinction. Six of these meetings are employed in the recitation of poems and verses of the Arcadi residing at Rome; who read their own compositions; except ladies and cardinals, who are allowed to employ others. The seventh meeting is set apart for the compositions of foreign or absent members.

This academy is governed by a *Custos*, who represents the whole society, and is chosen every four years, with a power of electing 12 others yearly for his assistance. Under these are two sub-custodes, one vicar or pro-custos, and four deputies or superintendants, annually chosen. The laws of the society are immutable, and bear a near resemblance to the ancient model.

There are five manners of electing members. The first is by *acclamation*. This is used when sovereign princes, cardinals, and ambassadors of kings, desire to be admitted; and the votes are then given *vice voce*. The second is called *an- numeration*. This was introduced in favour of ladies and academical colonies, where the votes are taken privately. The third, *representation*, was established in favour of colonies and universities, where the young gentry are bred; who have each a privilege of recommending one or two members privately to be ballotted for. The fourth, *surrogation*, whereby new members are substituted in the room of those dead or expelled. The last, *destination*, whereby, when there is no vacancy of members, persons of poetical merit have the title of Arcadi conferred upon them, till such time as a vacancy shall happen. All the members of this body, at their admission, assume new pastoral names; in imitation of the shepherds of Arcadia. The academy has several colonies of Arcadi in different cities of Italy, who are all regulated after the same manner.

X. *ACADEMIES of Languages*; called, by some, *Grammatical Academies*; as,

The *Academy della Crusca* at Florence, famous for its vocabulary of the Italian tongue, was formed in 1582, but scarce heard of before the year 1584, when it became noted for a dispute between Tassio and several of its members. Many authors confound this with the Florentine academy. The discourses which Toricelli, the celebrated disciple of Galileo, delivered in the assemblies, concerning levity, the wind, the power of percussion, mathematics, and military architecture, are a proof that these academists applied themselves to things as well as words.

The *Academy of Tricasseri* had its rise in 1617, at an assembly of several princes and nobility of the country, who met with a design to refine and perfect the German tongue. It flourished long under the direction of princes of the empire, who were always chosen presidents. In 1668 the number of members arose to upwards of 900. It was prior in time to the French academy, which only appeared in 1629, and was not established into an academy before the year 1635. Its history is written in the German tongue, by George Neumark.

The *French Academy*, which had its rise from a meeting of men of letters in the house of M. Conrart, in 1629. In 1635 it was erected into an academy, by Cardinal Richieu, for refining and ascertaining the French language and style.—The number of its members was limited to 40; out of whom a director, chancellor, and secretary, were to be chosen: the two former held their post for two months, the latter perpetual. The members of this academy enjoyed several privileges and immunities, among which was that of not being obliged to answer before any court but that of the king's household. They met three times a-week in the Louvre; at breaking up, forty silver medals were distributed among them, having on one side the King of France's head, and on the reverse, *Protecteur de l'Académie*, with laurel, and this motto, *A l'immortalité*. By this distribution, the attendance of the *Academists* was secured, those who were present receiving the surplus otherwise intended for the absent. To elect or expel a member, at least eighteen were required; nor could any be chosen unless he petitioned for it: by this expedient, the affront of refusals from persons elected was avoided. Religious were not admitted; nor could any nobleman, or person of distinction, be admitted on another footing than as a man of letters. None have been expelled, except for base and dishonest practices; and there are but two instances of such expulsions, the first of M. Granier for refusing to return a deposit, the other of the Abbé Furetiere for plagiarism.—The design of this academy was to give not only rules, but examples, of good writing. They began with making speeches on subjects taken at pleasure, about twenty of which were printed. They met with great opposition from the parliament at their first institution; it being two years before the patents granted by the king would be registered. They have been severely satyrized, and their style has been ridiculed as enervating instead of refining the French language. They are also charged with having surfeited the world by flattery, and having exhausted all the topics of panegyric in praise of their founder; it having been a duty incumbent on every member, at his admission, to make a speech in praise of the King, the Cardinal, the Chancellor Segulier, and the person in whose place he was elected. The most remarkable work of this academy is a dictionary of the French tongue; which, after 50 years spent in settling the words and phrases to be used in writing, was at last published in 1694.

The *Royal Spanish Academy* at Madrid held its first meeting in July, 1713, in the palace of its founder, the Duke d'Escalona. It consisted at first of eight academists, including the duke; to which number 14 others were afterwards added, the founder being chosen president or director. In 1714 the

king granted them his confirmation and protection. Their device is a crucible in the middle of the fire, with this motto, *Limpia, fya, y da Eplendor*.—"It purifies, fixes, and gives brightness." The number of members is limited to 24; the Duke d'Escalona to be director for life, but his successors chosen yearly, and the secretary to be perpetual. Their object, as marked out by the royal declaration, was to cultivate and improve the national language: they were to begin with choosing carefully such words and phrases as have been used by the best Spanish writers; noting the low, barbarous, or obsolete ones; and composing a dictionary wherein these may be distinguished from the former.

XI. *ACADEMIES of Dancing*; as that once erected by Lewis XIV. with privileges above all the rest.

XII. *ACADEMIES of Painting*; as the celebrated *Academy of Painting and Sculpture* at Paris. This took its rise from the disputes that happened between the master painters and sculptors in that capital; in consequence of which, M. Le Brun, Sarazin, Comille, and others of the king's painters, formed a design of instituting a particular academy; and, having presented a petition to the king, obtained an arret, dated January 20, 1648. In the beginning of 1655 they obtained, from Cardinal Mazarin, a brevet, and letters patent, which were registered in parliament; in gratitude for which favour, they chose the cardinal for their protector, and the chancellor for their vice-protector. In 1663, by means of M. Colbert, they obtained a pension of 4000 livres. The academy consisted of a protector, a vice-protector, a director, a chancellor, four rectors, adjuncts to the rectors, a treasurer, four professors, one of which was professor of anatomy, and another of geometry; several adjuncts and counsellors, an historiographer, a secretary, and two others.

The Academy of Painting held a public assembly every day for two hours in the afternoon, to which the painters resorted either to design or to paint, and where the sculptors modelled after a naked person. There were 12 professors, each of whom kept the school for a month; and there were 12 adjuncts to supply them in case of need. The professor upon duty placed the naked man as he thought proper, and set him in two different attitudes every week. This they called *setting the model*. In one week of the month he sets two models together, which was called *setting the group*. The paintings and models made after this model, were called *academics*, or *academy-figures*. They had likewise a woman who stood for a model in the public school. Every three months, three prizes for design were distributed among the *élèves* or disciples; two others for painting, and two for sculpture, every year.

There was also an Academy of Painting, Sculpture, &c. at Rome, established by Lewis XIV. wherein those who had gained the annual prize at Paris were entitled to be three years entertained at the king's expence, for their further improvement.

XIII. *Academies of ARCHITECTURE*; as that established by M. Colbert in 1671, consisting of a company of skilful architects, under the direction of the superintendent of the buildings.

XIV. *Academies of POLITICS*; as that at Paris, which consisted of six persons, who met at the Louvre, in the chamber where the papers relating to foreign affairs were lodged. But this academy proved of little service, as the kings of France were unwilling to trust any but their ministers with the inspection of foreign affairs.

ACALANDRA, a town of Lucania, on the other side the Appennine (Strabo); now *Salandra*, in the Basilicata, on the river Acalandrus.

ACAMANTIS, the ancient name of the island Cyprus, taken from one of its promontories, situate to the west.

ACAMAS, son of Theseus, followed the rest of the Grecian princes to the siege of Troy; and was deputed, with Diomedes, to the Trojans, in order to get Helen restored. Laodice, Priam's daughter, fell in love with him, stole a night with him, and had a son by him, called Munitus. He was one of the heroes who concealed themselves in the wooden horse. One of the tribes of Athens was called *Acamantides* from him, by the appointment of the oracle. He founded a city in Phrygia Major, called *Acamantium*; and made war against the Solymis.

ACAMBOU, or *ΑΚΑΜΒΟΕ*, a country of Africa, and one of the most powerful kingdoms on the coast of Guinea. The country is populous, and the commerce considerable; the people are brave, and fond of war, inclined to rapine, and cruel. Long. about 20. W. Greenwich. Lat. 6. N.

ACANTHOS (*Encycl.*), a town of Egypt, near which was shewn Xerxes's ditch, of seven stadia, in order to separate mount Athos from the continent, and convey his ships, without doubling Athos, into the Singitic Bay. *Acanthus* is also a town of Epirus.

ACANTHUS (*Encycl.*), bears-breach. There are five species. 1. *The mollis*, or common bear's-breach, a native of Italy, is the sort that is used in medicine, and is supposed to be the *mollis acanthus* of Virgil: the leaves of this species are famous for having given rise to the capital of the Corinthian pillars. 2. *The spinosus*, or prickly bear's-breach; the leaves of which are deeply jagged in very regular order, and each segment is terminated with a sharp spine, as are also the foot-stalks of the leaves and the empalement of the flower, which renders it troublesome to handle them. 3. *Illiciifolius*, or shrubby bear's-breach, grows naturally in both the Indies. It is an evergreen shrub, which rises about four feet high; and is divided into many branches, garnished with leaves like those of the common holly, and armed with spines in the same manner: the flowers are white, and shaped like those of the common acanthus, but smaller. 4. *The nigra*, or Portugal bear's-breach, with smooth sinuated leaves of a livid green colour, was discovered in Portugal by Dr. Jussieu of the royal garden at Paris. 5. *The middle bear's-breach*, with entire leaves, having spines on their border, is supposed to be the acanthus of Dioscorides.

They are all perennial plants. The first and second species may be propagated either by seeds, or by off-sets from the roots. The third, fourth, and fifth sorts, are propagated only by seeds; which, as they do not ripen in Europe, must be obtained from the places in which they grow naturally: the plants are so tender, that they cannot be preserved out of the stove in this country.

ACANTHUS is likewise used by Theophrastus as a synonyme of the acacia.

ACANUS, in botany, a synonyme of *carduus calceolaria* of Linnaeus. See *CARDUUS*.

ACARNANIA, the first country of Free Greece, or Greece Proper, bounded on the west by the Sinus Ambracius, and separated from Ætolia by the river Achelous on the east, and by the Sinus Ambracius from Epirus. The people were called *Acarnanes*, denoting persons unshorn: other Ætolians, to the east of the Achelous, being called *Curetes* (Homer), from being shorn. According to Lucian, they were noted for effeminacy and incontinence; hence the proverb, *Porcellus Acarnanius*. This country was famous for an excellent breed of horses; so that *Ακαρνες ιππες*, is a proverbial saying for a thing excellent in its kind. It is now called *la Carnia* and *il Delipotato*.

ACARON, or *ACCARON* (*Encycl.*), a town of Palestine. It was the boundary of the Philistines to the north; stood at some distance from the sea, near Bethisemeth; and was famous for the idol of Baalzebub.

ACARUS (*Encycl.*), a genus of insects belonging to the order of aptera. The description of a few of the most remarkable we here introduce. 1. *The firo*, or cheele-mite, a very minute species, already described. 2. *The sanguifugus*. The hinder part of the abdomen is crenated, the scutellum is oval and yellowish, and the beak is trifid. It is a native of America, and sticks to fast on the legs of travellers, sucking their blood, that they can hardly be extracted. 3. *The telarius*, is of a greenish yellow colour. It has a small sting or weapon, with which it wounds the leaves of plants, and occasions them to fold backward. They are very frequently to be met with in the autumn, inclosed in the folded leaves of the lime-tree. 4. *The exulcerans*, or itch-acarus, is a very small species: its body is of a figure approaching to oval, and lobated; the head is small and pointed; its colour is whitish, but it has two dusky semicircular lines on the back. It has long setaceous legs, but the two first are short. It is found in the pustules of the itch: authors in general have supposed that it causes that disease; but if this were so, it would be found more universally in those pustules. It is more probable that these only make a proper nidus for it. 5. *The batatas*, is of a blood-colour, and a little rough; the fore pair of legs are as long as the body. It inhabits the potatoes of Surinam. 6. *The ovinus*, or sheep tick, has a flat body, of a roundish figure, but somewhat approaching to oval, and of a yellowish white colour, and has a single large round spot on the back: the anus is visible in the lower part of the body; the thorax is scarce conspicuous; the head is very small and black; the mouth is blind: the antennæ are of a clavated figure, and of the length of the snout; the legs are short and black. It is common on sheep, and its excrements stain the wool green: it will live in the wool many months after it is shorn from the animal. 7. *The coleoptratorum*, or acarus of insects, is extremely minute: its body is round, reddish, and covered with a firm and hard skin; the head is very small, the neck scarce visible; the legs are moderately long, the anterior pair longer than the others; it has a whiteness about the anus. It is frequent on the bodies of many insects, which it infects, as the louse does others; it runs very swiftly: the humble-bee, and many other of the larger insects, are continually infested with it; but none so much as the common black beetle, which has thence been called the lousy beetle. 8. *The baccarum*, or scarlet tree-mite, is a small species: its body is roundish, and the back not at all flattened, as it is in many others; the skin is smooth, shining, and glossy; and the whole animal seems distended, and ready to burst; the colour is a bright red, but a little duskier on the sides than elsewhere: the head is very small, and the legs short; there is on each side a small dusky spot near the thorax, and a few hairs grow from different parts of the body. It is very common on trees, particularly on the currant, on the fruit of which we frequently see it running. 9. *The longicorvus*, or red stone-acarus, is very small, and of a bright red colour: the body is round, and distended; the head is very small, and pointed; the legs are moderately long, and of a paler red than the body: the antennæ are much longer than in any other species. It is frequent about old stone-walls and on rocks, and runs very nimbly. 10. *The aquaticus* is a small species: the body is of a figure approaching to an oval, and the back appears depressed: it is of a bright and strong scarlet colour. The head is small; the legs are moderately long and firm, and are of a paler red than the body. It is common in shallow waters, where it runs very swiftly along the bottom. 11. *The holycericeus* is a small species: its body is roundish, but a little approaching to oval; the back somewhat depressed: it is of a fine scarlet colour, and covered with a velvety down. The head is very small; the eyes are two, and very small; the legs are short and of a

paler red, and there is a small black spot near the insertion of the anterior ones. It is very common under the surface of the earth, and sometimes on herbs and among hay. It is supposed to be poisonous, if swallowed; but we do not seem to have any certain account of such an effect. 12. The *longipennis* (Pl. 9.) is the largest of the acarus kind: its body is roundish, of a dusky brown on the back, with a duskiest spot of a rhomboidal figure near the middle of it; the belly is whitish; the legs are extremely long and slender. On the back part of the head there stands a little eminence, which has on it a kind of double crest, formed as it were of a number of minute spines: the eyes are small and black, and are two in number. It is very common in our pastures, towards the end of summer. Ray and Lister call it *araneus cryfatus longipennis*; Mouffet, *araneus longipennis*; and, notwithstanding its having but two eyes, it has been almost universally ranked among the spiders.

ACASTUS, in classic history, the son of Pelias king of Thessaly, and one of the most famous hunters of his time, married Hippolyta, who falling desperately in love with Pelus her son-in-law, and her refusing to gratify her wishes, the accursed him to her husband of a rape; on which he slew them both.

ACATALUS, the juniper berry.

ACAT-ASTAIOS, *inconstant*, is an ancient physical term, applied to irregular fevers, whose paroxysms are uncertain, and which are indicated by frequent changes in the urine. It is likewise applied to those shivering fits in fevers, which have no constant return; and to turbid urine, that deposits no regular sediment.

ACAULOSE, or ACAULOUS, is applied, by botanists, to those plants which have no proper stem, or CAULIS.

ACBAB, in natural history, a name given by the people of the Philippine islands to a bird, very like our common hen, which is very frequently wild among them. It lives on rice, and other vegetables, and does a great deal of mischief; but is short-winded, and does not fly well, so that it is easily destroyed.

ACBAR, the name of an idol of enormous size, which the Arabians are said formerly to have worshipped. It was with difficulty that Mahomet restrained them from this species of idolatry. Hyde's *Disc.* vol. i. p. 257.

ACCASDIR, a name given to a metal which we call TIN.

ACCEDONES. See ACCENDONES, below.

ACCENDONES (*Encycl.*). See GLADIATOR. The orthography of the word is contested: the first edition of Tertullian, by Rhenanus, has it *accedones*; an ancient manuscript, *accendones*. Aquinas adheres to the former, Pitiscus to the latter. The origin of the word, supposing it *accendones*, is from *accendo*, I kindle; supposing it *accedones*, from *accedo*, I accede, am added to. The former places their distinguishing character in enlivening the combat by their exhortations and suggestions; the latter supposes them to be much the same with what among us are called *seconds*, among the Italians *patroni*; excepting that these latter only stand by to see the laws of the sword duly observed, without intermeddling to give advice or instruction.

ACCENSI (*Encycl.*). Vegetius calls these *supernumerarii legionum*. Cato calls them *ferentarii*, in regard they furnished those engaged in battle with weapons, drink, &c. Though Nonnius suggests another reason of that appellation, viz. because they fought with stones, slings, and weapons *que feruntur*, such as are thrown, not carried in the hand. They were sometimes also called *velites*, and *relati*, because they fought clothed, but not in armour; sometimes *adscripticii*, and *adscriptici*; sometimes *rorarii*. The *accensi*, Livy observes, were placed at the rear of the army, because no great matter was

expected from them: they were taken out of the fifth class of citizens.

ACCENT, in music (*Encycl.*). Every bar or measure is divided into *accented* and *unaccented* parts. The accented parts are the principal; being those intended chiefly to move and affect: it is on these the spirit of the music depends. The beginning and middle, or the beginning of the first half of the bar, and of the latter half of it, in common time; and the beginning of the three notes in triple time, are always the accented parts of the measures.

In common time, the first and third crotchet of the bar are on the accented part of the measure.—In triple time, where the notes always go by three and three, that which is in the middle of every three is always unaccented; the first and last accented. But the accent in the first is so much stronger, that in many cases the last is accounted as if it had no accent. The harmony is always to be full and void of discords in the accented parts of the measure. In the unaccented parts this is not so absolutely necessary; discords here passing without any great offence to the ear.

ACCENTER, in music, one of the three fingers in a trio, viz. the person who sings the highest part. See TRIO.

ACCEPTANCE, in commerce (*Encycl.*). The acceptance is usually performed by him on whom the bill is drawn; upon its being presented to him by the person on whose behalf it was drawn, or by some others by his order.

A small matter amounts to an acceptance, so that there be a right understanding between both parties; as, "Leave your bill with me, and I will accept it;" or, "Call for it to-morrow, and it shall be accepted." This obliges as effectually by the custom of merchants, and according to law, as if the party had actually subscribed, or signed it, which is usually done. But should a man say, "Leave your bill with me; I will look over my accounts and books between the drawer and me, and call to-morrow, and accordingly the bill shall be accepted;" this shall not amount to a complete acceptance; for this mention of his books and accounts was really intended to give him an opportunity of examining if there were effects in his hands to answer; without which perhaps he would not accept the same; and so it was ruled by the Lord Chief-justice Hale, at Guildhall, London.

A bill may be accepted for part; because the party, upon whom the same was drawn, had no more effects in his hands; which being usually done, there must be a protest, if not for the whole sum, yet at least for the residue; however, after payment of such part there must be a protest for the remainder.

Bills payable at sight are not to be accepted; as being to be acquitted at their presenting; or in defect of payment, to be protested.—In bills drawn for a certain number of days after sight, the acceptance must be dated; because the time is to be accounted therefrom.—The form of this acceptance is, *Accepted, such a day*; and then the signature.

Bills drawn, payable on a day named, or at usance, or double usance, need not be dated; usance being reckoned from the date of the bill itself.—On these it is sufficient to write, *Accepted*, and the signature.

If the bearer of a bill be contented with an acceptance to be paid in twenty days after sight, where, in the bill itself, only eight days are expressed, he runs the risk of the twelve additional days: so that if the acceptor fail he has no remedy against the drawer. And if the bearer contents himself to receive a less sum than is expressed, in part, he is to stand the chance of the rest.

ACCI, a town of Tarraconensis (Pliny, Ptolemy); formerly called *Adi*, supposed to be Guadix, to the east of the city

of Granada, at the foot of a mountain, near the source of the rivulet Guadalatin. Now greatly decayed. It is the Colonia Accitana Gemella (coins); and was of some repute among the Roman colonies. The people were called Gemellenses, because the colony consisted of colonists from the third and sixth legions.

ACCIAIOLI (Donato), a man famous for his learning and the honourable employments he possessed in Florence his native country, in the 15th century. He wrote, a Latin translation of some of Plutarch's Lives; Commentaries on Aristotle's Ethics and Politics; and the Life of Charlemagne. He was sent to France by the Florentines, to sue for succour from Lewis XI. against Pope Sixtus IV. but died on his journey at Milan; his body was carried to Florence, and buried in the church of the Carthusians. The small fortune he left his children is a proof of his probity and disinterestedness. His daughters, like those of Aristides, were married at the public expense, as an acknowledgment of his services. His funeral eulogium was spoken by Christopher Landini; and an elegant epitaph, by Politian, was inscribed on his tomb.

ACCIPESIU, in ichthyology, a name given by Athenæus and others of the Greek writers, to theurgeon, called by others *oncos*. See **ACCIPENSER**, below.

ACCIPENSER (*Encycl.*), in ichthyology, a genus of fishes belonging to the Amphibia Nantes of Linnæus. See Pl. 10. The ancients were acquainted with the huso, the fish that affords isinglass. Pliny mentions it under the name of *ICHTHYOCOLLA*; and says, that the glue that was produced from it had the same title; and afterwards adds, that it was made out of the belly of the fish. The huso is the largest of the genus, and grows to 24 feet in length. It inhabits the Danube and the rivers of Russia.

The sturio, orurgeon, is probably the *ὐστρυον* of Dorion, as quoted by Athenæus, who says its mouth is always open, and that it conceals itself in the hot months. This shews it to be a fish of a cold nature; which is confirmed by the history of the European fish of this species given by Mr. Foster, in his Essay on the *Volga*. He relates, that they are scarce ever found in that river in spring or summer, but in vast quantities in autumn and winter, when they crowd from the sea under the ice, and are then taken in great numbers. Theurgeon is seldom taken far out at sea, but frequents such parts as are not remote from the æstuaries of great rivers. It is admired for the delicacy and firmness of its flesh, which is white as veal, and extremely good when roasted. It is generally pickled. The most we receive comes either from the Baltic rivers, or North America: those cured at Pillau have been, till of late, in the greatest repute; but through the encouragement given by the society instituted for promoting trade and manufactures, theurgeon from our colonies begins to rival those of the Baltic. Great numbers are taken during summer in the lakes Frische-haff, and Curisch-haff near Pillau, in large nets made of small cord. The adjacent shores are formed into districts, and farmed out to companies of fishermen, some of which are rented for six thousand guilders, or near three hundred pounds, *per annum*. They are found in vast abundance in the American rivers in May, June, and July; at which time they leap some yards out of the water, and, falling on their sides, make a noise to be heard in still weather at some miles distance. Caviare is made of the roes of this; and also of all the other sorts of sturgeons, dried, salted, and packed up close. Ichthyocolla, or isinglass, is also made of the sound of our fish, as well as that of the others; but in very small quantity. Theurgeon grows to a great size, to the length of 18 feet, and to the weight of 500 pounds, but it is seldom taken in our rivers of that bulk. The largest we have known caught in those of Great Britain, weighed 460 pounds; which was

taken about three years ago in the Elk, where they are more frequently found than in our southern waters. In the manner of breeding, this fish is an exception among the cartilaginous kind; being, like the bony fish, oviparous, spawning in water.

ACCIPITER (*Encycl.*). Pliny tells us, that in some cases, particularly in marriage, this was esteemed a bird of good omen, because it never eats the hearts of other birds; intimating thereby, that no differences in a married state ought to reach the heart. The accipiter was worshipped as a divinity by the inhabitants of Tentyra, an island in the Nile, being considered by them as the image of the sun; and hence we find that luminary represented, in hieroglyphics, under the figure of a hawk.

ACCIPITRINA, in botany, a name by which some authors have expressed the hawk-weed, and others, the flax-weed or *sophia chirurgorum*. Ger. Emac.

ACCIIUS (Lucius), a Latin tragic poet, the son of a freedman, and, according to St. Jerom, born in the consulship of Hostilius Mancinus and Attilius Serranus, in the year of Rome 583; but there appears somewhat of confusion and perplexity in this chronology. He made himself known before the death of Pacuvius, a dramatic piece of his being exhibited the same year that Pacuvius brought one upon the stage, the latter being then eighty years of age, and Accius only thirty. We do not know the name of this piece of Accius's, but the titles of several of his tragedies are mentioned by various authors. He wrote on the most celebrated stories which had been represented on the Athenian stage; as Andromache, Andromeda, Atreus, Clytemnestra, Medea, Meleager, Philocletes, the civil wars of Thebes, Tereus, the Troades, &c. He did not always, however, take his subjects from the Grecian story; for he composed one dramatic piece wholly Roman: it was entitled *Brutus*, and related to the expulsion of the Tarquins. It is affirmed by some, that he wrote also comedies; which is not unlikely, if he was the author of two pieces, the *Wedding*, and the *Merchant*, which have been ascribed to him. He did not confine himself to dramatic writing; for he left other productions, particularly his *Annals*, mentioned by Macrobin, Priscian, Festus, and Nonius Marcellus. He has been censured for writing in too harsh a style, but in all other respects has been esteemed a very great poet. He was so much esteemed by the public, that a comedian was punished for only mentioning his name on the stage. Cicero speaks with great derision of one Accius who had written a history; and, as our author had written annals, some insist that he is the person censured: but as Cicero himself, Horace, Quintilian, Ovid, and Paterculus, have spoken of our author with so much applause, we cannot think it is him whom the Roman orator censures with so much severity.

There was also in this age a pretty good orator of the same name, against whom Cicero defended Cluentius. He was born in Pisa, and perhaps was a relation of our poet.

ACCIIUS, a poet of the 16th century, to whom is attributed *A Paraphrase on Esop's Fables*, on which Julius Scaliger bestows great encomiums.

ACCLAMATION (*Encycl.*). The acclamations of the Roman senate were somewhat more serious than the popular ones; but arose from the same principle, viz. a desire of pleasing the prince or his favourites; and aimed likewise at the same end, either to express the general approbation and zeal of the company, or to congratulate him on his victories, or to make him new protestations of fidelity. These acclamations were usually given after a report made by some senator, to which the rest all expressed their consent by crying *OMNES, OMNES*; or else, *ÆAVUM EST, JUSTUM EST*. Sometimes

Aconitum Pyrenaicum
Yellow Pyrenean Aconite

Acarus

Achillea Nobilis
Purple Tansy-leaved Yarrow

they began with acclamations, and sometimes ended with them without other debates. It was after this manner that all the elections and proclamations of emperors, made by the senate, were conducted; something of which practice is still retained at modern elections of kings and emperors, where *Vivat Rex, Vive le Roy, and Long live the King*, are customary forms.

The Greeks borrowed the custom of receiving their emperors in the public places from the Romans. Luitprand relates, that at a procession where he was present, they sung to the emperor Nicephorus, *πολλὰ ἔτη*; that is, "*Many years!*" which Codin expresses thus, by *το ἄλλοτε το πολυχρονία*, or by *το πολυχρονία*; and the wish of salutation by *πολυχρονία*. And at dinner, the Greeks then present wished with a loud voice to the emperor and Bardas, *Ὡς θεὸς ἀνὸς πολλαί*; as he translates the Greek. Plutarch mentions an acclamation of loud, upon occasion of Flaminius's restoring liberty to Greece, that the very birds fell from heaven with the shout. The Turks practise something like this on the sight of their emperors and grand viziers, to this day.

For the acclamations wherewith authors, poets, &c. were received, who recited their works in public; it is to be observed, the assemblies for this purpose were held with great parade in the most solemn places, as the capitol, temples, the Athæneum, and the houses of great men. Invitations were sent every-where, in order to get the greater appearance. The chief care was that the acclamations might be given with all the order and pomp possible. Men of fortune who pretended to wit, kept able applauders in their service, and lent them to their friends. Others endeavoured to gain them by presents and treats. Philostratus mentions a young man named Vavus, who lent money to the men of letters, and forgave the interest to such as applauded his exercises. These acclamations were conducted much after the same manner as those on the theatre, both as to the music and the accompaniments: they were to be suited both to the subject and to the person. There were particular ones for the philosophers, for orators, for historians, and for poets. It would be difficult to rehearse all the forms of them; one of the most usual was *Sophos*, which was to be repeated three times. Martial comprehends several other usual forms in this verse:

Graviter, Cito, Nequiter, Euge, Barre.

Neither the Greeks nor Romans were barren on this head. The names of gods and heroes were given those whom they would extol. It was not enough to do it after each head of discourse, chiefly after the exordium; but the acclamations were renewed at every fine passage, frequently at every period.

The acclamations wherewith the spectators honoured the victories of the athlete, were a natural consequence of the impetuous motions which attended the gymnastic games. The cries and acclamations of the people, sometimes expressing their compassion and joy, sometimes their horror and disgust, are strongly painted by different poets and orators.

ACCOLTI (Bernardo), secretary to the republic of Florence, was surnamed L'Unico, or the Non-Such, probably from the great extent of his understanding, the variety of sciences he had acquired, and the excellency of his poetic vein; which not only gained him a seat among the academicians of the court of Urbino, but made that great Mæcenas, Pope Leo X. in 1520, create him prince of the state of Nepi. He wrote many pieces; among others, a collection of choice poems, printed at Venice in 1519 and 1553.

ACCORD, in music. See CONCORD.

ACCORD, in painting, is the harmony that reigns among the lights and shades of a picture.

ACCURIUS, a law professor in the 13th century, born Vol. X.

in Florence. His authority was for some time so great, that he was called the Idol of the Lawyers.

ACCURIUS (Mariangelus), a famous critic of the 16th century, born at Aquilo in the kingdom of Naples. His Diatribes, printed at Rome in folio, in 1524, on Ovid and Solinus, are a proof of his abilities in that kind of erudition. In his edition of Ammianus Marcellinus there are five books more than in any of the preceding ones; and he affirms he had corrected 5000 errors in that historian. His predominant passion was the searching for and collecting of old manuscripts: yet he made Latin and Italian verses; was complete master of the French, German, and Spanish tongues; and understood optics and music. He purged himself by oath, being charged for being a plagiarist with regard to his Antonius; it being reported, that he had appropriated to himself the labours of Fabricio Varanæ, bishop of Camerino.

ACCUSATION (*Encycl.*). In Britain, by Magna Charta, no man shall be imprisoned or condemned on any accusation, without trial by his peers, or the law: none shall be vexed with any accusation, but according to the law of the land: and no man may be molested by petition to the king, &c. unless it be by indictment or presentment of lawful men, or by process at common law. Promoters of suggestions, are to find surety to pursue them; and if they do not make them good, shall pay damages to the party accused, and also a fine to the king. No person is obliged to answer upon oath to a question whereby he may accuse himself of any crime.

ACCUSIUM COLONIA (Ptolemy); an inland town in the Cavares, in Gallia Norbonensis: now *Grenoble*, in Dauphiné. See *GRENOBLE*.

ACCERRÆ, the ancient name of a town on the Clanius, in Campania, not far from Naples (Virgil); now *ACCERRA*,—The name also of another town (Plutarch, Polybius), now called *la Girola*, in the territory and to the south-east of Lodi, where the rivulet Serio falls into the Adda, to the west of Cremona and north of Piacenza.

ACCIOLI (Donatus), a Florentine of great learning, who lived in the fifteenth century. He was honoured with many considerable employments in his native country; but, notwithstanding his public engagements, he found means to devote part of his time to study. He had been a disciple of Argyropylus the Byzantine; and he published commentaries on this professor's Latin translation of Aristotle's Ethics. He acknowledges, in his epistle dedicatory to Cosmo de Medicis, that he collected these commentaries from the lectures of Argyropylus; and that he had only enlarged the explanations which he had heard. Simon Simonius and Gabriel are therefore in the wrong, after such a declaration, when they accuse him of publishing in his own name a work of Argyropylus. He translated the lives of Alcibiades and Demetrius from Plutarch; to which were also added those of Annibal and Scipio, which some have imagined to be likewise from Plutarch; but this must be a mistake, since we find neither of these two generals in this author. He wrote an abridgment of the life of Charlemagne; and some other works are also ascribed to him.

He was sent to France by the Florentines, to sue for succour from Louis XI. against Pope Sixtus IV. but died on his journey at Milan; his body was carried to Florence, and buried in the church of the Carthusians. The small fortune he left his children is a proof of his probity and disinterestedness. His daughters, like those of Arifides, were married at the public expense, as an acknowledgment of his services.

ACCIUS (Lucius), a Latin tragic poet, the son of a freedman, and, according to St. Jerome, born in the consulship of Hostilius Mancinus and Attilius Serranus, in the year of Rome 583; but there appears somewhat of confusion and perplexity

in this chronology. He made himself known before the death of Pacuvius, a dramatic piece of his being exhibited the same year that Pacuvius brought one upon the stage, the latter being then eighty years of age, and Accius only thirty. We do not know the name of this piece of Accius, but the titles of several of his tragedies are mentioned by various authors. He wrote on the most celebrated stories which had been represented on the Athenian stage, as Andromache, Andromeda, Atreus, Clytemnestra, Medea, Melicerg, Philocletes, the civil wars of Thebes, Tereus, the Troades, &c. He did not always, however, take his subjects from the Grecian story; for he composed one dramatic piece wholly Roman: it was entitled Brutus, and related to the expulsion of the Tarquins. It is affirmed by some, that he wrote also comedies, which is not unlikely, if he was the author of two pieces, the Wedding and the Merchant, which have been ascribed to him. He did not confine himself to dramatic writing, for he left other productions, particularly his Annals, mentioned by Macrobius, Priscian, Festus, and Nonius Marcellus. He has been censured for writing in too harsh a style, but in all other respects esteemed a very great poet. Aulus Gellius tells us, that Accius, being in his way to Asia, passed through Tarentum, where he paid a visit to Pacuvius, and read to him his play of Atreus; that Pacuvius told him his verse was lofty and sonorous, but somewhat harsh and crude. "It is, as you observe," said Accius, "nor am I sorry for it, since my future productions will be better on this account; for as in fruit, so in geniuses, those which are at first harsh and sour, become mellow and agreeable; but such as are at first soft and sweet, grow in a short time not ripe, but rotten." Accius was so much esteemed by the public, that a comedian was punished for only mentioning his name on the stage. Cicero speaks with great derision of one Accius who had written a history, and, as our author had written annals, some insist that he is the person censured; but as Cicero himself, Horace, Quintilian, Ovid, and Paterculus, have spoken of our author with so much applause, we cannot think it is he whom the Roman orator censures with so much severity.

There was also in this age a good orator of the same name, against whom Cicero defended Cluentius. He was born in Pisaurum, and perhaps was a relation of our poet.

ACCORDS (Stephen Tabourot, seigneur des), advocate in the parliament of Dijon in France, and king's advocate in the bailiwick and chancery of that city, born in the year 1549. He was a man of genius and learning, but too much addicted to trifles, as appears by his piece entitled "Les Bigarrures," printed at Paris in 1582. This was not his first production, for he had before printed some sonnets. His work entitled "Les Touches," was published at Paris in 1585; which is indeed a collection of witty poems, but most of them upon obscene subjects, and worked up rather in too loose a manner, according to the licentious taste of that age. His Bigarrures are written in the same strain. He was censured for this way of writing, which obliged him to publish an apology. La Croix du Maine says in one place, that Accords wrote a dictionary of French rhymes; but he afterwards corrected himself, having found that John le Fevre of Dijon, secretary to Cardinal De Givre, and canon of Langres, was the author thereof. Accords himself mentions him as the author, and declares his intention of compiling a supplement to his uncle Le Fevre's work; but, if he did, it never appeared in print. The lordship of Accords is an imaginary fief or title from the device of his ancestors, which was a drum, with the motto *à tous accords*, chiming with all. He died July 24, 1561, in the 46th year of his age.

ACEPHALI, the levellers in the reign of King Henry I.

who acknowledged no head or superior. They were reckoned so poor, that they had not a tenement by which they might acknowledge a superior lord.

ACEPHALOUS, or ACEPHALUS, (*Encycl.*) Several opinions have been framed as to the origin of the fable of the Acephali. The first is that of Thomas Bartholin, who turns the whole into a metaphor; being convinced that the name Acephali was anciently given to such as had less brain, or conducted themselves less by the rules of prudence, than others. Olearius rather apprehends, that the ancient voyagers, viewing certain barbarous people from the coasts, had been imposed on by their uncouth dress; for that the Samogitians, being short of stature, and going in the severity of winter with their heads covered in hoods, seem at a distance as if they were headless. F. Lafitau says, that by Acephali are only meant, people whose heads are sunk below their shoulders. In effect, Hulfius, in his epitome of Sir Walter Raleigh's voyage to Guiana, also speaks of a people which that traveller found in the province of Iripinama, between the lakes of Panama and Cassipa, who had no head or neck; and Hondius, in his map, marks the place with the figures of these monsters. Yet De Laet rejects the story; being informed by other hands, that the inhabitants of the banks of the Caora, a river that flows out of the lake of Cassipa, have their head so far sunk between their shoulders, that many believed they had their eyes in their shoulders and their mouths in their breasts.

ACERNUM, a town of the Picentini (Pliny;) now ACERNO.

ACETITE, a new term used in chemistry to denote the combination of the acetic acid with other substances. The acetites named in the table of Chemical Nomenclature, proposed by De Morveau, Lavoisier, and Fourcroy, are those of pot-ash, soda, lime, ammoniac, lead, and copper.

An instance occurs in the improved method of preparing acetite of lead, formerly called *figar of lead*, communicated to the *Conférence des Mines*, in France, by M. Pontier.

After some historical details, a description of the apparatus required, &c. he proceeds to detail the process in the following way:

"When lead (says he) is almost entirely melted in the iron pot, it is taken out with an iron ladle, and before pouring it out, the ladle is rested upon one of the extremities of the copper pan, from whence, as from a centre, it is made with the hand to describe a semicircular motion, from left to right. By this means the lead is made to lie flat upon the surface of the copper, and it is obtained in plates of the thickness of a millimetre, more or less. These plates are detached by a workman with a pair of pincers, whilst another lades a fresh quantity of lead out of the melting pot, in order to continue the operation. When a sufficient number of these plates have been prepared, they are cut with a hatchet, upon a block of wood, into pieces of different sizes, which are put into the pans of stone-ware. Prepared in this manner, the lead dissolves in the vinegar much more readily than when it has been hammered, the effect of which operation is to bring its particles into closer contact with each other.

"Two or three kilogrammes are put into each of the stone-ware pans, the number of which is regulated according to the quantity of vinegar which we have, and that of the acetite of lead which we intend to prepare.

"To proceed to the distillation of the vinegar—we fill two-thirds of the cucurbit of the alembic with this liquid, and lute the jointings of the apparatus with a paste of rye-flour and water, which is covered with strips of linen or paper; after which we heat the furnace.

* For this purpose we employ, according to the local circumstances, either pit-coal or wood; when we use the latter, there is no necessity for a grate. It is necessary that the water in the recipient should be renewed from time to time during the course of the distillation, lest it should acquire too high a temperature: if there is a cistern, or well in the neighbourhood of the place in which the distillation is carried on, it greatly facilitates this labour.

"The acetic acid which passes over is received into vessels of glass or wood; but as this acid is less volatile than water, the distillation is continued almost to dryness; otherwise a large quantity of it would be lost.

"Into each of the plates, upon which the lead has been placed, about a litre of this acetic acid is poured, after which they are disposed upon shelves, one above the other, in order that, aided by the contact of the air, the oxygenation of the lead may take place. We find a white oxide to be produced upon the surface of the metal that remains above the vinegar: the solution of this oxide is effected by plunging the plates, upon which it has been produced, below the surface of the liquid, whilst we put in their place those which till then had remained immersed. These alternate changes are repeated twice or thrice a day, according to the degree of rapidity with which the plates become oxydized, the elevation of the temperature, the concentration of the acid, and the dryness of the atmosphere. When, by the continued action of the vinegar, these plates have become thinner, and diminished in bulk, new ones are added, in order that the pans may always be full.

"The acetic acid gradually assumes a greyish milky colour, because, in dissolving the oxide of lead, it at the same time carries away some metallic parts, which are detached by the friction. Experience has shewn, that the weaker the vinegar is, the less the lead whitens, and the more considerable becomes the quantity of detached metallic parts; on which account we ought to employ the strongest vinegar that we can procure.

"This liquor is poured into boilers of tinned copper, in which the combination is completed by ebullition, which, by vaporizing the humidity, condenses the particles of the vinegar, and renders them more capable of saturating and dissolving that portion of the lead which before was only suspended in the liquid. The volume of this solution is reduced to two-thirds, and, after having been filtrated, it is put into the other boiler, and evaporated to that point, at which a small quantity of the liquid, when taken out, and suffered to cool, affords crystals. It is then filtrated once more, and put into earthen pans to crystallize.

"The residuum of the first filtration is either distilled in earthen pans with a fresh quantity of lead, or kept for an use of which we shall speak hereafter. Twenty-four hours afterwards, when the crystals have properly deposited themselves, they are taken out, and suffered to dry in the shade; not in the sun, as they easily effloresce. This salt generally forms itself into oblong prisms, more or less white or yellowish, in proportion to the density of the mother-waters in which it has crystallized.

"The mother-water is again put to crystallize, but as it becomes more and more exhausted, the crystals acquire more of the yellow tinge; on which account the manufacturers distinguish two species of salt; the one, greasy to the feel, pulverulent, apt to form into balls, and of a greater specific weight; the other very white, in the form of fine needles, and much lighter than the former, in consequence of its containing none of the mother-water."

After having given a clear explanation of the operations

practised in the manufacture of the acetite of lead, in the southern provinces of France, M. Pontier proposes some important improvements, and concludes his memoir with some remarks on the alterations, which he proposes to be made in the manufacture of salt of lead: he justly considers the process which oxydates and dissolves at the same time the vinegar, to be the most economical; for, in his opinion, it would not be advantageous to dissolve directly the white oxide of lead, both on account of its high price, and the carbonate of lime which it contains, whereby a portion of the vinegar would be saturated and lost. The same, however, would not hold good, in case the lead mines which exist in the country should be wrought, and the metal converted into litharge on the spot: it would then be more advantageous to use it in this state.

ACETOSA (*Encycl.*) Sorrel. According to Linnaeus's method, Sorrel seems more properly ranked in his 22d class, entitled *Diacia*.—Of this genus there are reckoned eight *Species*. 1. The *pratensis*, or common sorrel, grows naturally in pasture-grounds in most places of England and Scotland, &c. requires no description. It is also cultivated in gardens for culinary uses, where it produces large leaves, though it is generally small when growing in the fields. It is a perennial plant, and with proper management will continue many years. Its acid has been found by modern chemists to possess peculiar properties. See *CHEMISTRY*. 2. The *acetifolia*, or sheep's sorrel, grows naturally on dry banks, and on gravelly ground, where by its creeping roots it proves a very troublesome weed, so is not admitted into gardens. It possesses the same medicinal virtues with the former. 3. The *scutata*, round-leaved garden or French sorrel, is a more grateful acid than either of the former; so is preferably cultivated for culinary uses. About Paris it is cultivated in almost as great quantity as any other esculent plant. It has also been much cultivated in England since the introduction of French cookery; being an ingredient in many of their sauces and soups. 4. The *digyna*, or low creeping sorrel, grows naturally in the northern counties of England, Wales, and Scotland. The leaves have very short footstalks, are indented at both ends, and thick in proportion to their size. They grow near the ground, and seldom rise above six inches high. The roots creep in the ground, whereby it multiplies exceedingly in a proper situation. It is sometimes preserved in gardens for the sake of variety, but is not used in the kitchen, though it is applicable to the same purposes with the other species. 5. The *alpina*, or alpine sorrel, is full as hardy as the common, and fitter for the use of the kitchen, as having larger and more succulent leaves, of an equally grateful acid taste. 6. The *vesicaria*, or American annual sorrel, is kept in some gardens for variety, but is not of any use. It is a native of America and Egypt. 7. The *rosea*, or Egyptian sorrel, grows naturally only in that country; it has its name from the bladders of the seeds being of a fine rose colour. 8. The *clunaria*, or sorrel-tree, is a native of the Canary Islands, and rises with a strong woody stalk to the height of 10 or 12 feet. It is frequently kept in Britain in gardens. 9. The *sterilis*, or northern barren sorrel, is used for culinary purposes; and is preferable to the common-kind, very rarely running to seed, and being fit for use all the year round.

ACETUM *Esuriens*, a distilled vinegar, rectified by the help of verdigrise. It obtained this quaint name, because concentrated vinegar creates an appetite.

ACETUM *Radicatum*, is likewise used to denote concentrated vinegar; but Boerhaave thinks the *tartarus regeneratus* is the *acetum radicum* of the old chemists.

ACGIAH-SARAI, a town on the north shore of the Caspian sea.

ACHÆANS; the inhabitants of Achæa Propria, a Peloponnesian state. This republic was not considerable in early times, for the number of its troops, nor for its wealth, nor for the extent of its territories; but it was famed for its probity, its justice, and its love of liberty. Its high reputation for these virtues was very ancient. The Crotonians and Sybarites, to re-establish order in their towns, adopted the laws and customs of the Achæans. After the famous battle of Leuctra, a difference arose betwixt the Lacedæmonians and Thebans, who held the virtue of this people in high veneration, that they terminated the dispute by their decision. The government of the Achæans was democratical. They preserved their liberty till the time of Philip and Alexander. But in the reign of those princes, and afterwards, they were either subject to the Macedonians, who had made themselves masters of Greece, or oppressed by cruel tyrants. The Achæan commonwealth consisted of twelve inconsiderable towns in Peloponnesus. Its first annals are not marked by any great action, for they are not graced with one eminent character. After the death of Alexander, this little republic was a prey to all the evils which flow from political discord. A zeal for the good of the community was now extinguished. Each town was only attentive to its private interest. There was no longer any stability in the state; for it changed its masters with every revolution in Macedonia. Towards the 124th Olympiad, about the time when Ptolemy Soter died, and when Pyrrhus invaded Italy, the republic of the Achæans recovered its old institutions and unanimity. The inhabitants of Patra and of Dymæ were the first assertors of ancient liberty. The tyrants were banished, and the towns again made one commonwealth. A public council was instituted, in which affairs of importance were discussed and determined. A register was appointed to record the transactions of the council. This assembly had two presidents, who were nominated alternately by the different towns. But instead of two presidents, they soon elected but one. Many neighbouring towns which admired the constitution of this republic, founded on equality, liberty, the love of justice, and of the public good, were incorporated with the Achæans, and admitted to the full enjoyment of their laws and privileges.—The arms which the Achæans chiefly used, were slings. They were trained to the art from their infancy, by flinging from a great distance, at a circular mark of a moderate circumference. By long practice they took so nice an aim, that they were sure, not only to hit their enemies on the head, but on any part of the face they chose. Their slings were of a different kind from those of the Bælearians, whom they far surpassed in dexterity.

ACHÆI (Achæans); the inhabitants of Achæa Propria. In Livy, the people of Greece; for the most part called *Ævivi*, by the Roman poets. In Homer, the general name for Grecians. See **ACHÆANS**.

ACHÆMENES, according to Herodotus, was father of Cambyse, and grandfather of Cyrus the first, king of Persia. Most of the commentators of Herodotus are of opinion, that the Achæmenes whom that poet mentions, ode xii. of his 2d book, was one of the Persian monarchs; but, if that were true, he must have reigned before the Medes subdued the Persians; for we do not hear of any king of that name from the time that the Persians founded that great monarchy, which is looked upon as the second universal one. However this be, the epithet *Achæmenians* is frequently given to the Persians, in the old Latin poets.

ACHEMENES, son of Darius I. king of Persia, and brother of Xerxes, had the government of Egypt bestowed on him, after Xerxes had forced the Egyptians to return to their allegiance. He some time after commanded the Egyptian fleet in the celebrated expedition which proved so fatal to all

Greece. The Egyptians having again taken up arms after the death of Xerxes, Achæmenes was sent into Egypt to suppress the rebellion; but was vanquished by Inarus, chief of the rebels, succoured by the Athenians.

ACHÆUS, cousin-german to Seleucus Ceraunus and Antiochus the Great, kings of Syria, became a very powerful monarch, and enjoyed the dominions he had usurped for many years; but at last he was punished for his usurpations in a dreadful manner, in the 140th year of Rome, as related by Polybius.

ACHAIA, a name taken for that part of Greece which Ptolemy calls *Hellas*; the younger Pliny, *Græcia*; now called *Livadia*: bounded on the north by the Thessaly, the river Sperchius, the Sinus Maliacus, and mount Oeta; on the west by the river Achelous; on the east, turning a little to the north, it is washed by the Archipelago, down to the promontory of Sunium; on the south, joined to the Peloponnesus, or Morea, by the isthmus of Corinth, five miles broad. See **LIVADIA**.

ACHAIA PROPRIA, anciently a small district in the north of Peloponnesus, running westward along the bay of Corinth, and bounded on the west by the Ionian Sea, on the south by Elis and Arcadia, on the east by Sicynia: inhabitants, the **ACHÆANS**, properly so called; its metropolis, *Patrae*. It is now called *Romania Alta*, in the Morea.

Achæia was also taken for all those countries that joined in the Achæan league, reduced by the Romans to a province. Likewise for Peloponnesus.

ACHAÏE PRESBYTERI, or the Presbyters of Achæia, were those who were present at the martyrdom of St. Andrew the apostle, A.D. 59; and are said to have written an epistle in relation to it. Bellarmine, and several other eminent writers in the church of Rome, allow it to be genuine; while Du Pin, and some others, expressly reject it.

ACHAIUS, son of Ethwin, was raised to the crown of Scotland after the death of Soluatus, A.D. 788. The Emperor Charlemagne sent an embassy to desire an alliance with him against the English, whose pirates so infested the seas, that the merchants could not carry on their trade. This alliance was concluded in France upon conditions so advantageous to the Scots, that Achaius, to perpetuate the memory of it, added to the arms of Scotland a double field sowed with lilies. He died in 819.

ACHAN, the son of Carmi, of the tribe of Judah, at the taking of Jericho concealed two hundred shekels of silver, a Babylonish garment, and a wedge of gold, contrary to the express command of God. This sin proved fatal to the Israelites, who were repulsed at the siege of Ai. In this dreadful exigence, Joshua prostrated himself before the Lord, and begged that he would have mercy upon his people. Achan was discovered by casting lots, and he and his children were stoned to death. This expiation being made, Ai was taken by stratagem. Josh. vii. 8, 9.

ACHAÏVA, in the Materia Medica of the ancients, the name of an herb much celebrated in many distempers; but we are not assured at present, what is the plant that it truly belongs to. Some have esteemed it, what is called in Egypt *achove*, an herb nearly resembling chamomile, but lower, and with broader leaves, approaching to those of feverfew, and of a faint, but not disagreeable smell. Avicenna seems however to have meant a different plant by this name, and probably the herb we call *MARU-M. Prosper. Alp.*

ACHARACA, anciently a town of Lydia, situate between Tralles and Nyfa; in which were the temple of Plato, and the cave Charonium, where patients slept in order to obtain a cure.

ACHARISTON, from *αχ*, without; and *χαρις*, value; under

this name Galen describes some compositions of singular efficacy, which cured so quickly, that they were undervalued; as the Greek name implies.

ACHATES, the companion of Eneas, and his most faithful friend, celebrated in Virgil.

ACHATES (Sil. Italicus); a river of Sicily, now the *Drillo* (Claverius); which runs from north to south, almost parallel with, and at no great distance from, the Gela; and rises in the north of the territory of Noto. It gave name to the Achates, or Agate, said to be first found there.

ACHAZIB, or ACHIZ, a town of Galilee, in the tribe of Asher, nine miles from Ptolemais.—Also a town in the more southern parts of the tribe of Judah.

ACHELOUS, in fabulous history, wrestled with Hercules, for no less a prize than Deianira, daughter to King Oenus; but as Achelous had the power of assuming all shapes, the contest was long dubious: at last, as he took that of a bull, Hercules tore off one of his horns; so that he was forced to submit, and to redeem it by giving the conqueror the horn of Amalthea, the same with the Cornucopia or horn of plenty; which Hercules having filled with a variety of fruits, consecrated to Jupiter. Some explain this fable, by saying, that Achelous is a winding river of Greece, whose stream was so rapid, that it roared like a bull, and overflowed its banks; but Hercules, by bringing it into two channels, broke off one of the horns, and so restored plenty to the country.

ACHELOUS, a river of Acarnania; which rises in mount Pinus, and, dividing Ætolia from Acarnania, falls from north to south into the Sinus Corinthiacus. It was formerly called *Thos* from its impetuosity, and *king of rivers* (Homer). The epithet *Achelous* is used for *Aqueus* (Virgil); the ancients calling all water *Achelous*, especially in oaths, vows, and sacrifices, according to Ephorus: now called *Alpho Potamo*. Rivers are by the ancient poets called *Tauriformes*, either from the flowing of their waters, or from their ploughing the earth in their course: Hercules, restraining by dykes and mounds the inundations of the *Achelous*, is said to have broken off one of his horns, and to have brought back plenty to the country. See the preceding article.

ACHELOUS, a rivulet of Thessaly, running by the city Lamia (Strabo, Pausanias). Also a river of Peloponnesus, running by Dymæ, in Achaia (Strabo); and by mount Lycæus in Arcadia (Pausanias).

ACHERIL (Luce D'), a learned Benedictine of the congregation of St. Maur, was born at St. Quintin, in Picardy, in 1609; and made himself famous by printing several works, which till then were only in manuscript: particularly, the epistle attributed to St. Barnabas; the works of Lanfrank, archbishop of Canterbury; a collection of scarce and curious pieces, under the title of *Piscilegium, i. e.* Gleanings, in thirteen volumes, quarto. The prefaces and notes, which he annexed to many of these pieces, shew him to be a man of genius and abilities. He had also some share in the pieces inserted in the first volumes of The acts of the saints of the order of St. Bennet, the title whereof acquaints us that they were collected and published by him and father Mabillon. After a very retired life, till the age of 73, he died at Paris the 29th of April, 1685, in the abbey of St. Germain in the fields, where he had been librarian.

ACHERON, a river of Epirus. The poets feigned it to have been the son of Ceres, whom the hid in hell for fear of the Titans, and turned into a river, over which souls departed were ferried in their way to Elysium.

ACHERON, a river of Thesprotia, in Epirus; which, after forming the lake Acherusia, at no great distance from, falls into the sea near, the promontory of Chimerium, to the west of the Sinus Abracius, in a course from north to south.

ACHERON, or ACHEROS, a river of the Brutii in Italy running from east to west; where Alexander king of Epirus was slain by the Lucani, being deceived by the oracle of Dodona, which bid him beware of Acheron.

ACHERUSIA PALUS, a lake between Cumæ and the promontory Misenum, now it *Lago della Colliccia* (Claverius). Some confound it with the *Lacus Lucrinus*, and others with the *Lacus Averni*. But Strabo and Pliny distinguish them. The former takes it to be an effusion, exundation, or washes of the sea, and therefore called by Lycophron, *Αχχουσια χροις*.—Also a lake of Epirus, through which the Acheron runs.—There is also an *Acherusia*, a peninsula of Bithynia on the Euxine, near Heraclea; and a cave there of the same name, through which Hercules is said to have descended to hell to drag forth Cerberus.

ACHIA, a kind of cane that grows in the East Indies, which is pickled green in the country, with strong vinegar, pepper, and some other spices and ingredients. This pickle comes to Europe in a sort of earthen jars, about a foot high, and the same in breadth, growing narrower at the mouth. The bits of cane are an inch and a half in diameter, and a little above two inches long, almost of the same consistency with pickled cucumbers. They are of a pale yellow colour; and, instead of pulps, their inside is a close, fibrous substance, like that of the common canes when the outside coat is off. The Dutch bring home great quantities of this pickle, which their cold climate makes them think wholesome. They generally eat it towards the end of their meals, judging it very good to quicken the appetite and strengthen the stomach.

ACHILLEA (*Eucyl.*) YARROW, MILFOIL, or NOSE-BLEED. Of this plant the principal species are, 1. The *millefolium*, or common yarrow, is found naturally on banks, and by the sides of foot-paths, in most parts of England. It most commonly bears white flowers, though a variety of it is found which bears purple ones. These however do not long continue to bear flowers of this colour, if transplanted into gardens. It becomes a troublesome weed where it is once allowed to get a footing. The cultivation of it is recommended by Mr. Anderson, in his *Essays on Agriculture*, as a proper food for cattle. 2. The *sanctolina*, or eastern fieseezwort, is sometimes cultivated in gardens; it has large yellow flowers, which stand upon pretty long footstalks placed singly, not in bunches as in the common kind. It has leaves like lavender-cotton, which, when rubbed, emit a strong oily odour. The flowers appear in June and July. 3. The *tomentosa*, or woolly yarrow, is a native of the south of France and Spain, but lives in the open air in England. The flowers are of a bright yellow, and continue long in beauty, growing in clusters at the top of the stalks, which seldom rise above a foot high. The leaves are finely cut, and very hoary. 4. The *abrotanifolia*, or tall eastern yarrow, is a native of the islands in the Archipelago: it grows to the height of two feet and a half, with large umbels of yellow flowers on the top; the leaves resemble those of the common wormwood, and are cut into long narrow segments. 5. The *clavenna*, or Alpine umbelliferous wormwood, takes its name from the mountains of which it is a native. It seldom grows above six or seven inches in height; it supports umbels of white flowers, like those of the common fieseezwort, which appear in April and May. The leaves are silvery, and shaped like those of wormwood, which often decay in the autumn and winter. 6. The *tanacetifolia*, or eastern fieseezwort, with tansey leaves, is a very humble plant, seldom rising above six inches in height. The flowers are nearly as large as those of the common fieseezwort, white, and growing in flat umbels. They appear in June and July. The leaves of the plant have some likeness to those of the common wormwood, are very hoary, grow close to the ground, and decay in au-

turn to so as to make little appearance in winter. Like the last species, this is a native of the Alps. 7. The *ageratum*, or sweet maudlin, formerly much used in medicine and for culinary purposes. The common maudlin flowers in June and July, and the seeds are ripe in September. 8. The *Egyptiaca*, or hoary sneezwort, is a native of the Archipelago. It hath very hoary leaves, which remain all the year; and the plants growing close and low, make a pretty appearance at all seasons. The flowers are yellow, and are produced in umbels on the top of the stalks; they appear in June, and continue till the end of September. 9. The *platnica*, or common sneezwort, grows wild. There is a variety, however, with double flowers, commonly known by the name of double maudlin. This species creeps greatly by the roots, so as soon to overspread a large spot of ground. If planted in pots, so as to confine its roots from creeping, the stalks grow close together, and make a tolerable appearance when in flower. 10. The *macrophylla*, or Alpine sneezwort, with few leaves, is a native of the Alps. It produces many stalks rising near three feet high; having loose branching umbels of white flowers on their top, resembling those of the common sneezwort, but larger. 11. The *nana*, or hoary Alpine milfoil, is likewise a native of the Alps; the leaves are hoary, and the umbels of its flowers are more compact than the former: the stalks do not rise more than a foot high. 12. The *nobilis*, or sweet milfoil (see Pl. 6.), approaches to the nature of the common milfoil; but its leaves are of a paler green, and are neither so long nor so much cut off as those of the common milfoil are: they have a strong sweet scent when bruised. 13. The *alpina*, or white maudlin, bears some resemblance to the common sneezwort; but the leaves are longer, of a deeper green colour, and deeply indented in their edges; the flowers are white, and the roots creep far under ground. The plant will rise, in good land, to the height of four feet.

ACHILLEA, a name frequently given by the ancients to the gum called dragons-blood.

ACHILLES (*Encycl.*). He was a native of Phthia, in Thessaly; and, according to the poets, his mother fed him by day with ambrosia, and by night covered him with celestial fire. She dipped him also in the waters of the river Styx, by which his whole body became invulnerable, except that part of his heel by which she held him; and afterwards intrusted him to the care of the centaur Chiron, who, to give him the strength necessary for martial toil, fed him with honey, and the marrow of lions and wild boars, &c. To prevent his going to the siege of Troy, she disguised him in female apparel, and hid him among the maidens at the court of King Lycomedes: but Ulysses discovering him, persuaded him to follow the Greeks. Achilles distinguished himself by a number of heroic actions at the siege. Being disguised, however, with Agamemnon for the loss of Briseis, he retired from the camp. But returning to avenge the death of his friend Patroclus, he slew Hector, fastened his corpse to his chariot, and dragged it round the walls of Troy. At last Paris, the brother of Hector, wounded him in the heel with an arrow, while he was in the temple treating about his marriage with Philoxena, daughter to King Priam. Of this wound he died, and was interred on the promontory of Sigæum; and after Troy was taken, the Greeks sacrificed Philoxena on his tomb. It is said, that Alexander, seeing this tomb, honoured it by placing a crown upon it; at the same time crying out, that "Achilles was happy in having, during his life, such a friend as Patroclus; and, after his death, a poet like Homer."

ACHILLES, a name which the schools give to the principal argument alleged by each sect of philosophers in behalf of their system. In this sense we say, this is his Achilles; that is, his master proof; alluding to the strength and im-

portance of Achilles among the Greeks. Zeno's argument against motion, is peculiarly termed Achilles.—That philosopher made a comparison between the swiftness of Achilles, and the slowness of a tortoise: arguing, that if the tortoise were one mile before Achilles, and the motion of Achilles 100-times swifter than that of the tortoise, yet he would never overtake it. But this sophism is easily solved, by expressing the whole relative distance run by the tortoise before Achilles overtook him, by the following series, $\frac{1}{100} + \frac{1}{10000} + \frac{1}{1000000}$, &c. the sum of which is $\frac{1}{99}$ of a mile; and the distance run by Achilles is one mile more; so that when Achilles had run $1\frac{1}{99}$ of a mile, he would have overtaken the tortoise.

ACHILLINI (Alexander), born at Bologna, and doctor of philosophy in that university. He flourished in the 15th and 16th centuries, and by way of eminence was styled the Great Philosopher. He was a steadfast follower and accurate interpreter of Averroes upon Aristotle, but most admired for his acuteness and strength of arguing in private and public disquisitions. He made a surprising quick progress in his studies, and was very early promoted to a professorship in the university, in which he acquitted himself with so much applause, that his name became famous throughout all Italy. He continued at Bologna till the year 1506; when the university of Padua made choice of him to succeed Antonio Francatiano in the first chair of philosophy, and his fame brought vast numbers of students to his lectures at Padua: but the war, wherein the republic of Venice was engaged against the league of Cambray, putting a stop to the lectures of that university, he withdrew to his native country, where he was received with the same marks of honour and distinction as before, and again appointed professor of philosophy in Bologna. He spent the remainder of his life in this city, where he died, and was interred with great pomp in the church of St. Martin the Great, which belongs to the Carmelite friars. Jovius, who knew Achillini, and heard his lectures, says; that he was a man of such exceeding simplicity, and so unacquainted with address and flattery, that he was a laughing-stock to the pert and saucy young scholars, although esteemed on account of his learning. He wrote several pieces on philosophical subjects, which he published, and dedicated to John Bentivoglio.

ACHILLINI (Claudius), grandson of the former, read lectures at Bologna, Ferrara, and Parma; where he was reputed a great philosopher, a learned divine, an excellent lawyer, an eloquent orator, a good mathematician, and an elegant poet. He accompanied Cardinal Ludovino, who went as legate into Piedmont; but being afterward neglected by this cardinal, when he became pope under the name of Gregory XV. he left Rome in disgust and retired to Parma; where the duke appointed him professor of law, with a good salary. He published a volume of Latin Letters, and another of Italian poems, which gained him great reputation: he died in 1640, aged 66.

ACHIOITE, or ACHIOITY (*Encycl.*). The same with what the French commonly call *Rocou*, and the Dutch *Orleanse*. It has been commonly esteemed a kind of argilla, or earth; but later observers find it a flower, or seed of a tree, which grows chiefly in very hot countries, as Yucatan or Campechy, and Guatimala. It is about the size of a plum-tree, only more tufted; its branches being longer than the trunk. The fruit is inclosed in a rind like a chestnut, except that it is of an oval figure. It begins to open cross-wise from the middle to the top; and subdivides into four parts, having in the middle a beautiful carmine-coloured flower. The tree has no leaves; but instead thereof shoots out filaments like those of saffron, only bigger and longer. Between these

Surio, or Surgeon.

Huso or Singlasp Fish.

*Apparatus for the distillation
of ACIDS.*

Scale 1 In. to a Foot.

grow little soft vermilion-coloured grains, about the size of pepper-corns; which the Indians, separating from the filaments, bake in cakes of about half a pound each; in which form the drug is brought into Europe. The poor people use Achiotte instead of saffron: others mix it as an ingredient in chocolate, during the grinding of the cacao, the quantity of two drams to a pound, to give it a reddish colour, &c.; though this practice was formerly more frequent than at present; the opinion of its being an earth, which even Mr. Ray fell into, having discredited its use. Some also use it to dye wax of a vermilion colour. F. Labat describes the achiotte somewhat differently; especially the preparation of it for dyeing. The tree, according to him, produces yearly its crops of flowers, of a carnation colour, not unlike wild roses. These are succeeded by a kind of rough pods, or fruit resembling chestnuts, full of small grains; which being fermented in water, and this water afterwards passed through a caribbe sieve, it contracts a red colour. It is then boiled, scummed, set on the fire again, and stirred; till at length it thickens, and will fall loose from the spatula; which is the achiotte or rocou in perfection; though to make it more beautiful, they have two further processes, which are described by F. Labat. According to Savary, to procure the achiotte, they shake out the grains in an earthen vessel, soak and then wash them in several repeated warm waters, till they have discharged all their vermilion colour: after which, letting the water stand to settle, the fecula at the bottom is taken and formed into little cakes and balls; which when pure and not adulterated either with red earth or fine brick-dust, are highly valued. Some also use fire to boil the achiotte, and give it a farther consistence.

ACHISH, king of Gath, to whom David retired; and who gained a complete victory over Saul, which was fatal both to that prince and his son Jonathan.

ACHTOPHEL, a counsellor, who, revolting from David king of Israel, sided with his rebellious son Abialom; to whom he gave crafty advice, which not being complied with, he hanged himself.

ACHLAR, a river of the greater Armenia, otherwise called *Aras*, *Caucæ*, and by the ancients *Araris*.

ACHMET, son of Sarim, has left a book concerning the interpretation of dreams according to the doctrine of the Indians, Persians, and Egyptians, which was transcribed out of Greek into Latin by Leo Tuscus in 1160. He lived in the 9th century.

ACHMET GEDUC, a famous general under Mahomet II. and Bajazet II. in the 15th century. When Mahomet II. died, Bajazet and Zezan both claimed the throne: Achmet sided with the former, and by his bravery and conduct fixed the crown on his head. But Bajazet took away his life; shining virtue being always an unpardonable crime in the eyes of a tyrant.

ACHOR, a valley of Jericho, lying along the river Jordan, not far from Gilgal; so called from Achan, the troubler of Israel, being there stoned to death.

ACHOR (*Encycl.*), in medicine, Trallian says, is a sore on the outside of the head, full of little perforations, which discharge a humour like ichor, whence its name. He further says, that the orion resembles an achor; but that the mouths of the perforations are larger, resembling the cells of a honey-comb, whence the name; the matter is also nearly of the consistence of thin honey. When these discharges spread, the serum which oozes out dries, and forms a scab.—The achor differs from the favus and tineæ only in the degree of virulence. It is called *favus* when the perforations are large, and *tineæ* when they are like those which are made by moths in cloth. But generally, by *tineæ* is understood a dry scab on

the hairy scalp of children, with thick scales and an offensive smell. When this disorder affects the face, it is called *crusta lactea*; which, when it happens to children, if in other respects they are healthy, the best treatment, besides keeping the belly moderately lax, is anointing the part now and then with *Ung. hydrarg. nitrat.* Attention should also be paid to cleanliness and a moderate diet. An issue may be made and continued, keeping the hair short and washing the head with soap suds.—Some cases are very difficult of cure, and attended with violent itching, a pale countenance, &c. but still the same method generally succeeds in all the species and degrees of virulence. Small doses of calomel may be given as an alternative, rather than as a laxative; and the vin. antim. in such doses, at proper intervals, as the stomach will easily retain. Externally, the *unguent à pice* may also do good, or cream mixed with salt in fine powder. If the humour is repelled, give warm fomentities until it return. Writers of medical observations afford divers anomalous instances of *achores*, viz. Some found even in aged people; some not on the head, but the feet; others resembling the venereal disease; others which disappeared upon cutting the hair, and returned on its growing anew; others followed by a thickness of hearing, others by panics, and others by a gutta serena. Their drying up has sometimes been followed by a fever, their repulsion inwards by an epilepsy.

ACHRADINA (Plutarch, Cicero, Livy); one of the four cities or divisions of Syracuse, and the strongest, largest, and most beautiful part of it; separated by a very strong wall from the outer town, *Tyche* and *Neapolis*. It was adorned with a very large forum, with beautiful porticos, a most elegant prytæneum, a spacious senate-house, and a superb temple of Jupiter Olympius. (Plutarch.)

ACHRAS (*Encycl.*). In Vol. I. a botanical error (repeated also in some succeeding instances) has occurred: Monogynia order, and hexandria class, is there too obvious a blunder to pass unobserved by the botanist; and too obvious indeed to require, on our part, minute correction in every instance.

ACIDALUS, a fountain in Orchomenus a city of Boeotia, in which the Græces, who are sacred to Venus, bathed. Hence the epithet *Acidulia*, given to Venus (Virgil).

ACIDS (*Encycl.*). To this article we are induced to add an account of an apparatus for the distillation of acids and other substances; the invention of the ingenious translator of Berthollet's Elements of the Art of Dyeing, and by him annexed to that work. See Plate 10.; where A represents the retort, the neck of which is ground into and passed through the thick stopper B; represented below separately at *b*; with its ground stopper *a*, which may be put in when the neck of the retort is withdrawn. The external part of the stopper B is accurately ground into the wide neck of the receiver C, the narrow neck of which is ground into the wide neck of the receiver D, the narrow neck of which is ground into that of the receiver E; in the receiver D there is also another aperture in its superior part, into which the tube H, open at both ends, is fitted by grinding, so that its lower extremity may reach to the lowermost part of the receiver; and consequently be immersed in any fluid that may be contained in it. Into the small neck of the receiver D, there is also ground a crooked tube I, forming a little more than one fourth of a circle, open at both ends, and extending to very near the lower part of the receiver E, the small neck of which receives a similar crooked tube K; and is received into the wider neck of K, which receives the tube L in like manner; and is received into G; the narrow neck of which also receives a crooked tube M N, open at both ends, and bent as represented in the plate; so as to convey any aerial fluid into the small inverted cup, where it is collected and directed to pass by

the hole represented in the plate, into one of the four inverted bottles placed above it, by means of the moveable frame P; which having four notches to retain the bottles in an upright inverted position, is moveable on the centre support kept steady by means of a heavy leaden foot, in the centre of a flat pan of water, which covers the mouths of the bottles. The water which issues from the bottles when the air is introduced, and which would make the pan overflow, is directed by a notch in its lip, and the pipe Q into the bucket R placed under the frame, which raised upon four legs serves to support the whole apparatus, the different parts of which being successively applied to each other, beginning with the receiver C, are kept in a fixed position by slips of wood hollowed out so as to fit the curvature of the receivers, as represented below detached at S s. Heat is applied to the matter contained in the retort A, by means of the lamp placed below it, which is upon Mr. Argand's principle, and a very useful acquisition to the laboratory: of this 1 represents the chimney, which is most conveniently made of thin metal, as brass, copper, or common tinned iron plate; which being opaque, the flame of the lamp within is not seen. Metallic chimneys are preferred, because they are not liable to be broken, and because it is the heat and not the light which is here wanted; 2 is the bent wire serving to elevate, or depress the wick; 3, the reservoir for the oil; 4 the support of this, with a small cup to receive the oil which may drop from within the wick without being consumed; 5 a pin with its screw for fixing the lamp at any distance from the retort."

The use and advantages of this apparatus are thus explained by the inventor.

"In the plate, the apparatus is represented as employed in the distillation of a substance, the vapours of which condense with difficulty, such as the oxygenated marine acid. Let it be supposed then that the common salt, and calx or oxyd of manganese, have been put into the retort: the vitriolic acid is next introduced by means of a retort funnel; and this being withdrawn, the neck of the retort is immediately introduced into the stopper B, the other parts of the apparatus being previously disposed as in the plate. The lamp is then brought under the retort, but at a moderate distance, that the retort may not be cracked by the too sudden application of the heat, nor the vapours be driven over too rapidly into the receivers. As soon as the heat is applied, the salt is rendered fluid by the vitriolic acid, and the marine acid getting pure air from the manganese, begins to pass over into the receiver C, in the state of oxygenated marine acid: into this, no water has been put, in order that the vapours of the common marine acid may here be condensed separately. The vapours of the oxygenated acid meeting with no water here, pass into the receiver D, where a small quantity is put, by which a part is condensed, but another part passes over into the receiver E; but for this purpose it must go through the tube I to the bottom of the water which is placed in that receiver, and that part which is not condensed there, must rise up through it in bubbles, as represented in the plate: these, circulating in the receiver E if not condensed, will pass through K, and the water in F into its upper part, and in like manner to L, where if not condensed, they will be conveyed through the tube M N by means of the cup into the bottles, each of which will in its turn be brought over the little cup, while the others being filled with the air, will be removed and replaced by fresh ones filled with water, without any loss of the air, or interruption to the process: at the same time all inconvenience from the overflowing of the water will be obviated by the tube Q. To those who have been accustomed to employ the different kinds of apparatus hitherto in use for the distillation of the acids, particularly the marine acid, I conceive the ad-

vantages of this will be sufficiently evident; but to those who have had little or no experience in this respect, it may not be improper to mention a few particulars. First then, in this apparatus, there is no necessity for having the retort tubulated, for the neck of the retort being ground into the stopper B, is as easily introduced into that while fitted into the first receiver, as the stopper would be into the superior opening in the retort. This joint is more likely also to be close, as the neck of the retort is expanded when heat is applied, rather sooner than the orifice into which it is inserted, because it is to the retort that the heat is more immediately applied; whereas in the tubulated retort, the reverse of this takes place, the opening being in the retort itself, and the stopper being foreign, and heated only through the medium of the retort. The neck of the retort is ground into the piece B, and not into the receiver C, because the retorts being much more frequently broken, the neck of this receiver would soon be worn out by the grinding; besides in this way, when the retort is broken, the receiver being large, is not so conveniently ground as the piece B, and it is also in this way constantly preserved clean, and never dirtied by the sand or other substances used in grinding. In the receiver D, there is the tube H, which being open at both ends, but having its lower extremity immersed in the water, allows a passage for the atmospheric air downwards, when the vapour is suddenly condensed by the diminution of heat; but prevents the escape of the vapour upwards: for when the vapour presses on the surface of the fluid in D with an increased force, a column of the fluid there, is raised in the tube, which is somewhat more than equal in height to the perpendicular altitude of the immersed part of all the other tubes taken together.

"This tube, which has been called a tube of safety, is an useful addition to the apparatus, and is said to be the invention of a Mr. Welter. In Mr. Lavoisier's apparatus there is one to each of the bottles, but this does not appear to me to be necessary, as the absorption is never rapid except in the retort, and the first, or at most, the two first receivers; and in the apparatus here represented, there is no crooked tube between the first and second receiver, which might convey the liquor of the second into the first receiver. When only one tube is employed, the quantity of fluid at first put into D should be but small, as a part of that from E may possibly pass over into D.

"This apparatus has many advantages over any that I have seen. Its joints are ground instead of being luted, and I always find that the purity of the product is injured by lute, either during the operation, or when the product is removed: as all the joints are concentric, they are easily ground; the joints are very strong: many of the joints cover others, so that some of them may be bad without much injury to the apparatus; any of the joints of the tubes I, K, L, for instance, may be bad, with very little inconvenience, as any person may be convinced by leaving any of the tubes a little loose. When a moderate degree of heat only is required, we have no occasion for a furnace, a lamp answering the purpose of one completely, and indeed having several advantages over it.

"For first, we have the heat more immediately in our power, as we can raise, or lower, or remove it altogether, by merely changing the elevation of the lamp; and we have an easy rule for this management of the heat, in the velocity with which the air bubbles pass through the fluid in the different receivers, and in the height of the fluid in the tube H. It may not be improper to remark, that when the heat is suddenly removed, if the diameter of the tube H be small, it will be proper to blow a little air through it, lest the water should get into the receiver D from E.

" Secondly, it enables us to estimate the weight of the products at any time during an operation: the weight of the retort and ingredients having been previously noted, we can at any time during the process that we judge proper, remove the retort, stopping the hole from which it was withdrawn with the small stopper *a*, weigh it and return it (this need not take up more than half a minute), and in the difference of the weights, we have the weight of the product.

" In every case where the lamp is suddenly withdrawn while the retort is hot, and always when an operation is finished, it will be proper to surround the retort with a quantity of dry tow, flannel, or any other rare substance which transmits heat very slowly, that it may not be cracked by the sudden change of temperature: another circumstance which should be attended to, in order to prevent the breaking of the retort, is, that its neck should be placed with such a degree of inclination, as to allow the drops formed in it by the condensed steam, to run freely into the receiver; as if they should fall back, when the residuum in the retort is growing dry, they will certainly crack the hot glass. In the apparatus which the annexed plate represents, this end is accomplished by inclining the support of the whole apparatus as there represented; but it may be done in a way which I have adopted, since that drawing was made, and which seems preferable in some respects, particularly in this, that it admits of the support being horizontal, which enables us to put more water into the receivers. The retort is made to incline by the hole in the piece *B*, which receives its neck passing obliquely through it, so as to make the end of the retort within the receiver, to dip considerably, while its own external part ground into the receiver *C*, is in a horizontal position: it is perhaps needless to add, that by varying the shape of the receivers, their effect may in some measure be varied; thus, by making them of an elliptical shape instead of globular, if the short axis of the ellipses be placed horizontally, we may proportionally increase the pressure of the condensed vapour on the surface of the fluid they contain, whereas, if the long one be placed in that direction, we may increase the surface of the fluid exposed to its action. It seems also unnecessary to observe, that if the use of a furnace be preferred to that of the lamp, all the other advantages of the apparatus remain the same: and if the retort be of a large size, that a furnace must necessarily be employed, as the neck of the retort might not be able to support the weight of the matter it contained."

ACIDALIUS (Valens), would, in all probability, have been one of the greatest critics in these latter ages, had he lived longer to perfect those talents which nature had given him. He was born at Wittkock, in Brandenburg; and having visited several academies in Germany, Italy, and other countries, where he was greatly esteemed, he afterwards took up his residence at Breslaw, the metropolis of Silesia. Here he remained a considerable time, in expectation of some employment; but nothing offering he turned Roman-catholic, and was chosen rector of a school at Niesla. It is related, that about four months after, as he was following a procession of the host, he was seized with a sudden phrenzy; and being carried home, expired in a very short time. But Thuanus tells us, that his excessive application to study was the occasion of his untimely death; and that his sitting up a-nights in composing his Conjectures on Plautus, brought upon him a distemper which carried him off in three days, on the 25th of May, 1595, being just turned of 28. He wrote a Commentary on Quintus Curtius; also, Notes on Tacitus, on the Twelve Panegyrics; besides speeches, letters, and poems. His poetical pieces are inserted in the *Deliciae* of the German poets, and consist of epic verses, odes, and epigrams. A little

piece, printed in 1593, under the title of *Mulieris non esse homines*, "That women were not of the human species," was falsely ascribed to him. But the fact was, that Acidalius happening to meet with the manuscript, and thinking it very whimsical, transcribed it, and gave it to the bookseller, who printed it. The performance was highly exclaimed against, inasmuch that the bookseller being seized, he discovered the person who gave him the manuscript, and a terrible outcry was made against Acidalius. A story goes, that being one day to dine at a friend's house, there happened to be several ladies at table, who supposing him to be the author, were moved with so much indignation, that they threatened to throw their plates at his head. Acidalius, however, ingeniously diverted their wrath. In his opinion, he said, the author was a judicious person, the ladies being certainly more of the species of *angels* than of *men*.—Mr. Baillet has given him a place among his *Enfants Célèbres*; and says, that he wrote a comment upon Plautus when he was but 17 or 18 years old, and that he composed several Latin poems at the same age.

ACIDULÆ. Mineral waters that contain a brisk spirit, when unaccompanied with heat, are thus named; but if they are hot also, they are called *thermae*.

ACILA (Strabo); OCILA (Pliny); and OCELIS (Ptolemy); a staple or mart town in Arabia Felix, on the Arabian gulf, from which, according to Pliny, they set sail for India. Now Ziden.

ACILIUS GLABRIO (Marcus), consul in the year of Rome 562, and 211 years before the Christian æra, distinguished himself by his bravery and conduct in gaining a complete victory over Antiochus the Great, king of Syria, at the Straits of Thermopylæ in Thessaly, and on several other occasions. He built the Temple of Piety at Rome, in consequence of a vow he made before the above-mentioned battle; and the reason of his giving it that name, is very remarkable. The story is mentioned by Pliny, Valerius Maximus, and others.

ACINIPPO, a town of Bætica (Pliny); its ruins, called *Romla la Vega*, are to be seen near Arunda, in the kingdom of Granada.

ACIS, in fabulous history, the son of Faunus and Simelethis, was a beautiful shepherd of Sicily, who being beloved by Galatea, Polyphemus the giant was so enraged, that he dashed out his brains against a rock; after which Galatea turned him into a river, which was called by his name.

Acis (Ovid, Theocritus); a river of Sicily, running from a very cold spring, in the woody and shady foot of mount Ætna, eastward into, and not much above a mile from, the sea, along green and pleasant banks, with the speed of an arrow, from which it takes its name. It is now called *Sci Iaci*, or *Chinci*, according to the different Sicilian dialects: Antonine calls it *Actus*. Also the name of a hamlet at the mouth of the *Acis*.

ACOMINATUS (Nicetas), was secretary to Alexius Comnenus and to Isaacus Angelus successively: he wrote an history from the death of Alexius Comnenus in 1118, where Zonaras ended his; to the year 1203, which has undergone many impositions, and is much applauded by the best critics.

ACONITUM (*Encycl.*). See a figure of this poisonous plant in Plate 10.

ACONITUM Hyemale. See HELLEBORUS.

ACONTIUS (James), a philosopher, civilian, and divine, born at Trent, in the 16th century: he embraced the reformed religion; and, coming into England in the reign of Queen Elizabeth, was much honoured by her, which he acknowledged in a book dedicated to that queen. This work is his celebrated Collection of the Stratagems of Satan, which has been so often translated, and borne so many editions.

ACOUSTICS (*Encycl.*), the science which instructs us in the nature of sound, is divided by some writers into DIACOUSTICS, which explains the properties of those sounds that come directly from the sonorous body to the ear; and CATACOUSTICS, which treats of reflected sounds: but such distinction does not appear to be of any real utility.

ACQUA-CHE-TAVELLA, a celebrated fountain of Italy, in Calabria Citerior, a province of Naples. It is near the mouth of the river Crata, and the ruins commonly called *Sibari Rovinata*. It has been said to beautify those who washed in it.

ACRA (Josephus); one of the hills of Jerusalem, on which stood the lower town, which was the Old Jerusalem; to which was afterwards added Zion, or the city of David. Probably called *Acra*, from the fortrefs which Antiochus built there, in order to annoy the temple, and which Simon Maccabæus took and razed to the ground.

ACRA JAPYGINA (Pliny); *Salentina* (Ptolemy); now *Capo di Santa Maria di Leuca*; a promontory in the kingdom of Naples, to the south-east of Otranto, where formerly was a town, now lying in ruins, on the Ionian sea, over against the Montes Acroceranunii of Epirus.

ACRÆ, in the ancient geography, a town of Sicily, whose inhabitants were called *Acreses*. It stood to the south of Syracuse, at the distance of 24 miles, near the place now called the monastery of *Santa Maria d'Arcia*, on an eminence, as appears from Silius Italicus. The Syracusans were the founders of it, according to Thucydides, 70 years after the building of Syracuse, or 665 before Christ. Hence the epithet *Acraus*.

ACRAGAS, or AGRAGAS (anc. geog.), so called by the Greeks, and sometimes by the Romans (Virgil); but more generally *Agrirentum* by the latter; a town of Sicily. In Greek Medals the inhabitants are called *AKPITANTINOI*, and *Agrirentini* by Cicero. The town stood upon a mountain, at the confluence of the Acragas and Hypsa, near the port called *Eutæque* by Ptolemy, but *Estænos*, or the Dock, by Strabo; and in the time of the latter, scarce a trace of all that side remained. In the year before Christ 584, the people of Gela built Acragas, 108 years after building their own city. It took its name from the river running by it; and being but two miles from, enjoying all the conveniences that could come by, the sea. It was a place of great strength, standing on the top of a very steep rock, and washed on the south side by the river Acragas, now called *Fiume di Gergenti*, and on the south-west by the Hypsa, with a citadel to the south-east, externally surrounded by a deep gulf, which made it inaccessible but on the side next the town. It was famous for the tyrant Phalaris and his brazen bull. They were a people luxurious in their tables, and magnificent in their dwellings; of whom Empedocles, in Diogenes Laertius, says, that they lived to-day as if they were to die to-morrow, and built as if they were to live for ever. The country round the city was laid out in vine and olive yards, in the produce of which they carried on a great and profitable commerce with Carthage. E. long. 13. 30. Lat. 37. 20.

ACRATH (anc. geog.), a place in Mauritania Tingitana (Ptolemy); now supposed to be *Velex de Gomara*; a fortified town in the kingdom of Fez, with a citadel and commodious harbour on the Mediterranean, scarce a mile distant from Penon de Velex, a Spanish fort. W. Long. 5. Lat. 34. 45.

ACRIBEA, a term purely Greek, literally denoting an exquisite or delicate accuracy; sometimes used in our language for want of a word of equal signification.

ACRIDOPHAGI (*Encycl.*) Though the circumstances of these people, as related by Diodorus Siculus, should be deemed fabulous, yet may the *acridophagia* be true. It is well known, that to this day the inhabitants of Ethiopia, Arabia,

&c. frequently use locusts as food. The reader will not be displeased if we lay before him the result of Dr. Hædeltquitt's enquiries as to this particular, who travelled in Syria and Egypt so late as the year 1752. This ingenious gentleman, who travelled with a view to improve natural history, informs us, that he asked Franks, and many other people who had lived long in these countries, whether they had ever heard that the inhabitants of Arabia and Ethiopia, &c. used locusts as food. They answered that they had. He likewise asked the same question of Armenians, Cophtes, and Syrians, who lived in Arabia, and had travelled in Syria and near the Red-sea; some of whom said they had heard of such a practice, and others that they had often seen the people eat these insects. He at last obtained complete satisfaction on this head from a learned sheik at Cairo, who had lived six years in Mecca. This gentleman told him, in presence of M. le Grand, the principal French interpreter at Cairo, and others, that a famine frequently rages at Mecca when there is a scarcity of corn in Egypt, which obliges the inhabitants to live upon coarser food than ordinary: That when corn is scarce, the Arabians grind the locusts in hand-mills, or stone-mortars, and bake them into cakes, and use these cakes in place of bread: That he has frequently seen locusts used by the Arabians, even when there was no scarcity of corn; but then they boil them, stew them with butter, and make them into a kind of fricasse, which he says is not disagreeably tasted, for he had sometimes tasted these locust-fricassees out of curiosity. From this account, we may see the folly of that dispute among the divines about the nature of St. John's food in the wilderness: some maintaining the original word to signify the fruits of certain trees; others, a kind of birds, &c.: but those who adhered to the literal meaning of the text were at least the most orthodox, although their arguments were perhaps not so strong as they might have been, had they had an opportunity of quoting such an author as Hædeltquitt.

ACRISIUS, king of Argos (fab. hist.), being told by the oracle that he should be killed by his grandchild, shut up his only daughter Danae in a brazen tower: but Jupiter coming down in a golden shower, begot Perseus upon her: after Perseus had slain the Gorgons, he carried Medusa's head to Argos; which Acrisius seeing, was turned into a statue.

ACRITAS (anc. geog.), a promontory of Messenia, near Methone (Ptolemy); running into the sea, and forming the beginning of the bay of Messene. Now called *Capo di Gallo*, between Methone to the west, and Corone to the east, where the Sinus Coroneus begins.

ACROATHOUM, or ACROTHOUM (anc. geog.), a town situated on the top of mount Athos, where the inhabitants, according to Mela, were longer lived by half than in any other country: called by the modern Greeks, *Άγιος ορος*; by the Italians, *La Cima di Monte Santo*.

ACROCERAUNIA, or MONTES CERAUNII (anc. geog.), mountains running out into the sea (so called from their being often thunder-struck; separating the Ionian sea from the Adriatic; where Illyria ends and Epirus begins (Horace); now called *Monti della Chimera*.

ACROCORINTHUS (anc. geog.), a high and steep hill, hanging over the city of Corinth, which was taken within the walls, as an acropolis, or citadel. On its top stood a temple of Venus; and lower down issued the fountain Pyrene, yielding not a plentiful, but a clear stream of water (Pliny).

ACRON, a celebrated physician of Agrirentum, who first thought of lighting large fires, and purifying the air with perfumes, to put a stop to the pestilence that ravaged Athens, and which was attended with success. He lived about four hundred and seventy-three years before the Christian æra.

ACROPOLIS (anc. geog.), the citadel, and one of the divi-

mons, of Athens; called *Polis*, because constituting the first and original city; and the *Upper Polis*, to distinguish it from the Lower, which was afterwards built round it in a large open plain; and hence its name (Pausanias). To the north it had a wall, built by the Pelasgi, and therefore called *Pelasgic*; and to the south a wall, by Cymon the son of Miltiades, out of the Persian spoils, many ages after the building of the north wall (Plutarch). It had nine gates, and was therefore called *Enneapylon*; yet but one principal gate or entrance, the ascent to which was by a flight of steps of white marble, built by Pericles with great magnificence (Plutarch).

ACROPOLITA (George), one of the writers of the Byzantine history, was born at Constantinople, in the year 1220, and brought up at the court of the emperor John Ducas at Nice. He was employed in the most important affairs of the empire; being sent ambassador to Larissa, to establish a peace with Michael of Epirus; and was constituted judge to try Michael Comnenus, suspected of engaging in a conspiracy. Theodorus Lascaris, the son of John, whom he had taught logic, appointed him governor of all the western provinces in the empire. In 1255 he was taken prisoner in a war with Michael Angelus; but gaining his liberty in 1260, by means of the emperor Palaeologus, he was sent by him ambassador to Constantine prince of Bulgaria; and was employed on several other negotiations. He wrote, *A Continuation of the Greek History*, from the Taking of Constantinople by the Latins, till it was recovered by Michael Palaeologus in 1261, which makes part of the Byzantine history; *A Treatise concerning Faith, Virtue, and the Soul*; *An Exposition upon the Sermons of St. Gregory Nazianzen*; and other pieces. Gregory Cyprian, patriarch of Acropolis's history, in his encomium upon him, prefixed to Acropolis's history, is perhaps somewhat extravagant in his praise, when he says he was equal to Aristotle in philosophy, and to Plato in the knowledge of divine things and attic eloquence.

ACROSTICUM, or **RUSTYBACK** (*Encycl.*), in botany; erroneously there spelt **ACROSTICHUM**.

Acts of the Apostles (*Encycl.*). The council of Laodicea places the Acts of the Apostles among the canonical books, and all the churches have acknowledged it as such without any controversy. There were several spurious ACTS OF THE APOSTLES; particularly, I. *Acts*, supposed to be written by Abdias, the pretended bishop of Babylon, who gave out that he was ordained bishop by the apostles themselves when they were upon their journey into Persia. II. *The Acts of St. Peter*: this book came originally from the school of the Abonites. III. *The Acts of St. Paul*, which is entirely lost. Eusebius, who had seen it, pronounces it of no authority. IV. *The Acts of St. John the Evangelist*; a book made up of by the Encratites, Manicheans, and Priscillianists. V. *The Acts of St. Andrew*; received by the Manicheans, Encratites, and Apotactics. VI. *The Acts of St. Thomas the Apostle*; received particularly by the Manicheans. VII. *The Acts of St. Philip*: this book the Gnostics made use of. VIII. *The Acts of St. Matthias*. Some have imagined, that the Jews for a long time had concealed the original acts of the life and death of St. Matthias, written in Hebrew; and that a monk of the abbey of St. Matthias at Treves, having got them out of their hands, procured them to be translated into Latin, and published them. But the critics will not allow them to be authentic. See **CANON**.

ACTS of Pilate; a relation sent by Pilate to the emperor Tiberius, concerning Jesus Christ, his death, resurrection, ascension, and the crimes of which he was convicted before him. It was a custom among the Romans, that the proconsuls and governors of provinces should draw up acts, or memoirs, of what happened in the course of their government,

and send them to the emperor and senate. The heretics corrupted these acts, at least forged others in imitation of them; and, in the reign of the Emperor Maximian, the Gentiles, to throw an odium on the Christian name, spread about spurious Acts of Pilate; which the emperor, by a solemn edict, ordered to be sent into all the provinces of the empire, and enjoined the school-masters to teach and explain them to their scholars, and make them learn them by heart. These acts, both the genuine and the spurious, are lost. There is indeed extant, in the Pseudo-Hegesippus, a letter from Pilate to the emperor Claudius, concerning Jesus Christ. But it discovers itself at first sight not to be authentic.

ACTIÆA (*Encycl.*). The first species hath a perennial root, but the stalks annually decay. It may be propagated either by seeds, or parting the roots, which should be transplanted in autumn. The seeds should be sown soon after they are ripe, or they will lie a whole year in the ground before they vegetate. They should be sown in a shady border; and as all the plants do not come up at the same time, the border should not be disturbed till the following autumn, when they should be transplanted into a shady border, where they may be allowed to remain and flower.—The second species may be propagated in the same manner; only the plants should be allowed three feet every way, on account of their wide-spreading leaves. This species delights in a light moist soil, and a shady situation.—The third is usually propagated by seeds sent annually from North America: it thrives in the same kind of soil as the former; and is very hardy, requiring no other culture than the common flowering shrubs. The plants should not be often removed, for that will prevent their flowering strong.—The fourth requires a moist loamy soil, and shady situation. It may be propagated in the same manner as the others.

ACTÆON, in fabulous history, the son of Aristeus and Autonoe; a great hunter. He was turned by Diana into a stag, for looking on her while bathing; and died by his own dogs.

ACTE, ACTÆA, or ATTIS, ancient names of Attica. Pliny extends it to the isthmus of Corinth, so as to include Megaris. Others make this last a distinct district, because Megara was always the rival and enemy of the Athenians. If so, then Attica was bounded on the west by Megara; on the north by Boeotia, separated from it by high mountains, through which there was a difficult passage; on the south by the Saronic bay, with the Egean sea on the east. It was called *Acte* from its maritime situation; hence *Actica* and *Attica*, and the epithets *Actæus* and *Atticus* (Ovid). Hence also *Attias* for *Atheniense* (Virgil).

ACTION (*Encycl.*). The abbé Girard makes a further distinction between the words *Action* and *Act*. The former, according to him, has more relation to the power that acts than the latter; whereas the latter has more relation to the effect produced than the former: and hence the one is properly the attribute of the other. Thus we may properly say, "Be sure to preserve a presence of mind in all your actions," and take care that they are all acts of equity." Dr. Reid is of opinion that no being can be an agent, or perform an action, in the proper sense of the word, which does not possess, in some degree, the powers of will and understanding. If this opinion be just, it is obvious, that what they call the powers of nature, such as *impulse, attraction, repulsion, electricity*, &c. are not, strictly speaking, powers or causes, but the effects of the agency of some active and intelligent being; and that *physical causes*, to make use of common language, are nothing more than *laws or rules*, according to which the agent produces the effect. This doctrine has been very ably controverted.

ACTIUM (anc. geog.), a town situated on the coast of Acarnania, in itself inconsiderable, but famous for a temple of Apollo, a safe harbour, and an adjoining promontory of the same name, in the mouth of the Sinus Ambracius, over against Nicopolis, on the other side of the bay: it afterwards became more famous on account of Augustus's victory over Antony and Cleopatra; and for quinquennial games instituted there, called *Adia*, or *Ludi Adriaci*. Hence the epithet *Adrius*, given to Apollo (Virgil). *Adiaca ara*, a computation of time from the battle of Actium. The promontory is now called *Capo di Pigale*.

ACTIUS, in mythology, a surname of Apollo, from Actium, where he was worshipped.

ACTUARIUS, a celebrated Greek physician, of the 13th century, and the first Greek author who has treated of mild purgatives, such as cassia, manna, senna, &c. His works were printed in one volume folio, by Henry Stephens, in 1567.

ACUNA (Christophero de), a Spanish Jesuit, born at Burgos. He was admitted into the society in 1612, being then but 15 years of age. After having devoted some years to study, he went to America, where he assisted in making converts in Chili and Peru. In 1640 he returned to Spain, and gave the king an account how far he had succeeded in the commission he had received to make discoveries on the river of the Amazons; and the year following he published a description of this river, at Madrid. Acuna was sent to Rome, as procurator of his province. He returned to Spain with the title of Qualificator of the Inquisition; but soon embarked again for the West Indies, and was at Lima in 1675, when Father Southwell published at Rome the *Bibliothèque* of the Jesuit writers. Acuna's work is entitled, *Nuevo descubrimiento del gran río de las Amazonas*; i.e. "A new discovery of the great river of the Amazons." He was ten months together upon this river, having had instructions to enquire into every thing with the greatest exactness, that his majesty might thereby be enabled to render the navigation more easy and commodious. He went on board a ship at Quito with Peter Texeira, who had already been so far up the river, and was therefore thought a proper person to accompany him in this expedition. They embarked in February 1639, but did not arrive at Para till the December following. It is thought that the revolutions in Portugal, by which the Spaniards lost all Brasil, and the colony of Para at the mouth of the river of the Amazons, were the cause that the relation of this Jesuit was suppressed; as it could not be of any advantage to the Spaniards, they were afraid it might prove of great service to the Portuguese. The copies of this work became extremely scarce, so that the publishers of the French translation at Paris asserted, that there was not one copy of the original extant, excepting one in the possession of the translator, and, perhaps, that in the Vatican library. M. de Gomberville was the author of this translation: it was published after his death, with a long dissertation. An account of the original may be seen in the Paris Journal, in that of Leipzig, and in Chevereau's History of the World.

ADAM (ROBERT), a celebrated architect, was born in 1728, at Kirkcaldy, in the county of Fife. He was the second son of W. Adam, esq. of Maryburgh, an architect of distinguished merit. He received his education at the university of Edinburgh. The friendships he formed were with men who have since eminently distinguished themselves by their literary productions; among whom were Mr. David Hume, Dr. Robertson, Dr. Adam Smith, Dr. Adam Ferguson, and Mr. John Home. At a more advanced time of life he had the good fortune to enjoy the friendship and society of Archibald Duke of Argyle, the late Mr. Charles Townsend, the Earl of

Mansfield, and several other of the most illustrious men of the age.—Mr. Adam, after his return from Italy, was appointed architect to his majesty, in the year 1762; which office, being incompatible with a seat of parliament, he resigned in 1769, on his being elected to represent the county of Kinross. It is somewhat remarkable that the arts should be deprived at the same time of two of their greatest ornaments, Sir Joshua Reynolds and Mr. Adam; and it is difficult to say which of them excelled most in his particular profession. Sir Joshua introduced a new and superior style of portrait-painting. It is equally true that Mr. Adam produced a total change in the architecture of this country; and his fertile genius in elegant ornament was not confined to the decoration of buildings, but has been diffused into almost every branch of manufacture. His talents extended beyond the line of his own profession; he displayed in his numerous drawings in landscape a luxuriance of composition, and an effect of light and shadow, which have scarcely ever been equalled. To the last period of his life, Mr. Adam displayed an increasing vigour of genius and refinement of taste; for, in a space of one year preceding his death, he designed eight great general works, beside 25 private buildings, so various in their style, and beautiful in their composition, that they have been allowed, by the best judges, sufficient of themselves to establish his fame unrivaled as an artist. His death, which happened March 2, 1792, was occasioned by the bursting of a blood-vessel in his stomach.

ADAM'S Apple. See CITRUS.

ADAM'S Needle. See YUCCA.

ADAM'S Peak, a high mountain of the East Indies, in the island of Ceylon, on the top of which they believe the first man was created.

ADAM or ADOM, a town in Persia, or on the other side the Jordan, over-against Jericho, where the Jordan began to be dried up on the passage of the Israelites; (Joshua).

ADAMA, or **ADMAH**, one of the towns that were involved in the destruction of Sodom; (Moses).

ADAMAS, in astrology, a name given to the moon.

ADAMITES (*Enech.*). Epiphanius tells us, that the Adamites were so called from their pretending to be re-established in the state of innocence, and to be such as Adam was at the moment of his creation, whence they ought to imitate him in his nakedness. They detested marriage; maintaining, that the conjugal union would never have taken place upon earth had sin been unknown; and that the privilege of enjoying women in common, was one of the rights which flowed from their establishment in original purity.

This obscure and detestable sect did not at first last long; but it was revived in the twelfth century by one Tandamus, since known by the name of *Tanchelin*, who propagated his errors at Antwerp, in the reign of the emperor Henry V. He maintained, that there ought to be no distinction between priests and laymen, and that fornication and adultery were meritorious actions. Tanchelin had a great number of followers, and was constantly attended by 3000 of these followers in arms. His sect did not however continue long after his death: but another appeared under the name of *Turlupin*, in Savoy and Dauphiny, where they committed the most brutal actions in open day.

About the beginning of the fifteenth century, one Picard, a native of Flanders, spread these errors in Germany and Bohemia, particularly in the army of the famous Zisca, notwithstanding the severe discipline he maintained. Picard pretended that he was sent into the world as a new Adam, to re-establish the law of nature; and which, according to him, consisted in exposing every part of the body, and having all the women in common. This sect found also some partizans in Poland, Holland, and England: they assembled in the night; and it

is asserted, that one of the fundamental maxims of their society was contained in the following verse: "*Jura, perura, secretum prodere noli.*"

ADDERSTONGUE. See OPHIOGLOSSUM.

ADDISON (Lancelot), son of Lancelot Addison, a clergyman, was born at Moulshelmaburne, in the parish of Crosby Ravenfworth, in Westmoreland, in the year 1632. He was educated at Queen's College, Oxford; and at the Restoration of King Charles II. accepted of the chaplainship of the garrison of Dunkirk: but that fortress being delivered up to the French in 1652, he returned to England, and was soon after made chaplain to the garrison of Tangier; where he continued seven years, and was greatly esteemed. In 1670 he returned to England, and was made chaplain in ordinary to the king; but his chaplainship of Tangier being taken from him on account of his absence, he found himself frightened in his circumstances, when he seasonably obtained the rectory of Milston in Wiltshire, worth about 120*l.* per ann. He afterwards became a prebendary of Sarum; took his degree of doctor of divinity at Oxford; and in 1683 was made dean of Lichfield, and the next year archdeacon of Coventry. His life was exemplary; his conversation pleasing, and greatly instructive; and his behaviour as a gentleman, a clergyman, and a neighbour, did honour to the place of his residence. He wrote, 1. A Short Narrative of the Revolutions of the Kingdoms of Fez and Morocco: 2. The present History of the Jews: 3. A Discourse on Catechising: 4. A modest Plea for the Clergy: 5. An Introduction to the Sacrament: 6. The First State of Mahometism: and several other pieces. This worthy divine died on the 20th of April, 1703, and left three sons: Joseph, the subject of the next article; Gullion, who died while governor of Fort St. George; Lancelot, master of arts, and fellow of Magdalen College in Oxford; and one daughter, first married to Dr. Sarte, prebendary of Westminster, and afterwards to Daniel Combes, esq.

ADDISON (Joseph), one of the brightest geniuses that this or any other country has produced; was the son of Dean Addison, the subject of the last article. He was born at Milston, near Ambresbury, in Wiltshire, on the 11th of May, 1672; and not being thought likely to live, was baptized the same day. He received the first rudiments of his education at the place of his nativity, under the reverend Mr. Nash; but was soon removed to Salisbury, under the care of Mr. Taylor; and from thence to the Charter-house, where he commenced his acquaintance with Sir Richard Steele. About fifteen, he was entered at Queen's College, Oxford, where he applied very closely to the study of classical learning, in which he made a surprising proficiency. In the year 1687, Dr. Lancaster, dean of Magdalen College, having, by chance, seen a Latin poem of Mr. Addison's, was so pleased with it, that he immediately got him elected into that house, where he took up his degrees of bachelor and master of arts. His Latin pieces, in the course of a few years, were exceedingly admired in both universities; nor were they less esteemed abroad, particularly by the celebrated Boileau, who is reported to have said, that he would not have written against Perrault, had he before seen such excellent pieces by a modern hand. He published nothing in English before the twenty-second year of his age; when there appeared a short copy of verses written by him, and addressed to Mr. Dryden, which procured him great reputation from the best judges. This was soon followed by a translation of the Fourth Georgic of Virgil (omitting the story of Aristæus), much commended by Mr. Dryden. He wrote also the Eilay on the Georgics prefixed to Mr. Dryden's translation. There are several other pieces written by him about this time; among the rest, one dated the 3d of April, 1694, addressed to H. S. that is, Dr. Sacheverel, who became

afterwards so famous, and with whom Mr. Addison lived once in the greatest friendship; but their intimacy was some time after broken off by their disagreement in political principles. In the year 1695, he wrote a poem to King William on one of his campaigns, addressed to Sir John Somers, lord-keeper of the great seal. This gentleman received it with great pleasure, took the author into the number of his friends, and bestowed on him many marks of his favour. Mr. Addison had been closely pressed, while at the university, to enter into holy orders; and had once resolved upon it: but his great modesty, his natural diffidence, and an uncommonly delicate sense of the importance of the sacred function, made him afterwards alter his resolution; and having expressed an inclination to travel, he was encouraged thereto by his patron above mentioned, who, by his interest, procured him from the crown a pension of 300*l.* per annum to support him in his travels. He accordingly made a tour to Italy in the year 1699; and, in 1701 he wrote a poetical epistle from Italy to the Earl of Halifax, which has been universally esteemed as a most excellent performance. It was translated into Italian verse by the Abbot Antonio Maria Salvini, Greek professor at Florence. In the year 1705 he published an account of his travels, dedicated to Lord Somers; which, though at first but indifferently received, yet in a little time met with its deserved applause. In the year 1702, he was about to return to England, when he received advice of his being appointed to attend Prince Eugene, who then commanded for the emperor in Italy: but the death of King William happening soon after, put an end to this affair, as well as his pension; and he remained for a considerable time unemployed. But an unexpected incident at once raised him, and gave him an opportunity of exerting his fine talents to advantage: for in the year 1704, the lord-treasurer Godolphin happened to complain to Lord Halifax, that the Duke of Marlborough's victory, at Blenheim, had not been celebrated in verse in the manner it deserved; and intimated, that he would take it kindly, if his lordship, who was the known patron of the poets, would name a gentleman capable of doing justice to so elevated a subject. Lord Halifax replied, somewhat hastily, that he did know such a person, but would not mention him; adding, that long had he seen, with indignation, men of no merit maintained in luxury at the public expence, whilst those of real worth and modesty were suffered to languish in obscurity. The treasurer answered very coolly, that he was sorry there should be occasion for such an observation, but that he would do his endeavour to wipe off such reproaches for the future; and he engaged his honour, that whoever his lordship named, as a person capable of celebrating this victory, should meet with a suitable recompence. Lord Halifax thereupon named Mr. Addison; insisting, however, that the treasurer himself should send to him; which he promised. Accordingly he prevailed on Mr. Boyle (afterwards Lord Carlton), then chancellor of the exchequer, to make the proposal to Mr. Addison; which he did in so polite a manner, that our author readily undertook the task. The lord-treasurer had a sight of the piece, when it was carried no farther than the celebrated simile of the angel; and was so pleased with it, that he immediately appointed Mr. Addison a commissioner of appeals, vacant by the promotion of Mr. Locke, chosen one of the lords commissioners for trade. The Campaign is addressed to the Duke of Marlborough; it gives a short view of the military transactions in 1704, and contains a noble description of the two great actions at Schellenberg and Blenheim. The poem will be admired as long as the victory is remembered. In 1705 he attended Lord Halifax to Hanover; and the ensuing year was appointed under-secretary to Sir Charles Hedges, secretary of state; in which office he acquitted himself so well, that the Earl of Sand-

land, who succeeded Sir Charles in December, continued Mr. Addison in his employment. A taste for operas beginning at this time to prevail in England, and many persons having solicited Mr. Addison to write one, he complied with their request, and composed his *Rosamond*. This however, whether from the defect of the music, for which our language is said by some to be very improper, or from the prejudices in favour of the Italian taste, did not succeed upon the stage: but the poetry of it has, and always will be, justly admired. About this time, Sir Richard Steele composed his comedy of the *Tender Husband*, to which Mr. Addison wrote a prologue. Sir Richard surprised him with a dedication of this play, and acquainted the public, that he was indebted to him for some of the most excellent strokes in the performance. The Marquis of Wharton, being appointed lord-lieutenant of Ireland in 1709, took Mr. Addison with him as his secretary. Her Majesty also made him keeper of the records of Ireland, and, as a farther mark of her favour, considerably augmented the salary annexed to that place. Whilst he was in this kingdom, the *Tatler* was first published; and he discovered his friend Sir Richard Steele to be the author, by an observation on *Virgil*, which he had communicated to him. He afterwards assisted considerably in carrying on this paper, which the author acknowledges. The *Tatler* being laid down, the Spectator was set on foot, and Mr. Addison furnished great part of the most admired papers; those which he wrote are distinguished by one of the letters of the muse, C, L, I, O. The Spectator made its first appearance in March 1711, and was brought to a conclusion in September 1712. He had likewise a considerable share in the *Guardian*, another paper in the same taste, which entertained the town in 1713 and 1714. His celebrated *Cato* appeared in 1713. He formed the design of a tragedy upon this subject when he was very young, and wrote it when on his travels: he retouched it in England, without any intention of bringing it on the stage; but his friends being persuaded it would serve the cause of liberty, he was prevailed on by their solicitations, and it was accordingly exhibited on the theatre with a prologue by Mr. Pope, and an epilogue by Dr. Garth. It was received with the most uncommon applause, having run thirty-five nights without interruption; and all parties, however divided, agreed in giving this play the commendation it deserved. It was no less esteemed abroad, having been translated into French, Italian, and German; and it was acted at Leghorn, and several other places, with vast applause. The Jesuits at St. Omer's made a Latin version of it, and the students acted it with great magnificence. Her Majesty Queen Anne signified an inclination of having the play dedicated to her; but the author having proposed to dedicate it elsewhere, to avoid giving offence, published it without a dedication. He had formed a design of writing another tragedy upon the death of Socrates; but this he never carried into execution. He intended also to have composed an English dictionary upon the plan of the Italian (*Della Crusca*); but, upon the death of the queen, being appointed secretary to the lords justices, he had no leisure to carry on such a work. When the Earl of Sunderland was appointed lord-lieutenant of Ireland, Mr. Addison was again made secretary for the affairs of that kingdom; and, upon the earl's being removed from the lieutenancy, he was chosen one of the lords of trade. In 1715 he began the *Freeholder*, a political paper, which was much admired, and proved of great use at that juncture. He published also, about this time, verses to Sir Godfrey Kneller upon the king's picture, and some to the Princess of Wales with the tragedy of *Cato*. In April 1717, his Majesty King George appointed our author one of his principal secretaries of state; but the fatigue of his employment having brought upon him an asthmatic disorder,

with which he had been before afflicted, he resigned his office, and retired from business. In his retirement he applied himself to a religious work, the Evidences of the Christian Religion, which he had begun long before; part of which, scarce finished, has been printed in his works. He intended also to have given an English paraphrase of some of David's psalms; but a long and painful relapse cut short all his designs, and carried off this great man on the 17th of June, 1719, in the 54th year of his age. He died at Holland-house, near Kensington, leaving behind him one daughter by the countess of Warwick, to whom he was married in 1716. After his decease, Mr. Tickell, by the author's instructions, published his works in four volumes 4to. In this edition, there are several pieces hitherto unmentioned, viz. The Dissertation on Medals; which, though not published till after his death, yet he had collected the materials, and began to put them in order, at Vienna, in 1702. A pamphlet, entitled, The Present State of the War, and the Necessity of an Augmentation, considered. The late Trial and Conviction of Count Tariff. The Whig Examiner came out on the 14th of September, 1716: there were five of these papers attributed to Mr. Addison, and they are the severest pieces he ever wrote. The *Drummer*, or the *Haunted House*, a comedy not taken notice of in this edition, was published afterwards as Mr. Addison's, by Sir Richard Steele. He is said also to have been the author of a performance, entitled *Dissertatio de insignioribus Romanorum Poetis*, and of a Discourse on Ancient and Modern Learning.

ADEL (*Encycl.*) This country produces corn, and feeds a great number of cattle. The inhabitants drive a trade in gold, silver, ivory, oil, frankincense, a sort of pepper, and other merchandizes of Arabia and the Indies. The king was formerly a vassal to the grand negus of Abyssinia: but being Mahometans, and the Abyssinians a sort of Christians, they could not agree; and in 1535 came to an open rupture, when the Adelines threw off the yoke, seeking protection from the Grand Signior. The principal places are, Adela, seated in the centre of the country, and is the town where the king resides: Zeila, near the Arabian Sea, is a rich town, and has a good trade: Barbora, near the sea-coast, is an ancient trading town. It rains very seldom in this country.

ADELME, or **ADELHELM**, son to Kenred, nephew to Ina, king of the West Saxons; after having been educated abroad, was abbot of Malmshury 30 years. He was the first Englishman who wrote in Latin, the first who brought poetry into England, and the first bishop of Sherburn. He lived in great esteem till his death, which happened in 709. He was canonized, and many miracles were told of him. He is mentioned with great honour by Camden and Bayle, and his life was written by William of Malmshury.

AFFECTED equation is that where the unknown quantity is found in two or more different degrees, or powers, E. gr. $x^3 - px^2 + qx = a^2b$; where there are three different powers of x ; viz. x^3 , x^2 , and x^1 . See **EQUATION**.

AD FINES (*Antonie*), a town of Switzerland, supposed to be the modern *Phin*, in the north of the district of Turgow, on the rivulet Thur, not far from the borders of Suabia, about half-way between Constanz and Frauenfeld. So called, because when Cecinna, general of the emperor Vitellius, with the auxiliary Rhetians, defeated the Helvetii, the former extended their borders thus far, their territory ending here; and, in time of the Romans, it was the last town in this quarter, and of some repute.

ADHA. (*Arab.*) A festival, which the Mahometans celebrate on the tenth day of the month *Dhoul-hegiat*, which is the twelfth and last of their year. This month being particularly destined for the ceremonies which the Pilgrims observe

at Mecca, it takes its name from thence, for the word signifies the *month of Pilgrimage*. On that day they sacrifice with great solemnity, at Mecca, and no-where else, a sheep, which is called by the same name as the festival itself. The Turks commonly call this festival the *Great Beiram*, to distinguish it from the lesser, which ends their fast, and which the Christians of the Levant call the *Egler of the Turks*. The Mahometans celebrate this festival, out of the city of Mecca, in a neighbouring valley; and sometimes they sacrifice there a camel. See *BAIRAM*.

ADMIRAL (*Encycl.*). Authors are divided with regard to the origin and denomination of this important officer, whom we find established in most kingdoms that border on the sea. But the most probable opinion is that of Sir Henry Spelman, who thinks, that both the name and dignity were derived from the Saracens, and, by reason of the holy wars, brought amongst us; for *admiral*, in the Arabian language, signifies a prince, or chief ruler, and was the ordinary title of the governors of cities, provinces, &c. and therefore they called the commander of the navy by that name, as a name of dignity and honour. And indeed there are no instances of admirals in this part of Europe before the year 1284, when Philip of France, who attended St. Louis in the wars against the Saracens, created an admiral. Du Cange assures us, that the Sicilians were the first, and the Genoese the next, who gave the denomination of admiral to the commanders of their naval armaments; and that they took it from the Saracen or Arabic *Emir*, a general name for every commanding officer. As for the exact time when the word was introduced among us, it is uncertain: some think it was in the reign of Edward I. Sir Henry Spelman is of opinion that it was first used in the reign of Henry III. because neither the laws of Oleron made in 1266, nor Bracton, who wrote about that time, make any mention of it; and that the term *admiral* was not used in a charter in the eighth of Henry III. wherein he granted this office to Richard de Lacey, by these words *Maritimam Angliæ*; but in the 56th year of the same reign, not only the historians, but the charters themselves, very frequently use the word *admiral*.

ADMIRATION, in general, denotes surprise, wonder, or astonishment, at any extraordinary event. Sometimes also it signifies the expression of wonder. The point of admiration, in grammar, is marked thus [!].

ADMONITION, in ecclesiastical affairs, a part of discipline much used in the ancient church. It was the first act, or step, towards the punishment or expulsion of delinquents. In case of private offences, it was performed according to the evangelical rule, privately: in case of public offence, openly, before the church. If either of those fulfilled for the recovery of the fallen person, all further proceedings in the way of censure ceased: if they did not, recourse was had to excommunication.

ADOLLAM, or **ODOLLAM** (anc. geog.), a town in the tribe of Judah, to the east of Eleutheropolis. David is said to have hid himself in a cave near this town (Bible).

ADONI, a town in the peninsula of Hindostan, on one of the branches of the river Tungabadda. It was, not many years ago, a fine city, extremely well fortified, and the capital of a small feudatory province of Golconda. It is 175 miles S. W. of Hydrabad, and 310 N. W. of Madras. E. long. 77. 0. N. Lat. 15. 37.

ADONIS, son to Cinyras, king of Cyprus, the darling of the goddess Venus: being killed by a wild boar in the Italian woods, he was turned into a flower of a blood-colour, supposed to be the Anemone. Venus was inconsolable; and no grief was ever more celebrated than this, most nations having perpetuated the memory of it by a train of anniversary ceremonies. See *ADONIA*. Among Shakspeare's poems, is a

long one on the subject of Venus's extraordinary affection for Adonis.

ADRA, a sea-port town of Granada, in Spain, 47 miles S. E. of Granada. W. Long. 2. 37. N. lat. 36. 42.

ADRAMMELECH, one of the gods of the inhabitants of Sepharvaim, who were settled in the country of Samaria, in the room of those Israelites who were carried beyond the Euphrates. The Sepharvaim made their children pass through fire, in honour of this idol, and another called Anamelech. It is supposed, that Adrammelech meant the sun, and Anamelech the moon: the first signifies the *magnificent king*; the second the *gentle king*. See *ANAMELECH*.

ADRAMYTIIUM (anc. geog.), now *Adramiti*: a town of Myfia Major, at the foot of mount Ida, an Athenian colony, with a harbour and dock near the Caicus. *Adramyttenus* the epithet; as, *Adramyttenus Sinus*, a part of the Egean Sea, on the coast of Myfia; *Adramyttenus Conventus*, sessions or assizes. The eighth in order of the nine *Conventus Juridici* of the province of Asia.

ADRANUM, or **HADRANUM** (anc. geog.), now *Aderno*, a town of Sicily, built by the elder Dionysius, at the foot of mount Ætna (Diodorus Siculus), four hundred years before Christ. So called from the temple of Aranus, or Hadranus, a god much worshipped by the Sicilians; with a river of the same name (Stephanus), now *Fiume d'Aderno*. The inhabitants, *Hadrantiani*, and *Adraniti*.

ADRASTUS, king of Argos, son of Talaua and Lyfiastis, daughter of Polybius, king of Sicyon, acquired great honour in the famous war of Thebes, in support of Polynices his son-in-law, who had been excluded the sovereignty of Thebes by Eteocles his brother, notwithstanding their reciprocal agreement. Adrastus, followed by Polynices and Tydeus, his other son-in-law, by Capaneus and Hippomedon his sister's sons, by Amphiarus his brother-in-law, and by Parthenopeus, marched against the city of Thebes; and this is the expedition of the Seven Worthies, which the poets have so often sung. They all lost their lives in this war, except Adrastus, who was saved by his horse called Arion. This war was revived ten years after by the sons of those deceased warriors, which was called the war of the Epigones, and ended with the taking of Thebes. None of them lost their lives, except Ægialeus son of Adrastus; which afflicted him so much, that he died of grief in Megara, as he was leading back his victorious army.

ADRAZZO, or **AIACCIO**. The same with *ADJAZZO*.

ADRIA, or **HADRIA** (anc. geog.), the name of two towns in Italy. One in the country of the Veneti, on the river Tartarus, between the Padus and the Athesis, called *Adria* by Pliny and Ptolemy, but *Adrius* by Strabo. Another on the river Vomanus, in the territory of the Piceni (to which Antonine's Itinerary from Rome is directed), the country of the ancestors of the emperor Adrian. From which of these the Adriatic sea is denominated, is matter of doubt. A third opinion is, that it is so called from Adrias the son of Joan, of Italian origin (Eustathius in Dionysium).

ADRIAN, or **HADRIAN** (Publius Ælius), the Roman emperor, was born at Rome Jan. 24, in the year of Christ 76. His father left him an orphan, at ten years of age, under the guardianship of Tragan, and Cælius Tatianus, a Roman knight. He began to serve very early in the armies, having been tribune of a legion before the death of Domitian. He was the person chosen by the army of Lower Æstia, to carry the news of Nerva's death to Trajan, successor to the empire. The extravagant expences which Adrian ran into in his youth, made him lose this emperor's favour; but having recovered it by a reformation in his behaviour, he was married to Sabina, a grand niece of Trajan's, and the empress Plotina became his great friend and patroness. When he was *quæstor*,

he delivered an oration in the senate; but his language was then so rough and unpolished, that he was hissed; this obliged him to apply to the study of the Latin tongue, in which he became a great proficient, and made a considerable figure for his eloquence. He accompanied Trajan in most of his expeditions, and particularly distinguished himself in the second war against the Daci; and having before been quaestor, as well as tribune of the people, he was now successively praetor, governor of Pannonia, and consul. After the siege of Atrax in Arabia was raised, Trajan, who had already given him the government of Syria, left him the command of the army; and at length, when he found death approaching, it is said he adopted him. The reality of this adoption is by some disputed, and is thought to have been a contrivance of Plotina; but however this may be, Adrian, who was then in Antiochia, as soon as he received the news thereof, and of Trajan's death, declared himself emperor, on the 11th of August, 117. No sooner had he arrived at the imperial dignity, than he made peace with the Persians, to whom he yielded up great part of the conquests of his predecessors; and from generosity, or policy, he remitted the debts of the Roman people, which according to the calculation of those who have reduced them to modern money, amounted to twenty-two millions five hundred thousand golden crowns; and he caused to be burnt all the bonds and obligations relating to those debts, that the people might be under no apprehension of being called to an account for them afterwards. He went to visit all the provinces, and did not return to Rome till the year 118, when the senate decreed him a triumph, and honoured him with the title of Father of his country; but he refused both, and desired that Trajan's image might triumph. The following year he went to Maxia, to oppose the Sarmatae. In his absence several persons of great worth were put to death; and though he protested he had given no orders for that purpose, yet the odium thereof fell chiefly upon him. No prince travelled more than Adrian; there being hardly one province in the empire which he did not visit. In 120 he went into Gaul, and from thence to Britain, where he took care to have a wall or rampart built, as a defence against those who would not submit to the Roman government. In 121 he returned into France; thence he went into Spain, to Mauritania, and at length into the East, where he quieted the commotions raised by the Parthians. After having visited all the provinces of Asia, he returned to Athens in 125, where he passed the winter, and was initiated in the mysteries of Eleusinia Ceres. He went from thence to Sicily, and saw Mount Aetna. He returned to Rome the beginning of the year 129; and, according to some, he went again, the same year, to Africa; and, after his return from thence, to the East. He was in Egypt in the year 132, revisited Syria the year following, returned to Athens in 134, and to Rome in 135. The persecution against the Christians was very violent under his reign; but it was at length suspended, in consequence of the remonstrances of Quadratus bishop of Athens, and Aritides, two Christian philosophers, who presented the emperor with some books in favour of the Christian religion. He conquered the Jews; and, by way of insult, erected a temple to Jupiter, on Mount Calvary, and placed a statue of Adonis in the manger

of Bethlehem: he caused also the images of swine to be engraved on the gates of Jerusalem.

Adrian reigned 21 years, and died at Baiae in the 63d year of his age. The Latin verses he addressed to his soul on his death-bed *, shew his uncertainty and doubts in regard to the other world. He was a prince adorned with great virtues, but they were mingled with great vices. He was generous, industrious, polite, and exact; he maintained order and discipline; he administered justice with indefatigable application, and punished rigorously all those who did not faithfully execute the offices with which they were entrusted; he had a great share of wit and a surpassing memory; he was well versed in most of the polite arts and sciences, and is said to have written several works. On the other hand, he was cruel, envious, lascivious, superstitious, and so weak as to give himself up to the study of magic: and what can be more infamous than his passion for Antinous?

Adrian, having no children by Sabina, adopted Lucius Aurelius Annus Ceionius Commodus as Verus; but Lucius dying the 1st of January, 138, he then adopted Titus Antoninus, on condition that he should adopt Marcus Annus Verus, and the son of Lucius Verus.

ADRIAN IV. (Pope), the only Englishman who ever had the honour of sitting in the papal chair. His name was Nicholas Brekepere; and he was born at Langley, near St. Alban's, in Hertfordshire. His father having left his family, and taken the habit of the monastery of St. Alban's, Nicholas was obliged to submit to the lowest offices in that house, for daily support. After some time, he desired to take the habit in that monastery, but was rejected by the abbot Richard. "He was examined," says Matthew Paris, "and being found insufficient, the abbot civilly enough said to him, Wait, my son, and go to school a little longer, till you are better qualified." But if the character given of young Brekepere, by Pitts, be a just one, the abbot was certainly to be blamed for rejecting a person who would have done great honour to his house: he was, according to that author, a handsome and comely youth, of a sharp wit, and ready utterance; circumspect in all his words and actions, polite in his behaviour, neat and elegant; full of zeal for the glory of God, and that according to some degree of knowledge; so possessed of all the most valuable endowments of mind and body, that in him the gifts of Heaven exceeded nature: his piety exceeded his education; and the ripeness of his judgment and his other qualifications exceeded his age. Having met with this repulse, he resolved to try his fortune in another country, and accordingly went to Paris; where, though in very poor circumstances, he applied himself to his studies with great assiduity, and made a wonderful proficiency. But having still a strong inclination to a religious life, he left Paris, and removed to Provence, where he became a regular clerk in the monastery of St. Rufus. He was not immediately allowed to take the habit; but passed some time, by way of trial, in recommending himself to the monks by a strict attention to all their commands. This behaviour, together with the beauty of his person, and prudent conversation, rendered him so acceptable to those religious, that after some time they treated him to take the habit of the canonical order. Here he distinguished

This translated by Pope:

Ah! fleeting spirit! wand'ring fire,
That long hast warm'd my tender breast,
Must thou no more this frame inspire?
No more a pleasing, cheerful guest,
Whither, ah whither art thou flying?
To what dark undiscover'd shore?
Thou seem'st all trembling, shivering, dying,
And wit and humour are no more!

* The verses are these:

Animula vagula, blandula,
Hesperes, comelque corporis,
Quæ nunc abibis in loca
Pallidula, rigida, nudula,
Nec, ut soles, dabis jocos!

himself so much by his learning and strict observance of the monastic discipline, that, upon the death of the abbot, he was chosen superior of that house; and we are told that he rebuilt that convent. Pope Eugenius III. being apprised of the great merit of Nicholas, and thinking he might be serviceable to the church in a higher station, created him cardinal-bishop of Alba in 1146. In the same year his Holiness sent him legate to Denmark and Norway; where, by his fervent preaching and diligent instructions, he converted those barbarous nations to the Christian faith: and erected Upsal into an archiepiscopal see. When he returned to Rome, he was received by the pope and cardinals with great marks of honour: and Pope Anastasius, who succeeded Eugenius, happening to die at this time, Nicholas was unanimously chosen to the holy see, in November 1154, and he took the name of *Adrian*. When the news of his promotion reached England, king Henry II. sent Robert abbot of St. Alban's, and three bishops, to Rome, to congratulate him on his election; upon which occasion Adrian granted very considerable privileges to the monastery of St. Alban's, particularly an exemption from all episcopal jurisdiction, excepting to the see of Rome. Adrian, in the beginning of his pontificate, boldly withstood the attempts of the Roman people to recover their ancient liberty under the consuls, and obliged those magistrates to abdicate their authority, and leave the government of the city to the pope. In 1155 he drove the heretic Arnald of Breffe, and his followers, out of Rome. The same year he excommunicated William king of Sicily, who ravaged the territories of the church, and absolved that prince's subjects from their allegiance. About the same time, Frederic king of the Romans, having entered Italy with a powerful army, Adrian met him near Sutrium, and concluded a peace with him. At this interview, Frederic consented to hold the pope's stirrup whilst he mounted on horseback. After which, his holiness conducted that prince to Rome, and in St. Peter's church placed the imperial crown on his head, to the great mortification of the Roman people, who assembled in a tumultuous manner, and killed several of the Imperialists. The next year a reconciliation was brought about between the pope and the Sicilian king, that prince taking an oath to do nothing farther to the prejudice of the church, and Adrian granting him the title of *king of the two Sicilies*. He built and fortified several castles, and left the papal dominions in a more flourishing condition than he found them. But notwithstanding all his success, he was extremely sensible of the disquietudes attending so high a station; and declaring to his countryman John of Salisbury, that all the former hardships of his life were mere amusement to the misfortunes of the popedom; that he looked upon St. Peter's chair to be the most uneasy seat in the world; and that his crown seemed to be clapped burning on his head. He died September 1, 1159, in the fourth year and tenth month of his pontificate; and was buried in St. Peter's church, near the tomb of his predecessor Eugenius.—There are extant several letters, and some homilies, written by Pope Adrian.

ADRIAN, cardinal priest, of the title of St. Chrysgonus, was a native of Cornetto in Tuscany. Innocent VIII. sent him nuncio into Scotland and into France; and after he had been clerk and treasurer of the apostolic chamber, pope Alexander VI. whose secretary he had been, honoured him with the cardinal's hat. His life was a continued scene of odd alterations. He narrowly escaped death the day Alexander VI. poisoned himself by mistake. Afterwards he drew upon himself the hatred of Julius II. so that he was obliged to go and hide himself in the mountains of Trent. Having been recalled by Leo X. he was so ungrateful, that he engaged in a conspiracy against him. The pope pardoned his fault: but the cardinal, not caring to trust to this, made his escape, and it

could never be known exactly what was become of him. He was one of the first that effectually reformed the Latin style. He studied Cicero with great success, and made many excellent observations on the propriety of the Latin tongue. The treatise he composed *De Sermone Latino*, is a proof of this. He had begun a Latin translation of the Old Testament. He wrote *De Vera Philosophia*: this treatise was printed at Cologne, 1548.

ADRIAN VI. (Pope), was born at Utrecht in 1459. His father was not able to maintain him at school, but he got a place at Louvain in a college in which a certain number of scholars were maintained *gratis*. It is reported that he used to read in the night-time by the light of the lamps in the churches or fire-places. He made a considerable progress in all the sciences; led an exemplary life; and there never was a man less intriguing and forward than he was. He took his degree of doctor of divinity at Louvain; was soon after made canon of St. Peter's, and professor of divinity at Utrecht, and then dean of St. Peter's and vice-chancellor of the university. He was obliged to leave an academical life, to be tutor to the archduke Charles. This young prince made no great progress under him: however, never was a tutor more considerably rewarded; for it was by Charles V.'s credit he was raised to the papal throne. Leo X. had given him the cardinal's hat in 1517. After this pope's death, several cabals in the conclave ended in the election of Adrian, with which the people of Rome were very much displeased. He would not change his name, and in every thing he shewed a great dislike for all ostentation and sensual pleasures, though such an aversion had been long ago out of date. He was very partial to Charles V. and did not enjoy much tranquillity under the triple crown. He lamented much the wicked morals of the clergy, and wished to establish a reformation of manners among them. He died Sept. 14, 1523.

ADRIANI (Joanni Battista), was born of a patrician family at Florence, in 1511. He wrote a History of his own times, in Italian; which is a continuation of Guicciardini, beginning at the year 1526; to which, Thuanus acknowledges himself greatly indebted: beside which, he composed six funeral orations, on the emperor Charles V. and other noble personages; and is thought to have been the author of a long letter on ancient painters and sculptors, prefixed to the third volume of Vafari. He died at Florence in 1579.

ADRIANISTS, in ecclesiastical history, a sect of heretics divided into two branches; the first were disciples of Simon Magus, and flourished about the year 34. Theodoret is the only person who has preserved their name and memory; but he gives us no account of their origin. Probably this sect, and the six others which sprung from the Simonians, took their name from the particular disciples of Simon. The second were the followers of Adrian Hamstead, the anabaptist; and held some particular errors concerning Christ.

ADRIANO A SIERRA, or mountain of Adriano, in the province of Biscay, in Spain. There is a road over it to Aalba and Old Castile, which is very difficult: at its beginning there is a dark path of 50 paces cut through a rock; after which is the mountain that must be passed over, which is one of the highest of the Pyrenées. These mountains are little frequented; and there are no inhabitants, except a few shepherds.

ADR'ANUM (or ADRIATICUM) MARE (anc. geog.), now the Gulf of Venice, a large bay in the Mediterranean, between Dalmatia, Sclavonia, Greece, and Italy. It is called by the Greeks, *Adria*; *Kadmos*; and *Adria* by the Romans, as *Arbiter Adriæ Notus* (Hor.); Cicero calls it *Hadrianum Mare*; Virgil has *Hadriaticas Undas*. It is commonly called *Mare Adriaticum*, without an aspiration; but whether it ought to have one, is a dispute; if the appellation is from *Hadria*, the town

of the Piceni, it must be written *Hadriaticum*, because the emperor's name, who thence derives his origin, is on coins and stones *Hadrarius*; but if from the town in the territory of Venice, as the more ancient, and of which that of the Piceni is a colony, this will justify the common appellation *Adriaticum*.

ADUACA (Antonic); or **ATUACA** (*Encycl.*); contracted from *Atuaca* (Cæsar); anciently a large and famous city of the Tungri; now a small and inconsiderable village, called *Tongeren*, in the bishopric of Liege, to the north-west of the city of Liège, in the territory of Haspengow, on the rivulet Jecker, that soon after falls into the Maese. E. Long. 5. 22. Lat. 50. 54.

ADVENTURE ISLAND, a small island in the South Sea, so called from the ship Adventure, in which Capt. Furneaux failed to the South Sea. Capt. Cook found the people to be mild and cheerful, with little of that wild appearance which savages in general have. They were, however, almost totally devoid of activity or genius, and were nearly on a level with the wretched natives of Tierra del Fuego. Long. 147. 29. W. Lat. 43. 21. S.

ADVENTURERS (*Encycl.*). The society of adventurers had its first establishment from John duke of Brabant in 1243. It was afterwards translated into England, and successively confirmed by Edward III. and IV. Richard III. Henry IV. V. and VII. who gave it the appellation of *Merchant Adventurers*.

ADULA, a mountain of Navarre, in Spain, lying between Pampeluna and St. Jean de Pic de Port.

ADULE, or **ADULIS** (anc. geog.), a town of Egypt built by fugitive slaves, distant from its port on the Red Sea twenty stadia. Pliny calls the inhabitants *Adulite*. The epithet is either *Adulitanus*; as, *Monumentum Adulitanum*, or the pompous inscription of the statue of Ptolemy Euergetes, published by Leo Alatus at Rome in 1631, and to be found in Spon and Thevenot: or *Adulicus*; as *Adulicus Sinus*, a part of the Red Sea.

ADULTERY (*Encycl.*). In many countries this crime has been capital; in others venial, and attended only with slight pecuniary mulcts. Some of the penalties are serious, and even cruel; others of a humorous kind. Even contrary things have been enacted as punishments for adultery. By some laws, the criminals are forbid marrying together, in case they became single; by others, they are forbid to marry any besides each other; by some, they are incapacitated from ever committing the same crime again; by others, they are glutted till it becomes nauseous to themselves, as in the reign of Theodosius already alluded to.

Among the rich Greeks, adulterers were allowed to redeem themselves by a pecuniary fine; the woman's father, in such cases, returned the dowry he had received from her husband, which some think was refunded by the adulterer. Another punishment among those people was, putting out the eyes of adulterers.

The Athenians had an extraordinary way of punishing adulterers, called *παράνομος ἀσφαλιστικός*, practised at least on the poorer sort who were not able to pay the fines. This was an awkward sort of empalement, performed by thrusting one of the largest radishes up the anus of the adulterer, or, in defect thereof, a fish with a large head, called *mugil*, mullet. Alcæus is said to have died this way, though it was doubted whether the punishment was reputed mortal. Juvenal and Catullus speak of this custom, as received also among the Romans, though not authorized by an express law, as it was among the Greeks.

Among the Romans, we are told, that the wife's father was allowed to kill both parties, committing adultery, when caught in the fact, provided he did it immediately, killing both

together, and as it were with one blow. The same power ordinarily was not indulged the husband, except the crime were committed with some mean or infamous person; though, in other cases, if his rage carried him to put them to death, he was not punished as a murderer. On many occasions, however, revenge was not carried so far; but mutilating, castrating, cutting off the ears, noses, &c. served the turn. The punishment allotted by the *lex Julia*, was not, as many have imagined, death; but rather banishment, or deportation, being interdicted fire and water: though Octavius appears, in several instances, to have gone beyond his own law, and to have put adulterers to death. Under Macrinus, many were burnt at a stake. Constantine first by law made the crime capital. Under Constantius and Constant, adulterers were burnt, or sewed in sacks and thrown into the sea. Under Leo and Marcian, the penalty was abated to perpetual banishment, or cutting off the nose. Under Justinian, a further mitigation was granted; at least in favour of the wife, who was only to be scourged, lose her dowry, and be shut up in a monastery: after two years, the husband was at liberty to take her back again; if he refused, she was shaven, and made a nun for life; but it still remained death in the husband. The reason alleged for this difference is, that the woman is the weaker vessel. Mattheus declaims against the empress Theodora, who is supposed to have been the cause of this law, as well as of others procured in favour of the sex from that emperor.

Under Theodosius, women convicted of this crime were punished after a very singular manner, *viz.* by a public conspurcation; being locked up in a narrow cell, and forced to admit to their embraces all the men that would offer themselves. To this end, the gallants were to dress themselves on purpose, having several little bells fastened to their clothes, the tinkling of which gave notice to those without of every motion. This custom was again abolished by the same prince.

To the scandal of Britain, adultery is a growing crime, notwithstanding the heavy pecuniary damages given in our courts of justice, in many cases. It is reckoned a spiritual offence, that is, cognizable by the spiritual courts. The common law takes no further notice of it, than to allow the party grieved an action and damages. This practice is often censured by foreigners, as making too light of a crime, the bad consequences of which, public as well as private, are so great. But perhaps this penalty, by civil action, is more wisely calculated to prevent the frequency of the offence, which ought to be the end of all laws, than a severer punishment. He that by a judgment of law is, according to circumstances, stripped of great part of his fortune, thrown into prison till he can pay it, or forced to fly his country, will, no doubt, in most cases, own that he pays dearly for his amusement.

ADVOW, in law, signifies the patron of a church, or he who has a right to present to a benefice.

ADZENOTA, a small town of Valencia, in Spain, seated on the mountains Pegna Golosa. Long. 2. 16. W. Lat. 39. 10. N.

ÆACUS, the son of Jupiter by Ægina. When the isle of Ægina was depopulated by a plague, his father, in compassion to his grief, changed all the ants upon it into men and women, who were called *Myrmidons*, from *μύρμηξ* an ant. The foundation of the fable is said to be, that when the country had been depopulated by pirates, who forced the few that remained to take shelter in caves, Æacus encouraged them to come out, and by commerce and industry recover what they had lost. His character for justice was such, that, in a time of universal drought, he was nominated by the Delphic oracle to intercede for Greece, and his prayer was answered. The Pagans also imagined that Æacus, on account of his impartial justice, was

chosen by Pluto one of the three judges of the dead; and that it was his province to judge the Europeans.

ÆGADES, or **ÆGATES**, three small islands, lying on the W. side of Sicily, opposite the main land, between Marsella and Trapani; their names are Levenzo, Favignana, and Maretana.

ÆGÆ, or **ÆGÆA** (anc. geog.), the name of *Ædessa*, so called from the following adventure: Caranus, the first king of Macedonia, being ordered by the oracle to seek out a settlement in Macedonia, under the conduct of a flock of goats, surprised the town of *Ædessa*, during a thick fog and rainy weather, in following the goats, that fled from the rain; which goats ever after, in all his military expeditions, he caused always to precede his standard; and in memory of this he called *Ædessa* *Ægæa*, and his people *Ægææ*. And hence probably, in the prophet Daniel, the he-goat is the symbol of the king of Macedon.

ÆGEAN SEA (anc. geog.), now the *Archipelago*, a part of the Mediterranean, separating Europe from Asia and Africa; washing, on one hand, Greece and Macedonia; on the other, Caria and Ionia. The origin of the name is greatly disputed. Festus advanced three opinions: one, that it is so called from the many islands therein, at a distance appearing like so many goats; another, because *Ægæa* queen of the Amazons perished in it: a third opinion is, because *Ægeus*, the father of Theseus, threw himself headlong into it.

ÆGELSTAWIK, a good harbour, lying about half a mile from the town of Soddertledge in Sudermania, in Sweden.

ÆGEUS, in fabulous history, was king of Athens, and the father of Theseus. The Athenians having basely killed the son of Minos king of Crete, for carrying away the prize from them, Minos made war upon the Athenians; and being victorious, imposed this severe condition on *Ægeus*, that he should annually send into Crete, seven of the noblest of the Athenian youths, chosen by lot, to be devoured by the Minotaur. On the fourth year of this tribute, the choice fell on Theseus: or, as others say, he himself intreated to be sent. The king, at his son's departure, gave orders, that as the ship sailed with black sails, it should return with the same in case he perished; but if he became victorious, he should change them into white. When Theseus returned to Crete, after killing the Minotaur, and forgot to change the sails in token of his victory, according to the agreement with his father; the latter, who watched the return of the vessel, supposing by the black sails that his son was dead, cast himself headlong into the sea, which afterwards obtained the name of the *Ægean Sea*. The Athenians decreed *Ægeus* divine honours; and sacrificed to him as a marine deity, the adopted son of Neptune.

ÆGIMURUS (anc. geog.), an island on the bay of Carthage, about 30 miles distant from that city (Livy); now the *Galleta*: this island being afterwards sunk in the sea, two of its rocks remained above water, which were called *Aræ*, and mentioned by Virgil, because the Romans and Carthaginians entered into an agreement or league to settle their mutual boundaries on these rocks.

ÆGINA, in fabulous history, the daughter of *Æolus*, king of Beotia, was beloved by Jupiter, who debauched her in the similitude of a lambent flame, and then carried her from Epidaurus to a desert island called *Oenope*, which afterwards obtained her own name.

ÆGINA (anc. geog.), now *Engia*, an island on the Saronic Bay, or Bay of Engia, twenty miles distant from the Piræus, formerly vying with Athens for naval power, and at the sea-fight of Salamin disputing the palm of victory with the Athenians. It was the country and kingdom of *Æacus*, who called it *Ægina* from his mother's name, it being before called *Oenopia* (Ovid). The inhabitants were called *Æginetæ* and

Æginetis. The Greeks had a common temple in *Ægina*. The soil was gleby underneath, but rocky on the surface: yet yielding plenty of barley. The *Æginetæ* applied to commerce; and were the first who coined money, called *Νεμισμα Ἀγιναιον*: hence *Ægineticum æi*, formerly in great repute. The inhabitants were called *Myrmydoni*, or a nation of ants, from their great application to agriculture. See *Æacus*, (Suppl.).

ÆGINETA (Paulus), a celebrated surgeon of the island of *Ægina*, from whence he derived his name. According to Mr. Le Clerc's calculation, he lived in the fourth century; but Abulpharagus the Arabian, who is allowed to give the best account of those times, places him with more probability in the seventh. His knowledge in surgery was very great, and his works are deservedly famous. Fabricius ab Aquapendente has thought fit to transcribe him in a great variety of places. Indeed the doctrine of Paulus *Ægineta*, together with that of Celsus, and Albucasis, make up the whole text of this author. He is the first writer who takes notice of the cathartic quality of rhubarb; and according to Dr. Milward, is the first in all antiquity who deserves the title of man-midwife.

ÆGINHARD, the celebrated secretary and supposed son-in-law of Charlemagne. He is said to have been carried through the snow on the shoulders of the affectionate and ingenious Imma, to prevent his being tracked from her apartments by the emperor her father: a story which the elegant pen of Addison has copied and embellished from an old German chronicle, and inserted in the third volume of the Spectator. He was a native of Germany, and educated by the munificence of his imperial master, of which he has left the most grateful testimony in his preface to the life of that monarch. *Æginhard*, after the loss of his lamented wife, is supposed to have passed the remainder of his days in religious retirement, and to have died soon after the year 840. He wrote the life of Charlemagne, and Annals from 741 to 889.

ÆGIPAN, in heathen mythology, a denomination given to the god Pan, because he was represented with the horns, legs, feet, &c. of a goat.

ÆGISTHUS, son of Thyestes by his own daughter Philœpeia, who, to conceal her shame, exposed him in the woods: some say he was taken up by a shepherd, and suckled by a goat, whence he was called *Ægisthus*. He corrupted Clytemnestra the wife of Agamemnon; and with her assistance slew her husband, and reigned seven years in Mycenæ. He was, together with Clytemnestra, slain by Orestes. Pompey used to call Julius Cæsar *Ægisthus*, on account of his having corrupted his wife Mutia, whom he afterward put away, though he had three children by her.

ÆGIUM (anc. geog.), a town of Achaia Propria, five miles from the place where Helice stood, and famous for the council of the Achæans, which usually met there, on account either of the dignity, or commodious situation of the place. It was also famous for the worship of *Οὐρανὸς Ζεὺς*, *Conventional Jupiter*, and of *Παναχæαν Ceres*. The territory of *Ægium* was watered by two rivers, viz. the Phœnix and Meganitis. The epithet is *Ægienis*. There is a coin in the cabinet of the king of Prussia, with the inscription of AIT, and the figure of a tortoise, which is the symbol of Peloponnetus, and leaves no doubt as to the place where it was struck.

ÆGLEFINUS, or *Haddock*, in ichthyology, a species of the gadus. See *GADUS*.

ÆGOS POTAMOS (anc. geog.), a river in the Thracian Chersonesus, falling with a south-east course into the Hellespont, to the north of Sestos; also a town, station, or road for ships, at its mouth. Here the Athenians, under Conon, through the fault of his colleague Ilocrates, received so fatal a blow from the Lacedæmonians under Lyfander, in a sea-engagement, as to cost them their liberty and their all.

ÆGYPTILLA (*Æncycl.*), in natural history, the name of a fene described by the ancients. The descriptions left us of this remarkable fossil tell us, that it was variegated with, or composed of, veins of black and white, or black and blueish, with sometimes a plate or vein of whitish red. The authors of these accounts seem to have understood by this name the feral fones of the onyx, fardonyx, and camea kind, all which we have at present common among us, but none of which possess any of the strange properties attributed to this.

ÆGYPTUS (fab. hist.) was the son of Beicus, and brother of Danaus.

ÆINATEÆ, in antiquity (*Æncycl.*), erroneously there spelt **ÆINAUTEÆ**.

ÆILIAN (Claudius), born at Præneste in Italy. He taught rhetoric at Rome, according to Perizonius, under the empéror Alexander Severus. He was furnished *Μετὰ λόγον*, Honey-mouth, on account of the sweetness of his style. He was likewise honoured with the title of Sophist, an appellation in his days given only to men of learning and wisdom. He loved retirement, and devoted himself to study. He greatly admired and studied Plato, Aristotle, Ilocrates, Plutarch, Homer, Anacreon, Archilochus, &c. and, though a Roman, gives the preference to the writers of the Greek nation. His two most celebrated works are, his Various History, and History of Animals. He composed likewise a book on Providence, mentioned by Eustathius; and another on Divine Appearances, or The Declarations of Providence. There have been several editions of his Various History.

ÆLII PONS (anc. geog.), one of the fortresses near the wall or rampart, or, in the words of the Notitia, through the line of the higher wall; built, as is thought, by Adrian. Now Portland (Camden), in Northumberland, between Newcastle and Morpeth.

ÆMILIUS (Paulus), the son of Lucius Paulus, who was killed at the battle of Cannæ, was twice consul. In his first consulate he triumphed over the Ligurians; and in the second subdued Perseus king of Macedonia, and reduced that country to a Roman province, on which he obtained the surname of Macedonicus. He returned to Rome loaded with glory, and triumphed for three days. He died 168 years before Christ.

ÆMILIUS (Paulus), a celebrated historian, born at Verona, who obtained such reputation in Italy, that he was invited into France by the Cardinal of Bourbon, in the reign of Lewis XII. in order to write the history of the kings of France in Latin, and was given a canonry in the cathedral of Paris. He was near thirty years in writing that history, which has been greatly admired; and died at Paris on the 5th of May, 1529.

ÆNARIA (anc. geog.), an island on the bay of Cumæ, or over-against Cumæ in Italy (Pliny). It is also called *Inarime* (Virgil); and now *Ischia*: scarce three miles distant from the coast, and the promontory Misenus to the west; twenty miles in compass; called *Pithecusæ* by the Greeks. It is one of the Oenotrides, and fenced round by very high rocks, so as to be inaccessible but on one side: it was formerly famous for its earthen ware. See *ISCHIA*.

ÆNEAS (fab. hist.), a famous Trojan prince, the son of Anchises and Venus. At the destruction of Troy, he bore his aged father on his back, and saved him from the Greeks; but being too solicitous about his son and household gods, lost his wife Creusa in the escape. Landing in Africa, he was kindly received by Queen Dido: but quitting her coast, he arrived in Italy, where he married Lavinia the daughter of King Latinus, and defeated Turnus, to whom the had been contracted. After the death of his father-in-law, he was made king of the Latins, over whom he reigned three years: but joining

with the Aborigines, he was slain in a battle against the Tuscans. Virgil has rendered the name of this prince immortal, by making him the hero of his poem.

ÆNEAS (Gazeus), or **ÆNEAS** of Gaza, by profession a sophist, was originally a Platonic philosopher, but afterwards became a Christian, and flourished about the year 487. His age is ascertained from his assuring us, that he saw the African confessors, whose tongues were cut out by Hunneric, king of the Vandals, in 484, under the reign of the emperor Zeno; and in this we may believe him. But can we so safely believe him, when he affirms, that he heard these confessors speak very plainly and distinctly, after their tongues were indeed cut out? He wrote a dialogue, entitled, Theophrastus, concerning the immortality of the soul, and the resurrection of the body; and which he has enlivened with many curious enquiries into the sentiments of the philosophers, and with many agreeable stories. This dialogue was first translated into Latin, and published at Basil, in 1516: afterwards in Greek and Latin at Basil, in 1560, with other pieces: afterwards at Leipzig, 1658, with a translation and notes, by Barthius, in quarto.

ÆNCINA (*Æncycl.*). This island lies in the bay of Engia, and the town of that name contains about 800 houses and a castle; and near it are the ruins of a magnificent structure, which was probably a temple.

ÆNIGMA (*Æncycl.*). In Greek, *Ανigma*, is formed of *ανιστομαι*, *obscure* *invenire*, to hint a thing darkly, and of *ανος*, an obscure speech or discourse. The popular name is *riddle*; from the Belgic *raeden*, or the Saxon *araethan*, to interpret. Fa. Bouhours, in the Memoirs of Trevoux, defines an *ænigma*, A discourse, or painting, including some hidden meaning, which is proposed to be guessed.

The alchemists are great dealers in the *ænigmatic* language, their processes for the philosophers stone being generally wrapped up in riddles: e. g. *Fac ex mare et femina circum, inde quadrangulum, hinc triangulum, fac circum, et habebis lapidem philosophorum*.—F. Menestrier has attempted to reduce the composition and resolution of *ænigmas* to a kind of art, with fixed rules and principles, which he calls the philosophy of *ænigmatic* images.

There are some *ænigmas* in history, complicated to a degree which much transcends all rules, and has given great perplexity to the interpreters of them. Such is that celebrated ancient one, *Ælia Lælia Crispis*, about which many of the learned have puzzled their heads. There are two exemplars of it: one found 140 years ago, on a marble near Bologna; the other in an ancient MS. written in Gothic letters, at Milan. It is controverted between the two cities, which is to be reputed the more authentic.

The Bononian *Ænigma*.

D. M.

Ælia Lælia Crispis,

Nec vir, nec mulier,

Nec androgyna;

Nec puella, nec juvenis,

Nec anus;

Nec casta, nec meretrix,

Nec pudica;

Sed omnia;

Sublata

Neque fame, neque ferro,

Neque veneno;

Sed omnibus:

Nec celo, nec terris,

Nec aquis,

Sed ubique jacet.

Lucius Agatho Prifcius,

Nec muritus, nec amator,

Nec necerarius;

Neque morrens, neque gaudens,

Neque flens;

Hanc,

Nec molem, nec pyramidem,

Nec sepulchrum,

Sed omnia,

Scit et nescit, cui posuerit.

That is to say, To the gods manes, *Ælia Lælia Crispis*, neither man, nor woman, nor hermaphrodite; neither girl, nor young woman, nor old; neither chaste, nor a whore; but all these: killed neither by hunger, nor steel, nor poison; but by all these: rests neither in heaven, nor on earth, nor in the waters; but every-where. *Lucius Agatho Prifcius*, neither her husband, nor lover, nor friend; neither sorrowful, nor joyful, nor weeping, certain, or uncertain, to whom he rears this monument, neither erects her a temple, nor a pyramid, nor a tomb, but all these. In the MS. at Milan, instead of D.M. we find A.M. P.P.D. and at the end the following addition:

Hoc est sepulchrum intus cadaver non habens.

Hoc est cadaver sepulchrum extra non habens,

Sed cadaver idem est & sepulchrum.

We find near 50 several solutions of this ænigma advanced by learned men. Marius Michael Angelus maintains *Ælius Lælia Crispis* to signify rain-water falling into the sea. Ri. Vitus first explained it of Niobe turned to a stone, afterwards of the rational soul, and afterwards of the Platonic idea; Jo. Torrius, of the *materia prima*; Fr. Schottus, of an eunuch; Nic. Bernardus, of the philosophers-stone, in which he is followed by Borrichius; Zach. Pontinus, of three human bodies in the same situation, and buried by three different men at the same time; Nesmondus, of a law-suit; Jo. Gal. Gerardus, of love; Zu. Boxhornius, of a shadow; P. Taronus, of music; Fort Licetus, of generation, friendship, and privation; M. Ov. Montalbani, of hemp; Car. Cæf. Malvasia, of an abortive girl promised in marriage; Pet. Mengulus, of the rule of chastity, prescribed by the founder of the military religion of St. Mary; M. de Ciconia, of pope Joan; Heumannus, of Lot's wife; and lastly, J.C.S. an anonymous writer in the Leipzig Acts, of the Christian church.

ÆOLIE INSULÆ, now *Isole di Lipari* (anc. geog.), seven islands, situated between Sicily and Italy (Strabo, Diodorus Siculus, Mela); so called from *Æolus*, who reigned there about the time of the Trojan war. The Greeks called them *Hephæstides*; and the Romans, *Vulcania*, from their fiery eruptions. They are also called *Liparorum Insulæ*, from the principal island Lipara. Dionysius Periegetes calls them *Insulæ*, because circumnavigable.

ÆOLUS, in mechanics, a small machine, the invention of Mr. Tidd, calculated for changing the air in rooms when too hot or unfit for respiration. It supplies the place of a square in the window, and works with very little noise, like the sails of a common window ventilator.

Æon (*Æon*). The Valentinians, who, in the first ages of the church, blended the conceits of the Jewish cabalists, the Platonists, and the Chaldean philosophers, with the simplicity of the Christian doctrine, invented a kind of Theogony, or Genealogy of Gods (not unlike that of Hesiod), whom they called by several glorious names, and all by the general appellation of *Æons*: among which they reckoned *Zon, Life, Aëon, Word, Monens, Only-begotten; Παρρησια, Fulness*; and

Vol. X.

many other divine powers and emanations, amounting in number to thirty: which they fancied to be successively derived from one another; and all from one self-originated deity, named *Bythus*, i. e. profound or unfathomable; whom they called likewise, *The most high and ineffable Father*. See VALENTINIANS.

ÆQUIMELIUM, in antiquity, a place in Rome, where stood the house of Spurius Melius, who, by largesses corrupting the people, affected the supreme power: refusing to appear before the dictator Cincinnatus, he was slain by Servilius Ahala, master of the horse; his house was razed to the ground; and the spot on which it stood was called *Area Æquimeli*. (Livy.)

FLOS ÆRIS, among alchemists, small scales procured from copper melted by a strong heat; it is sometimes used for arguro or verdigrise.

AEROGRAPHY (*Ænecy.*), a description of the air. In the last line but two of that article for "rational" read "rationale."

ÆSCHINES, a Socratic philosopher, the son of Charinus a sausage-maker. He was continually with Socrates; which occasioned this philosopher to say, that the sausage-maker's son was the only person who knew how to pay a due regard to him. It is said that poverty obliged him to go Sicily, to Dionysius the Tyrant; and that he met with great contempt from Plato, but was extremely well received by Aristippus, to whom he shewed some of his dialogues, and received from him a handsome reward. He would not venture to profess philosophy at Athens, Plato and Aristippus being in such high esteem; but he set up a school to maintain himself. He afterwards wrote orations for the Forum. Phrynus, in Photius, ranks him amongst the best orators, and mentions his orations as the standard of the pure Attic style. Hermogenes has also spoken very highly of him.—He also wrote several dialogues, of which there are only three extant: 1. Concerning Virtue, whether it can be taught. 2. Eryxias, or Erastriatus; concerning riches, whether they are good. 3. Axiochus; concerning death, whether it is to be feared. Mr. Le Clerc has given a Latin translation of them, with notes, and several dissertations, entitled *Sylve Philologicæ*.

ÆSCHINES, a celebrated orator, contemporary with Demosthenes, and but just his inferior. Some say that Isocrates, some say that Socrates, some that Gorgias, was his master. Being overcome by Demosthenes, he went to Rhodes, and opened a school there; and afterwards removed to Samos, where he died at the age of seventy-five. There are only three of his orations extant, which however are so very beautiful, that Fabricius compares them to the three graces. One is against Timarchus, his accuser, whom he treated so severely, as to make him weary of life; and some have said, that he did actually lay violent hands upon himself. Another is an Apology for himself against Demosthenes, who had accused him of perjury in an embassy to Philip. The third, against Ctesiphon, who had decreed the golden crown to Demosthenes. This excellent oration, together with that of Demosthenes against it, was translated by Cicero into Latin, as St. Jerome and Sdonius informs us.—The three orations were published by Aldus, 1515, and by Henry Stephens among other orators 1575, in Greek.

ÆSCHYLUS, the tragic poet, was born at Athens. Authors differ in regard to the time of his birth, some placing it in the 65th, others in the 70th Olympiad; but according to Stanley, who relies on the Arundelian marbles, he was born in the 63d Olympiad. He was the son of Euphorion, and brother to Cynegirus and Aminias, who distinguished themselves in the battle of Marathon, and the sea-fight of Salamis, at which engagements Æschylus was likewise present. In this

last action, according to Diodorus Siculus, Aminias, the younger of the three brothers, commanded a squadron of ships, and behaved with so much conduct and bravery, that he sunk the admiral of the Persian fleet, and signalized himself above all the Athenians. To this brother our poet was, upon a particular occasion, obliged for saving his life: Ælian relates, that Æschylus being charged by the Athenians with certain blasphemous expressions in some of his pieces, was accused of impiety, and condemned to be stoned to death: they were just going to put the sentence in execution, when Aminias, with a happy presence of mind, throwing aside his cloak, shewed his arm without a hand, which he had lost at the battle of Salamis, in defence of his country. This sight made such an impression on the judges, that, touched with the remembrance of his valour, and with the friendship he shewed for his brother, they pardoned Æschylus. Our poet, however, resented the indignity of this prosecution, and resolved to leave a place where his life had been in danger. He became more determined in this resolution when he found his pieces less pleasing to the Athenians than those of Sophocles, though a much younger writer. Some affirm, that Æschylus never sat down to compose but when he had drank liberally. He wrote a great number of tragedies, of which there are but seven remaining: and notwithstanding the sharp censures of some critics, he must be allowed to have been the father of the tragic art. In the time of Theſpis, there was no public theatre to act upon; the strollers driving about from place to place in a cart. Æschylus furnished his actors with masks, and dressed them suitably to their characters. He likewise introduced the buskin, to make them appear more like heroes.—The ancients give Æschylus also the praise of having been the first who removed murders and shocking sights from the eyes of the spectators. He is said likewise to have lessened the number of the chorus. M. Le Fevre has observed, that Æschylus never represented women in love, in his tragedies; which, he says, was not suited to his genius: but, in representing a woman transported with fury, he was incomparable. Longinus says, that Æschylus has a noble boldness of expression; and that his imagination is lofty and heroic. It must be owned, however, that he affected pompous words, and that his sense is too often obscured by figures: this gave Salmastius occasion to say, that he was more difficult to be understood than the scripture itself. But notwithstanding these imperfections, this poet was held in great veneration by the Athenians, who made a public decree that his tragedies should be played after his death. He was killed in the 69th year of his age, by an eagle letting fall a tortoise upon his head as he was walking in the fields. He had the honour of a pompous funeral from the Sicilians, who buried him near the river Gela; and the tragedians of the country performed plays and theatrical exercises at his tomb.—The best edition of his plays is that of London, 1663, fol. with a Latin translation and a learned commentary by Tho. Stanley.

ÆSCULANUS, or **ÆRES**, in mythology, a deity who presided over the coinage of copper-money.

ÆSCULAPIUS, in the heathen mythology, the god of physic, was the son of Apollo and the nymph Coronis. He was educated by the centaur Chiron, who taught him physic; by which means Æsculapius cured the most desperate diseases. But Jupiter, enraged at his restoring to life Hippolitus who had been torn in pieces by his own horses, killed him with a thunderbolt. According to Cicero, there were three deities of this name: the first, the son of Apollo, worshipped in Arcadia, who invented the probe, and bandages for wounds; the second, the brother of Mercury, killed by lightning; and the third, the son of Arisippus and Arisnoe, who first taught the

art of tooth-drawing and purging. At Epidaurus, Æsculapius's statue was of gold and ivory, with a long beard, his head surrounded with rays, holding in one hand a knotty stick, and the other entwined with a serpent; he was seated on a throne of the same materials as his statue, and had a dog lying at his feet. The Romans crowned him with laurel, to represent his descent from Apollo; and the Phalasiæni represented him as beardless. The cock, the raven, and the goat, were sacred to this deity. His chief temples were at Pergamus, Smyrna, Tricca a city in Ionia, and the Isle of Cos; in all which, votive tablets were hung up, shewing the diseases cured by his assistance. But his most famous shrine was at Epidaurus; where, every five years, games were instituted to him, nine days after the Isthmian games at Corinth.

ÆSOP, the Phrygian, lived in the time of Solon, about the 50th Olympiad, under the reign of Croesus the last king of Lydia. As to genius and abilities, he was greatly indebted to nature; but in other respects not so fortunate, being born a slave and extremely deformed. St. Jerom, speaking of him, says he was unfortunate in his birth, condition in life, and death; hinting thereby at his deformity, servile state, and tragical end. His great genius however enabled him to support his misfortunes; and in order to alleviate the hardships of servitude, he composed those entertaining and instructive fables which have acquired him so much reputation. He is generally supposed to have been the inventor of that kind of writing; but this is contested by several; particularly Quintilian, who seems to think that Hesiod was the first author of fables. Æsop, however, certainly improved this art to a very great degree; and hence it is that he has been accounted the author of this sort of productions.

The first master whom Æsop served, was one Caranus Demarchus, an inhabitant of Athens; and there in all probability he acquired his purity in the Greek tongue. After him he had several masters; and at length came under a philosopher named Idmon or Iadmon, who enfranchised him. After he had recovered his liberty, he soon acquired a great reputation amongst the Greeks; so that, according to Meziriac, the report of his wisdom having reached Croesus, he sent to enquire after him, and engaged him in his service. He travelled through Greece, according to the same author; whether for his own pleasure, or upon the affairs of Croesus, is uncertain; and passing Athens soon after Pisistratus had usurped the sovereign power, and finding that the Athenians bore the yoke very impatiently, he told them the fable of the frogs who petitioned Jupiter for a king. The images made use of by Æsop are certainly very happy inventions to instruct mankind; they possess all that is necessary to perfect a precept, having a mixture of the useful with the agreeable. "Æsop the fabulist (says Aulus Gellius) was deservedly esteemed wise, since he did not, after the manner of the philosophers, rigidly and imperiously dictate such things, as were proper to be advised and persuaded; but, framing entertaining and agreeable apologies, he thereby charms and captivates the human mind."—Æsop was put to death at Delphi. Plutarch tells us, that he came there with a great quantity of gold and silver, being ordered by Croesus to offer a sacrifice to Apollo, and to give a considerable sum to each inhabitant: but a quarrel arising betwixt him and the Delphians, he sent back the money to Croesus; for he thought those for whom the prince designed it, had rendered themselves unworthy of it. The inhabitants of Delphi contrived an accusation of sacrilege against him; and pretending they had convicted him, threw him headlong from a rock. For this cruelty and injustice, we are told, they were visited with famine and pestilence; and consulting the oracle, they received for answer, that the god de-

signed this as a punishment for their treatment of Æsop: they endeavoured to make an atonement, by raising a pyramid to his honour.

Æsop, a Greek historian, who wrote a romantic history of Alexander the Great: it is not known at what time he lived. His work was translated into Latin by one Julius Valerius, who is not better known than Æsop. Freinhemius has the following passage concerning this work: "Julius Valerius wrote a fabulous Latin history of Alexander, which by some is ascribed to Æsop, by others to Calisthenes. Hence Antoninus, Vincentius, Uspargensis, and others, have greedily taken their romantic tales. It may not be amiss to quote here the opinion of Barthius, in his *Adversaria*: "There are many things (says this author) in the learned monk, who some years ago published a life of Alexander the Great, full of the most extravagant fictions; yet this romance had formerly so much credit, that it is quoted as an authority even by the best writers. It is the same author that Franciscus Juretus mentions under the name of Æsop." This work was published in German at Straßburg, in 1486.

Æsop (Clodius), a celebrated actor, who flourished about the 670th year of Rome. He and Roscius were contemporaries, and the best performers who ever appeared upon the Roman stage, the former excelling in tragedy, the latter in comedy. Cicero put himself under their direction to perfect his action. Æsop lived in a most expensive manner, and at one entertainment is said to have had a dish which cost above eight hundred pounds; this dish, we are told, was filled with singing and speaking birds, some of which cost near 50*l*. The delight which Æsop took in this sort of birds proceeded, as Mr. Boyle observes, from the expence. He did not make a dish of them because they could speak, this motive being only by accident, but because of their extraordinary price. If there had been any birds that could not speak, and yet more scarce and dear than these, he would have procured such for his table. Æsop's son was no less luxurious than his father, for he dissipated pearls for his guests to swallow. Some speak of this as a common practice of his; but others mention his falling into this excess only on a particular day, when he was treating his friends. Horace speaks only of one pearl of great value, which he dissipated in vinegar, and drank. Æsop, notwithstanding his expences, is said to have died worth above 160,000*l*. When he was upon the stage, he entered into his part to such a degree, as sometimes to be seized with a perfect ecstacy: Plutarch mentions it as reported of him, that whilst he was representing Atreus deliberating how he should revenge himself on Thyestes, he was so transported beyond himself in the heat of action, that with his truncheon he smote one of the servants crossing the stage, and laid him dead on the spot.

ÆSYMNIUM (*Encycl.*). Æsymnus the Megarean, consulting the oracle in what manner the Megareans might be most happily governed, was answered, *If they held consultation with the more numerous*: whom he taking for the dead, built the *Æsymnium*, and a senate-house that took within its compass the monument; imagining, that thus the dead would assist at their consultations. (Pausanias.)

ÆTHIOPS Mineral (*Encycl.*). For the reference to "PHARMACY," read CHEMISTRY, p. 445.

ÆTION, a celebrated painter, who has left us an excellent picture of Roxana and Alexander, which he exhibited at the Olympic games: it represents a magnificent chamber, where Roxana is sitting on a bed of a most splendid appearance, which is rendered still more brilliant by her beauty. She looks downwards, in a kind of confusion, being struck with the presence of Alexander standing before her. A number of

little Cupids flutter about, some holding up the curtain, as if to shew Roxana to the prince, whilst others are busied in undressing the lady; some pull Alexander by the cloak, who appears like a young bathful bridegroom, and present him to his mistress: he lays his crown at her feet, being accompanied by Ephection, who holds a torch in his hand, and leans upon a youth, who represents Hymen. Several other little Cupids are represented playing with his arms; some carry his lance, stooping under its heavy weight, others bearing along his buckler, upon which one of them is seated, whom the rest carry in triumph; another lies in ambush in his armour, waiting to frighten the rest as they pass by. This picture gained Ætion so much reputation, that the president of the games gave him his daughter in marriage.

ÆTIUS, one of the most zealous defenders of Arianism, was born in Syria, and flourished about the year 336. After being servant to a grammarian, of whom he learned grammar and logic, he was ordained deacon, and at length bishop, by Eudoxus patriarch of Constantinople. St. Epiphanius has preserved 47 of his propositions against the Trinity. His followers were called ÆTIANIS.

ÆTIUS, a famous physician, born at Amida in Mesopotamia, and the author of a work entitled *Tetrabiblos*, which is a collection from the writings of those physicians who went before him. He lived, according to Dr. Freind, at the end of the 5th or the beginning of the 6th century.

ÆTIUS, governor of Gallia Narbonensis in the reign of Valentinian III. forced the Franks who were passing into Gaul to repass the Rhine. He defeated the Goths; and routed Attila king of the Huns, who invaded Gaul with an army of 700,000 men. But the emperor, jealous of the merit of this great man, killed him in 454 with his own hand, under the pretence that he had permitted the invasion of the Huns, after Attila's defeat.

ÆTNA (*Encycl.*). Concerning the dimensions of mount Ætna, we can scarce extract any thing consistent, even from the accounts of the latest and most ingenious travellers. Pindar, who lived about 435 years before Christ, calls it the *Pillar of Heaven*, on account of its great height. All modern writers likewise agree, that this mountain is very high, and very large; but differ excessively as to its height and magnitude: some making it no less than twelve miles high, others eight, others six, some four, while Mr. Brydone, and Sir William Hamilton, who lately ascended to its highest summit, reduce its height to little more than two miles; nay, by some, it is reduced to 10,036 feet, somewhat less than two miles. No less remarkable are the differences concerning its circumference: some making it only sixty miles round, others 100; and Signior Recupero, from whom Mr. Brydone had his information in this respect, affirms it to be no less than 183 miles in circuit.

But if we are embarrassed with the circumference of Ætna, we are much more so with the accounts relating to its height; and one circumstance, particularly, creates almost insurmountable difficulties. It is agreed upon by all travellers, and among the rest by Sir William Hamilton, that from Catania, where the ascent first begins, to the summit, is not less than thirty miles. The descent on the other side we have no account of; but, whatever supposition we make, the height of the mountain must be prodigious. If we suppose it likewise to be thirty miles, and that mount Ætna can be represented by an equilateral triangle, each of whose sides is thirty miles, we will have an amazing elevation indeed, no less than twenty-six miles perpendicular!—Such a height being beyond all credibility, we must contract the sides of our triangle, in proportion to its basis. We shall begin with allowing ten miles for the

difference between a straight line from Catania to the summit, and the length of the road, occasioned by the inequalities of the mountain; and supposing the descent on the other side to be somewhat shorter, we may call it fifteen miles. Mount Ætna will now be represented by a scalene triangle, whose base is thirty miles, its longest side twenty, and its shortest fifteen; from which proportions we will find its height to be betwixt eight and nine miles.—This is still incredible; and when all the various relations concerning the height of Ætna are compared, we hope it will not be thought presumptuous in us to give it as our opinion, that the true dimensions of this mountain are as yet unknown.

Concerning the products and general appearance of this volcano, authors are much better agreed.—The journey from Catania to its summit has been lately described by three travellers, M. D'Orville, Mr. Brydone, and Sir William Hamilton. All these agree, that this single mountain affords an epitome of the different climates throughout the whole world: towards the foot, it is very hot; farther up, more temperate; and grows gradually more and more cold the higher we ascend. At the top, it is perpetually covered with snow: from thence the whole island is supplied with that article, so necessary in a hot climate, and without which the natives say Sicily could not be inhabited. So great is the demand for this commodity, that the bishop's revenues, which are considerable, arise from the sale of mount Ætna's snow; and he is said to draw 1000*l.* a-year from one small portion lying on the north side of the mountain. Great quantities of snow and ice are likewise exported to Malta and Italy, making a considerable branch of commerce. On the north side of this snowy region, Mr. Brydone was assured, that there are several small lakes which never thaw; and that the snow mixed with the ashes and salts of the mountain are accumulated to a vast depth. The quantity of salts contained in this mountain, he, with great probability, conjectures to be one reason of the preservation of its snows; for salt increases the coldness of snow to a surprising degree.

In the middle of the snowy region stands the great crater, or mouth of Ætna; from which, though contrary to the usual method of travellers, we shall begin our particular account of this mountain. Sir William Hamilton describes the crater as a little mountain, about a quarter of a mile perpendicular, and very steep, situated in the middle of a gently inclining plain, of about nine miles in circumference. It is entirely formed of stones and ashes; and, as that gentleman (then Mr. Hamilton) was told by several people of Catania, had been thrown up about twenty-five or thirty years before that time (1762). Before this mountain was thrown up, there was only a prodigious large chasm, or gulph, in the middle of the above-mentioned plain; and it has been remarked, that about once in 100 years the top of Ætna falls in; which undoubtedly must be the case at certain periods, or the mountain behaved continually to increase in height. As this little mountain, though emitting smoke from every pore, appeared solid and firm, Mr. Hamilton and his companions went up to the very top. In the middle is a hollow, about two miles and a half in circumference, according to Mr. Hamilton; three miles and a half, according to Mr. Brydone; and three or four according to Mr. D'Orville. The inside is cruised over with salts and sulphur of different colours. It goes shelving down, from the top, like an inverted cone; the depth, in Mr. Hamilton's opinion, nearly corresponding to the height of the little mountain. From many places of this space issue volumes of sulphureous smoke, which being much heavier than the circumambient air, instead of ascending in it, roll down the side of the mountain, till, coming to a more dense atmosphere, it shoots off horizon-

tally, and forms a large tract in the air, according to the direction of the wind; which, happily for our travellers, carried it exactly to the side opposite to which they were placed. In the middle of this funnel is the tremendous and unfathomable gulph, so much celebrated in all ages, both as the terror of this life, and the place of punishment in the next. From this gulph continually issue terrible and confused noises, which in eruptions are increased to such a degree as to be heard at a prodigious distance. Its diameter is probably very different at different times: for Mr. Hamilton observed, by the wind clearing away the smoke from time to time, that the inverted hollow cone was contracted almost to a point; while Mr. D'Orville and Mr. Brydone found the opening very large. Both Mr. Brydone and Mr. Hamilton found the crater too hot to descend into it: but Mr. D'Orville was bolder; and accordingly he and his fellow-traveller, fastened to ropes which two or three men held at a distance for fear of accidents, descended as near as possible to the brink of the gulph; but the small flames and smoke which issued from it on every side, and a greenish sulphur and pumice-stones, quite black, which covered the margin, would not permit them to come so near as to have a full view. They only saw distinctly in the middle, a mass of matter which rose, in the shape of a cone, to the height of sixty feet, and which towards the base, as far as their sight could reach, might be 600 or 800. While they were observing this substance, some motion was perceived on the north side, opposite to that whereon they stood; and immediately the mountain began to send forth smoke and ashes. This eruption was preceded by a sensible increase of its internal roarings; which, however, did not continue; but after a moment's dilatation, as if to give it vent, the volcano resumed its former tranquillity; but as it was by no means proper to make a long stay in such a place, our travellers immediately returned to their attendants.

On the summit of mount Ætna, Mr. Hamilton was sensible of a difficulty in respiration from the too great subtilty of the air, independent of what arose from the sulphureous smoke of the mountain. Mr. Brydone takes no notice of this; which probably arose from the air being in a more rarefied state at the time of Mr. Hamilton's observation, than of Mr. Brydone's; the barometer, as observed by the former, standing at eighteen inches and ten lines, by the latter at nineteen inches six and one half lines.

In these high regions there is generally a very violent wind, which, as all our travellers found it constantly blowing from the south, may possibly be commonly directed from that point. Here Mr. Brydone's thermometer fell to 27°.

The top of Ætna being above the common region of vapours, the heavens appear with exceeding great splendor.—Mr. Brydone and his company observed, as they ascended in the night, that the number of stars seemed to be infinitely increased, and the light of each of them appeared brighter than usual; the whiteness of the milky way was like a pure flame which shone across the heavens; and, with the naked eye, they could observe clusters of stars that were invisible from below. Had Jupiter been visible, he is of opinion that some of his satellites might have been discovered with the naked eye, or at least with a very small pocket-glass. He likewise took notice of several of those meteors called *falling-stars*; which appeared as much elevated as when viewed from the plain; a proof, according to Mr. Brydone, that “these bodies move in regions much beyond the bounds that some philosophers have assigned to our atmosphere.”

To have a full and clear prospect from the summit of mount Ætna, it is necessary to be there before sun-rise; as the vapours raised by the sun, in the day-time, will obscure every

object: accordingly, our travellers took care to arrive there early enough; and all agree, that the beauty of the prospect from thence cannot be expressed.—Here Mr. Brydone and Mr. Hamilton had a view of Calabria in Italy, with the sea beyond it; the Lipari islands, and Stromboli, a volcano at about seventy miles distance, appeared just under their feet; the whole island of Sicily, with its rivers, towns, harbours, &c. appeared distinct, as if seen on a map. Malfa, a Sicilian author, affirms, that the African coast as well as that of Naples, with many of its islands, have been discovered from the top of Ætna. The visible horizon here, is not less than 800 or 900 miles in diameter. The pyramidal shadow of the mountain reaches across the whole island, and far into the sea on the other side, forming a visible tract in the air, which, as the sun rises above the horizon, is shortened, and at last confined to the neighbourhood of Ætna. The most beautiful part of the scene, however, in Mr. Brydone's opinion, is the mountain itself, the island of Sicily, and the numerous islands lying round it. These last seem to be close to the skirts of Ætna; the distances appearing reduced to nothing.

This mountain is divided into three zones, which might properly enough be distinguished by the names of *torrid*, *temperate*, and *frigid*: they are, however, known by the names of the *Piedmontese*, or *Regione culta*, the cultivated, or fertile region; the *Sylvestra*, woody, or temperate zone; and the *Regione deserta*, the frigid, or desert zone, or region. All these are plainly distinguished from the summit. The *Regione deserta* is marked out by a circle of snow and ice, which extends on all sides to the distance of about eight miles, beginning at the foot of the crater. Greatest part of this region is smooth and even. This is immediately succeeded by the *Sylvestra*, or woody regions; which forms a circle of the most beautiful green, surrounding the mountain on all sides. This region is variegated with a vast number of mountains of a conical form, thrown up by Ætna in those eruptions which burst out from its sides. Mr. Hamilton counted forty-four on the Catania side, each having its crater, many with large trees flourishing both within and without the crater. All these, except a few of late date, have acquired a wonderful degree of fertility. The circumference of this zone, or great circle, according to Recupero, is not less than seventy or eighty miles. It is everywhere succeeded by the *Regione culta*; which is much broader than the rest, and extends on all sides to the foot of the mountain. Here terrible devastations are sometimes committed by the eruptions; and the whole region is likewise full of conical mountains thrown up by them. The circumference of this region is, by Recupero, reckoned 183 miles; but we have already given our reasons for rejecting these dimensions.—This region is bounded by the sea to the south and south-east; and on all other sides by the rivers Semeus and Alcantara, which form the boundaries of mount Ætna.

About a mile below the foot of the great crater, are found the ruins of an ancient structure, called *Il Torre del Filosofo*, by some supposed to have been built by the philosopher Empedocles, who took up his habitation here, the better to study the nature of mount Ætna. By others they are supposed to be ruins of a temple of Vulcan. They are of brick, and seem to have been ornamented with marble. Somewhere in this region also, Mr. D'Orville found a great oblong block of polished marble, eight or ten feet high, and three or four thick; though how it came there was quite unaccountable to him. From Mr. D'Orville's and Mr. Brydone's accounts, we must reckon this part of the mountain pretty steep: but Mr. Hamilton says, that the ascent was so gradual, as not to be in the least fatiguing; and had it not been for the snows, they might have rode on their mules to the very foot of the crater.

The woody region descends eight or nine miles below the

Regione deserta, but differs greatly in the temperature of its climate. Mr. Hamilton observed a gradual decrease of the vegetation as he advanced; the under part being covered with large timber trees, which grew gradually less as he approached the third region, at last they degenerated into the small plants of the northern climates. He also observed quantities of juniper and tansey; and was informed by his guide, that later in the season (he visited Ætna in June 1769) there are a great many curious plants, and in some places rhubarb and saffron in great plenty. In Carrera's history of Catania, there is a list of all the plants and herbs of Ætna, in alphabetical order.

This region is extolled by Mr. Brydone as one of the most delightful spots on earth. He lodged for a night in a large cave near the middle, formed by one of the most ancient lavas. It is called *La Spelonca del Capriolo*, or the goats cavern; because it is frequented by those animals, which take refuge there in bad weather. Here his rest was disturbed by a mountain thrown up in the eruption 1766. It discharged great quantities of smoke, and made several explosions like heavy cannon fired at a distance; but they could observe no appearance of fire.

This gentleman likewise visited the eastern side of the *Regione sylvestra*, intending to have ascended that way to the summit, and descended again on the south side to Catania; but found it impracticable; though what the insurmountable difficulties were, he does not mention. On this side, part of the woody region was destroyed, in 1755, by an immense torrent of boiling water, which issued from the great crater. Its traces were still very visible, about a mile and a half broad, and in some places more. The soil was then only beginning to recover its vegetative power, which it seems this torrent had destroyed for 14 years.—Near this place are some beautiful woods of cork, and evergreen oak, growing absolutely out of the lava, the soil having hardly filled the crevices; and not far off, our traveller observed seven little mountains that seemed to have been formed by a late eruption. Each of these had a regular cup, or crater, on the top; and, in some, the middle gulph, or *Voragine*, as the Sicilians call it, was still open. Into these gulphs Mr. Brydone tumbled down stones, and heard the noise for a long time after. All the fields round, to a considerable distance, were covered with large burnt stones discharged from these little volcanoes.

The woody region, especially the east side, called *Carpinetta*, abounds with very large chestnut-trees; the most remarkable of which has been called, from its size, *Castagno de Cento Cavalli*, or chestnut-tree of a hundred horses. Mr. Brydone was greatly disappointed at the sight of this tree, as it is only a bush of five large ones growing together: but his guides assured him, that all these five were once united into one stem; and Signor Recupero told him, that he himself had been at the expense of carrying up peasants with tools to dig round this bush of trees, and found all the stems united below ground in one root. The circumference, as measured by Messrs Brydone and Glover, who accompanied him, amounted to 204 feet. Another of these, about a mile and a half higher on the mountain, is called *Castagna del Galea*: it rises from one solid stem to a considerable height; after which it branches out, and is a much finer object than the other: this was measured two feet above the ground, and found to be 76 feet in circumference. A third, called *Castagna dei Nove*, is pretty nearly of the same size; and Malfa, one of the most esteemed Sicilian authors, affirms that he has seen solid oaks there upwards of 40 feet round. All these grow on a thick rich soil, which seems originally to have been formed of ashes thrown out by the mountain. Here the barometer stood at 26 inches 5 lines and a half, indicating an elevation of near 4000 feet.

The Piedmontese district is covered with towns, villages, monasteries, &c. and is well peopled, notwithstanding the danger of such a situation: but the fertility of the soil tempts people to inhabit that country; and their superstitious confidence in their saints, with the propensity mankind have to despise danger which they do not feel, render them as secure there as in any other place. Here, Sir William Hamilton observes, they keep their vines low, contrary to the custom of those who inhabit mount Vesuvius; and they produce a stronger wine, but not in such abundance: here also many terrible eruptions have burst forth; particularly one in 1669. At the foot of the mountain raised by that eruption; is a hole, through which Sir William Hamilton descended, by means of a rope, into several subterraneous caverns, branching out, and extending much farther than he chose to venture, the cold there being excessive, and a violent wind extinguishing some of the torches. Many other caverns are known in this and the other regions of Ætna; particularly one near this place called *La Spelonca della Palomba* (from the wild pigeons building their nests there). Here Mr. Brydson was told that some people had lost their senses, from having advanced too far, imagining they saw devils and damned spirits.—Some of these caverns are made use of as magazines for snow; which they are well adapted for, on account of their extreme cold. These are with great probability supposed by Sir William Hamilton to be the hollows made by the issuing of the lava in eruptions.

In this region the river *Acis*, so much celebrated by the poets, in the fable of *Acis* and *Galatea*, takes its rise. It bursts out of the earth at once in a large stream, runs with great rapidity, and about a mile from its source throws itself into the sea. Its water is remarkably clear; and so extremely cold, that it is reckoned dangerous to drink it: it is said, however, to have a poisonous quality, from being impregnated with vitriol; in consequence of which, cattle have been killed by it. It never freezes, but is said often to contract a greater degree of cold than ice.

Having thus given an account of this mountain in its quiet and peaceable state, we must now describe the appearance it puts on during the time of an eruption, when it spreads destruction for many miles round, and is capable of striking the boldest with terror.—Here we are surprised to find ourselves at a loss; for though there are many particular accounts of the eruptions of Vesuvius, we cannot, after the most diligent search, find that any writer hath accurately described the phenomena attending an eruption of Ætna.—Borelli, indeed, an Italian writer, published a natural history of this mountain for the year 1669, when a very terrible eruption happened; but as this treatise is not now to be found, in this part of the world at least, we must supply the deficiency in the best manner we can, by such hints as can be obtained from the writings of Sir William Hamilton and Mr. Brydson, together with a very imperfect account given by some English merchants who happened to be in Catania at that time, and recorded in the Philosophical Transactions, No. 51.

Sir William Hamilton, who has examined both Vesuvius and Ætna in a very accurate manner, never had an opportunity of seeing an eruption of the latter; but as he is of opinion that the two volcanoes agree perfectly in all respects, only that the latter is on a much larger scale than the former, we hope it will not be unacceptable to our readers to give an account of some of the general appearances of Vesuvius when in a state of eruption, the better to help their ideas concerning Ætna.

It has been already observed, that a smoke constantly issues from the top of Ætna, and that its internal noises never cease. The case is the same with Vesuvius: and Sir William Hamilton observed, that in bad weather the smoke was more

considerable, as well as the noises much louder, than when it was fair; so that in bad weather he had frequently heard the inward explosions of the mountain at Naples, six miles distant from Vesuvius. He also observed the smoke that issued from the mountain in bad weather to be very white, moist, and not near so offensive as the sulphureous streams from various cracks in the side of the mountain.

The first symptom of an approaching eruption is an increase of the smoke in fair weather: after some time, a puff of black smoke is frequently seen to shoot up in the midst of the white, to a considerable height. These puffs are attended with considerable explosions: for while Vesuvius was in this state, Sir William Hamilton went up to its top, which was covered with snow; and perceiving a little hillock of sulphur, about six feet high, which had been lately thrown up, and burnt with a blue flame at the top, he was examining this phenomenon, when suddenly a violent report was heard, a column of black smoke shot up with violence, and was followed by a reddish flame. Immediately a shower of stones fell; upon which he thought proper to retire. Phenomena of this kind, in all probability, precede the eruptions of Ætna, in a much greater degree.—The smoke at length appears wholly black in the day-time, and in the night has the appearance of flame; showers of ashes are sent forth, earthquakes are produced, the mountain discharges volleys of red-hot stones to a great height in the air. The force by which these stones are projected, as well as their magnitude, seems to be in proportion to the bulk of the mountain. Signior Recupero assured Mr. Brydson, that he had seen immensely large ones thrown perpendicularly upwards to the height of 7000 feet, as he calculated from the time they took to arrive at the earth after beginning to descend from their greatest elevation. The largest stone, or rather rock, that was ever known to be emitted by Vesuvius, was 12 feet long, and 45 in circumference. This was thrown a quarter of a mile; but much larger ones have been thrown out by mount Ætna, almost in the proportion in which the latter exceeds Vesuvius in bulk. Along with these terrible symptoms, the smoke that issues from the crater is sometimes in a highly electrified state. In this case, the small ashes which are continually emitted from the crater, are attracted by the smoke, and rise with it to a great height, forming a vast black, and to appearance dense, column; from this column continual flashes of forked or zig-zag lightning issue, sometimes attended with thunder, and sometimes not, but equally powerful with ordinary lightning. This phenomenon was observed by Sir William Hamilton in the smoke of Vesuvius, and has also been taken notice of in that of Ætna; and where this electrified smoke hath spread over a tract of land, much mischief hath been done by the lightning proceeding from it.

When these dreadful appearances have continued sometimes four or five months, the lava begins to make its appearance. This is a stream of melted mineral matters, which in Vesuvius commonly boils over the top; but very seldom does so in Ætna; owing to the great weight of the lava, which, long before it can be raised to the vast height of mount Ætna, bursts out through some weak place in its side. Upon the appearance of the lava, the violent eruptions of the mountain generally, though not always, cease; for if this burning matter gets not sufficient vent, the commotions increase to a prodigious degree.—In the night-time the lava appears like a stream of fire, accompanied with flame: but in the day-time it has no such appearance; its progress is marked by a white smoke, which by the reflection of the red-hot matter in the night assumes the appearance of flame. All the above-mentioned symptoms preceded the great eruption of Ætna in 1669. As we cannot find a particular account of what happened at the breaking forth of the lava in mount Ætna in 1669, we

must content ourselves with giving the reader some idea of this tremendous process of nature from Sir William Hamilton's account of the breaking forth of the lava in Vefuvius, no more than a quarter of a mile's distance from the place where he stood. "I was making my observations," says he, "on the lava, which had already, from the spot where it first broke out, reached the valley; when, on a sudden, about noon, I heard a violent noise within the mountain, and about a quarter of a mile off the place where I stood; the mountain split, and with much noise; from this new mouth, a fountain of liquid fire shot up many feet high, and then, like a torrent, rolled on directly towards us. The earth shook, at the same time that a volley of pumice-stones fell thick upon us; in an instant, clouds of black smoke and ashes caused almost a total darkness; the explosions from the top of the mountain were much louder than any thunder I ever heard, and the smell of sulphur was likewise very offensive. My guide, alarmed, took to his heels; and I must confess I was not at my ease. I followed close, and we ran near three miles without stopping; as the earth continued to shake under our feet, I was apprehensive of the opening of a fresh mouth, which might have cut off our retreat. I also feared that the violent explosions would detach some of the rocks off the mountain of Somma, under which we were obliged to pass; besides, the pumice-stones, falling upon us like hail, were of such a size as to cause a disagreeable sensation upon the part where they fell. After having taken breath, as the earth still trembled greatly, I thought it most prudent to leave the mountain and return to my villa; where I found my family in a great alarm at the continual and violent explosions of the volcano, which shook our house to its very foundation, the doors and windows swinging upon their hinges.—The noise and smell of sulphur increasing, we removed from our villa to Naples: and I thought proper, as I passed by Portici, to inform the court of what I had seen; and humbly offered it as my opinion, that his Sicilian majesty should leave the neighbourhood of the threatening mountain.—I observed, in my way to Naples, which was in less than two hours after I had left the mountain, that the lava had actually covered three miles of the very road through which we had retreated. It is astonishing that it should have run so fast; as I have since seen, that the river of lava in the *Atrio di Cavallo* was 60 and 70 feet deep, and in some places near two miles broad. When his Sicilian majesty quitted Portici, the noise was greatly increased; and the concussion of the air from the explosions was so violent, that, in the king's palace, doors and windows were forced open, and even one door there, which was locked, was nevertheless burst open. At Naples, the same night, many windows and doors flew open: (the windows at Naples open like folding-doors). In my house, which is not on the side of the town next Vefuvius, I tried the experiment of unbolting my windows, when they flew wide open upon every explosion of the mountain. Besides these explosions, which were very frequent, there was a continued subterraneous and violent rumbling noise, which lasted this night about five hours."

No doubt the same terrible appearances are put on by *Ætna* at the time its lavas break forth; but in a much greater degree, in proportion to the superior size of the mountain.—The appearance, and indeed the effects, of the lava itself, are very dreadful. When it first issues, the lava appears very fluid, and runs with the rapidity of a swift river: but even then it surprisingly resists the impression of solid bodies; for Sir William Hamilton could not pierce that of Vefuvius with a stick driven against it with all his force; nor did the largest stone he was able to throw upon it sink, but made a slight impression, and then floated along. This happened almost at the very mouth, when the lava appeared liquid as water, and

when he saw it running with a rapidity equal to the river Severn at the passage near Bristol.—A description of the lava issuing from mount *Ætna* in 1669 was sent to the court of England by Lord Winchelsea, who at that time happened to be at Catania in his way home from an embassy at Constantinople. His account is not now to be procured; but Mr. Hamilton found a copy in Sicily, and hath given an extract, part of which follows. "When it was night, I went upon two towers in divers places; and I could plainly see, at ten miles distance, as we judged, the fire begin to run from the mountain in a direct line, the flame to ascend as high and as big as one of the greatest steeples in your majesty's kingdoms, and to throw up great stones into the air; I could discern the river of fire to defend the mountain of a terrible fiery or red colour, and stones of a paler red to swim thereon, and to be some as big as an ordinary table. We could see this fire to move in several other places, and all the country covered with fire, ascending with great flames in many places, smoking like to a violent furnace of iron melted, making a noise with the great pieces that fell, especially those that fell into the sea. A cavalier of Malta, who lives there, and attended me, told me, that the river was as liquid, where it issues out of the mountain, as water, and came out like a torrent with great violence, and is five or six fathom deep, and as broad, and that no stones sink therein."

The account given in the Philosophical Transactions is to the same purpose. We are there told, that the lava is "nothing else than diverse kinds of metals and minerals, rendered liquid by the fierceness of the fire in the bowels of the earth, boiling up and gushing forth as the water doth at the head of some great river; and having run in a full body for a stone's cast or more, began to crust or curdle, becoming, when cold, those hard porous stones which the people call *Sciarrì*." Those, though cold in comparison of what first issues from the mountain, yet retained so much heat as to resemble huge cakes of sea-coal strongly ignited, and came tumbling over one another, bearing down or burning whatever was in their way.—In this manner the lava proceeded slowly on till it came to the sea, when a most extraordinary conflict ensued betwixt the two adverse elements. The noise was vastly more dreadful than the loudest thunder, being heard through the whole country to an immense distance; the water seemed to retire and diminish before the lava, while clouds of vapour darkened the sun. The whole fish on the coast were destroyed; the colour of the sea itself was changed, and the transparency of its waters lost for many months.

While this lava was issuing in such prodigious quantity, the merchants, whose account is recorded in the Philosophical Transactions, attempted to go up to the mouth itself; but durst not come nearer than a furlong, lest they should have been overwhelmed by a vast pillar of ashes, which to their apprehension exceeded twice the bigness of St. Paul's steeple in London, and went up into the air to a far greater height; at the mouth itself was a continual noise, like the beating of great waves of the sea against rocks, or like distant thunder, which sometimes was so violent as to be heard 60, or even 100 miles off, to which distance also part of the ashes were carried.—Some time after, having gone up, they found the mouth from whence this terrible deluge issued to be only a hole about 10 feet diameter. This is also confirmed by Mr. Brydone: and is probably the same through which Sir William Hamilton descended into the subterranean caverns already mentioned.

Mount *Ætna*, as we have already remarked, has been a celebrated Volcano from the remotest antiquity. Diodorus Siculus mentions eruptions of it as happening 500 years before the Trojan war, or 1693 years before the Christian era,

Many others are recorded by historians in different ages, but none are particularly described. The mountain seems sometimes to lie dormant for many years, or even centuries; when it breaks out again with great fury, and will sometimes burn for years together. Since 1669 there have been several eruptions, but none of them comparable to that one. The last happened in 1766. The lava sprang up into the air to a considerable height, twelve miles below the summit; but formed a stream only six miles in length, and one mile in breadth.

The extent, antiquity, &c. of the lavas, as well as the opinions of philosophers concerning the origin of the internal fire, are subjects which belong to the general article VOLCANO.

AFER (Domitius), born at Nîmes, a famous orator under Tiberius and the three succeeding emperors. Quintilian makes frequent mention of him, and commends his pleadings. But he disgraced his talents, by turning informer against some of the most distinguished personages in Rome. He died A.D. 59.

AFFINITY, in Chemistry (*Encycl.*). See CHEMISTRY. Consult also the copious tables given under ELECTIVE Attraction.

AFGHANS, are a people in India who inhabit a province of CABUL or CABULISTAN (see *Encycl.*), and have always been connected with the kingdoms of Persia and Hindostan. They boast of being descended from Saul the first king of Israel; of whose advancement to the royal dignity they give an account which deviates not very widely from the truth. They say indeed, that their great ancestor was raised from the rank of a shepherd, not from any princely qualities which he possessed, but because his stature was exactly equal to the length of a rod which the angel Gabriel had given to the prophet Samuel as the measure of the stature of him whom God had destined to fill the throne of Israel.

SAUL, whose descent, according to some of them, was of Judah, and according to others of Benjamin, had, they say, two sons, BERKIA and IRMIA, who served David, and were beloved by him. The sons of Berkia and Irmia were AFGHAN and USEBK, who during the reigns of David and Solomon, distinguished themselves, the one for his corporeal strength, and the other for his learning. So great indeed was the strength of *Afghan*, that we are told it struck terror even into demons and genii.

This hero used frequently to make excursions to the mountains, where his progeny, after his death, established themselves, lived in a state of independency, built forts, and exterminated infidels. When the select of creatures (the appellation which this people gave to *Mahomet*) appeared upon earth, his fame reached the *Afghans*, who fought him in multitudes under their leaders *Khalid* and *Abdul Kefid*, sons of *Walid*; and the prophet honouring them with this reception—"Come, O *Mulhe*, or Kings!" they assumed the title of *Melic*, which they retain to this day.

The history, from which this abstract is taken, gives a long and uninteresting detail of the exploits of the *Afghans*, and of their zeal in overthrowing the temples of idols. It boasts of the following monarchs of their race who have sat upon the throne of *Delhi*: Sultan BEHLOLE, *Afghan* LODI, Sultan SECANDER, Sultan IBRAHIM, SHIR SHAH, ISLAM SHAH, ADIL SHAH SUR. It also numbers the following kings of *Gaur* descended from the *Afghan* chiefs: SOLAIMAN *Shah Garzani*, BEYAZID *Shah*, and KUTB *Shah*; besides whom, their nation, we are told, has produced many conquerors of provinces. The *Afghans* are sometimes called *Solaimani*, either because they were formerly the subjects of Solomon king of Israel, or because they inhabit the mountains of Solomon. They are likewise called *PATANS*, a name derived from the

Hindi verb *Paitna* "to rush," which was given to them by one of the Sultans whom they served, in consequence of the alacrity with which they had attacked and conquered his enemies. The province which they occupy at present was formerly called *Roh*; and hence is derived the name of the *Rohillas*. The city which was established in it by the *Afghans* was called by them *Paishawer* or *Paikher*, and is now the name of the whole district. The sects of the *Afghans* are very numerous; of which the principal are, *Lodi*, *Lohouni*, *Sur*, *Servani*, *Tufufzabi*, *Bangish*, *Dilazani*, *Kbetti*, *Tafin*, *Khalil*, and *Beleje*. They are *Muhammants*, partly of the *Sunni*, and partly of the *Shiik* persuasion.

Though they are great boasters, as we have seen, of the antiquity of their origin, and the reputation of their race, other *Muhammants* reject their claim, and consider them as of modern, and even of base, extraction.

This is probably a calumny; for it seems inconsistent with their attention to the purity of their descent—an attention which would hardly be paid by a people not convinced of their own antiquity. They are divided into four classes. The first is the *pure* class, consisting of those whose fathers and mothers were *Afghans*. The second class consists of those whose fathers were *Afghans* and mothers of another nation. The third class contains those whose mothers were *Afghans* and fathers of another nation. The fourth class is composed of the children of women whose mothers were *Afghans* and fathers and husbands of a different nation. Persons who do not belong to one of these classes are not called *Afghans*.

This people have at all times distinguished themselves by their courage, both singly and unitedly, as principals and auxiliaries. They have conquered for their own princes and for foreigners, and have always been considered as the main strength of the army in which they served. As they have been applauded for virtues, they have also been reproached for vices, having sometimes been guilty of treachery, and of acting the base part even of assassins.

Such is the account of the *Afghans* published in the second volume of the *Asiatic Researches*. It was translated from a Persian abridgment of a book written in the Pushto language, and called *The Secrets of the Afghans*, and communicated by Henry Vanittart, esq. to Sir William Jones, then president of the Asiatic Society. Their claim to a descent from Saul king of Israel, whom they called MELIC TALUT, is probably of not a very ancient date; for the introduction of the angel Gabriel with his rod, gives to the whole story the air of one of those many fictions which Mahomet borrowed from the later rabbins. Sir William Jones, however, though he surely gave no credit to this fable, seems to have had no doubt but the *Afghans* are descendants of Israel. "We learn (says he) from ESDRAS, that ten tribes, after a wandering journey, came to a country called *Arjareth*, where we may suppose they settled; now the *Afghans* are said by the best Persian historians to be descended from the Jews. They have traditions among themselves of such a descent; and it is even asserted, that their families are distinguished by the names of Jewish tribes, although, since their conversion to *Islam*, they studiously conceal their origin from all whom they admit not to their secrets. The Pushto language, of which I have seen a dictionary, has a manifest resemblance to the Chaldaic; and a considerable district under their dominion is called *Hazareth*, or *Hazaret*, which might easily have been changed into the word used by ESDRAS. I strongly recommend an enquiry into the literature and history of the *Afghans*."

A circumstantial account of the *Afghans* has been written by a late Chief of the *Rohillahs*, HAFIZ RHAMAT Khan; and from this work the oriental scholar may derive much useful information.

AFRANIUS, a Latin poet, who wrote comedies in imita-

tion of Menander, commended by Tally and Quintilian: he lived in the 170th Olympiad.

AFRICANUS (Julius), an excellent historian of the third century, the author of a chronicle which was greatly esteemed, and in which he reckons 5500 years from the creation of the world to Julius Cæsar. This work, of which we have now no more than what is to be found in Eusebius, ended at the 221st year of the vulgar æra. Africanus also wrote a letter to Origen on the history of Sufama, which he reckoned supposititious; and we have still a letter of his to Arillides, in which he reconciles the seeming contradictions in the two genealogies of Christ recorded by St. Matthew and St. Luke.

AFRIQUE, St. a small town in France, in the department of Aveiron, late Rouergue; 6 miles E. of Vabres.

AGA (*Encycl.*). The aga of the janissaries is the only person who is allowed to appear before the Grand Signior without his arms across his breast in the posture of a slave. Eunuchs at Constantinople are in possession of most of the principal posts of the seraglio: the title *aga* is given to them all, whether in employment or out. For some years, the *aga* of Algiers was the supreme officer; and governed the state in the place of bashaw, whose power dwindled to a shadow. But the soldiery rising against the *bashuk bashis*, or *agas*, massacred most of them, and transferred the sovereign power to the calif, with the title of *Dei*, or King.

AGAMEMNON, the son of Atreus by Erope, was captain-general of the Trojan expedition. It was foretold to him by Cassandra, that his wife Clytemnestra would be his death: yet he returned to her: and accordingly was slain by Ægisthus, who had gained upon his wife in his absence, and by her means got the government into his own hands.

AGAMENTICUS, a mountain of North America, in the province of Main. It is a noted landmark for sailors, about eight miles from the sea, in lat. 43. 16. a few miles westward from Wells.

AGANIPPE (*Encycl.*). This fountain was sacred to the muses, and ran into the river Permeus; (Pliny, Pausanias). Ovid seems to make *Aganippe* and *Hippocrene* the same. Solinus more truly distinguishes them, and ascribes the blending them to poetical licence.

AGARD (Arthur), a learned English antiquarian, born at Toston in Derbyshire, in the year 1540. His fondness for English antiquities induced him to make many large collections; and his office as deputy chamberlain of the exchequer, which he held 45 years, gave him great opportunities of acquiring skill in that study. Similarity of taste brought him acquainted with Sir Robert Cotton, and other learned men, who associated themselves under the name of *The Society of Antiquarians*, of which society Mr. Agar was a conspicuous member. He made the doom-day-book his peculiar study; and composed a work purposely to explain it, under the title of *Tractatus de usu et obscurioribus verbis libri de Domesday*: he also compiled a book for the service of his successors in office, which he deposited with the officers of the king's receipt, as a proper index for succeeding officers. All the rest of his collection, containing at least twenty volumes, he bequeathed to Sir Robert Cotton; and died in 1615.

AGATHA, St. a town in the kingdom of Naples, with a bishop's see. It is 20 miles N. E. of Naples. Long. 14. 36. E. lat. 41. 5. N.

AGATHIAS, or as he calls himself in his epigrams, **AGATHRIUS**, distinguished by the title of *Sebastianus*, a Greek historian in the 6th century under Justinian. He was born at Myrina, a colony of the ancient Ælians, in Asia the Less, at the mouth of the river Phrygius. He was an advocate at Smyrna. Though he had a taste for poetry, he was yet more famous for his history, which begins with the 20th year of

Justinian's reign, where Procopius ends. It was printed in Greek and Latin, with Bonaventure Vulcanius's, at Leyden, 1594, in 4to.; and in Paris at the king's printing-house, 1660, in folio.

AGATHO, a tragic and comic poet, disciple to Prodicus and Socrates, applauded in Plato's dialogues for his virtue and beauty. His first tragedy obtained the prize; and he was crowned in the presence of upwards of 30,000 men, the 4th year of the 90th Olympiad. There is nothing now extant of his, except a few quotations in Aristotle, Athenæus, and others.

AGATHOCLES, the famous tyrant of Sicily, son of a potter at Reggio. He was a thief, common soldier, centurion, general, and a pirate, all in a regular succession. He defeated the Carthaginians several times in Sicily, and was once defeated himself. He first made himself tyrant of Syracuse, and then of all Sicily; after which, he vanquished the Carthaginians again both in Sicily and Africa. But at length having ill success, and being in arrears with his soldiers, they mutinied, forced him to fly his camp, and cut the throats of his children, whom he left behind. Recovering himself again, he relieved Corfu, besieged by Cassander; burnt the Macedonian fleet; returned to Sicily, murdered the wives and children of those who had murdered his; afterwards meeting with the soldiers themselves, he put them all to the sword; and ravaging the sea-coast of Italy, took the city of Hipponium. He was at length poisoned by his grandson Archagathus, in the 72d year of his age, 250 years before Christ, having reigned 28 years.

AGATHYRNA, or **AGATHYENUM**, **AGATHYRSA** (Polybius); **AGATHYRSUM** (Strabo); a town of Sicily; now *S. Marco*; as old as the war of Troy, being built by Agathyrus, son of Æolus, on an eminence. The gentilitious name is *Agathyrneus*; or, according to the Roman idiom, *Agathyrnenis*.

AGATTON, a town near the mouth of the Formoso, on the coast of Guinea, 80 miles S. of Benin. Long. 7. 6. E. Lat. 7. 20. N.

AGDE (*Encycl.*), a town of France, situated in the department of Herault and late province of Languedoc; with a bishop's see. The diocese is small, but it is one of the richest countries in the kingdom. It produces fine wool, wine, oil, corn, and silk. It is seated on the river Herault, a mile and a quarter from its mouth, where it falls into the gulph of Lyons, and where there is a fort built to guard its entrance. It is well peopled; the houses are built of black stone, and there is an entrance into the city by four gates. The greatest part of the inhabitants are merchants or seamen. The public buildings are but mean; the cathedral is small, and not very handsome: the bishop's palace is an old building, but convenient enough. The city is extended along the river, where it forms a little port, wherein small craft may enter. Before the revolution, there was a great concourse of pilgrims and other devout people to the chapel of Notre Dame de Grace. It is a little without the city, between which and the chapel there are about 13 or 14 oratories, which they visited with naked feet. The convent of the Capuchins is well built, and on the outside are lodgings and apartments for the pilgrims who came to perform their *neuvaine* or nine days' devotion. The chapel is distinct from the convent.

AGENABAT, a town of Transylvania, 10 miles N. E. of Hermanstadt. Long. 24. 50. E. Lat. 46. 32. N.

AGENORIA, in mythology, the goddess of courage and industry, as *Vacuna* was of indolence.

AGER, a town of Catalonia, in Spain. Long. 1. 50. E. Lat. 41. 50. N.

AGER PICENUS (Cicero, Sallust, Livy); and sometimes

Picenum (Cæsar; Pliny); a territory of Italy to the south-east of Umbria, reaching from the Apennine to the Adriatic. The people are called *Picentes* (Cicero, Livy); distinct from the Picentini on the Tulfcan fea, though called by Greek writers Πικεντινοι. This name is faid to be from the bird *Picus*, under whose conduct they removed from the Sabines, of whom they were a colony.

AGESILAUS, king of the Lacedæmonians, the fon of Archidamus, was raifed to the throne notwithstanding the fuperior claim of Leotychides. As foon as he came to the throne, he advifed the Lacedæmonians to be beforehand with the King of Perfia, who was making great preparations for war, and to attack him in his own dominions. He was himfelf chofen for this expedition; and gained fo many advantages over the enemy, that if the league which the Athenians and the Thebans formed againft the Lacedæmonians had not obliged him to return home, he would have carried his victorious arms into the very heart of the Perfian empire. He gave up, however, all thefe triumphs readily, to come to the fuccour of his country, which he happily relieved by his victory over the allies in Boetia. He obtained another near Corinth; but to his great mortification, the Thebans afterwards gained feneral over the Lacedæmonians. Thefe misfortunes at firft raifed fomewhat of a clamour againft him. He had been fick during the firft advantages which the enemy gained; but as foon as he was able to act in perfon, by his valour and prudence he prevented the Thebans from reaping the advantages of their victories; infomuch that it was generally believed, had he been in health at the beginning, the Lacedæmonians would have fufained no loffes, and that all would have been loft had it not been for his affiftance. It cannot be denied but he loved war more than the intereft of his country required; for if he could have lived in peace, he had faved the Lacedæmonians feveral loffes, and they would not have been engaged in many enterprifes which in the end contributed much to weaken their power. He died in the third year of the 104th Olympiad, being the 84th year of his age, and 41ft year of his reign.

AGESIPOLIS I. king of Lacedæmon, fucceeded his father Pausanias, colleague of Agesilaus II. He ravaged the country of Mantinea, fubdued that city, and pillaged Olynthia. He died about 380 years before Jefus Chrift, and was embalmed in honey, according to the cuftom of the Lacedæmonians. He died without ifue, and was fucceeded by Cleombrotus his brother, the father of Agesipolis II. who was more remarkable for his apophthegms than his actions.

AGIMERE, or **AZMERE**, the capital of a territory of the fame name in Hindooftan Proper, built at the foot of a very high mountain; on the top of which is a fortrefs of great ftrength. It is about 230 miles by the road W. from Agra; and yet the famous emperor Achar, fays Major Rennell, made a pilgrimage on foot, to the tomb of a faint there, to implore the divine bleffing on his family, which at that time confifted only of daughters: but after this pilgrimage, he had three fons added to it. Jehanguire, his fon, occasionally kept his court here; and this occafioned the vifits of Sir Thomas Roe to this place from Surat. Long. 75. 20. E. Lat. 26. 35. N.

AGISYMBLA (anc. geog.), a diftrict of Libya Interior, according to Agathemerus, fituated to the fouth-eaft of the Æthiopes Anthropophagi; the parallel paffing through which, at 16° to the fouth of the equator, was the utmoft extent of the knowledge of the ancients to the fouth (Ptolemy).

AGLIONBY (John), an Englifh divine, chaplain in ordinary to king James I. a man of univerfal learning, who had a very confiderable hand in the tranflation of the New Teftament appointed by King James I. in 1604.

AGMAT, a town of Africa, on the river of the fame name,

in Morocco. It is feated on the declivity of one of the mountains of Atlas, where the air is good, and the country fertile, 16 miles S. of Morocco. Long. 7. 15. W. Lat. 30. 56. N.

AGNADELLOA, a village of the Milanefe, famous for two battles: the firft, in 1509; the fecond, in 1705. It is feated on the canal between Adda and Serio, five miles S. E. of Caffiana. Long. 9. 26. E. Lat. 45. 25. N.

AGNANO, a circular lake, in the kingdom of Naples, feven miles from Puzzoli. It is about half a mile in diameter, furrounded by mountains; and on its margin is fituated the famous Grotta del Cane.

AGNOETE (*Encycl.*). Eulogius, patriarch of Alexandria, afcribes this hereby to certain folitaries in the neighbourhood of Jerufalem, who built their opinion upon the text Mark xiii. 32. "Of that day and hour knoweth no man, no not the angels who are in heaven; neither the Son, but the Father only."—The fame paffage was made ufe of by the Arians; and hence the orthodox divines of thofe days were induced to give various explications thereof. Some allege, that our Saviour here had no regard to his divine nature, but only fpoke of his human. Others underftand it thus, That the knowledge of the day of judgment does not concern our Saviour confidered in his quality of Mefiah, but God only: which is the moft natural folution.

AGNON, a small river of Bourgogne in France, otherwife called *Ignon*.

AGNONE, a city of the kingdom of Naples, in the province of the Higher Abruzzo, called by fome *Ancione*.

AGON (*Encycl.*). Among the games of this kind celebrated at Athens, were the *agon gymnicus*, the *agoneus* inflituted by the Argives in the 53d Olympiad, and the *agon olympicus* inflituted by Hercules 450 years before the firft Olympiad. The Romans alfo in imitation of the Greeks, inflituted contefts of this kind. The emperor Aurelian eftablifhed one under the name of *agon folis*, the conteft of the fun; Dioclefan another, which he called *agon capitulinus*, which was celebrated every fourth year, after the manner of the Olympic games. Hence the years, inftead of *lustra*, are fometimes numbered by *agones*.

AGONY, any extreme pain. It is alfo ufed for the pangs of death. Much of the terror of death confifts in the pangs and convulfions wherewith the agony feems attended; though we have reafon to believe, that the pain in fuch cafes is ordinarily not extremely acute; a courfe of pain and ficknels having ufually ftupified and indifpofed the nerves for any quick fenfations. However, various means have been thought of for mitigating the agony of death. Lord Bacon confiders this as part of the province of a phyfician; and that not only when fuch a mitigation may tend to a recovery, but alfo when, there being no further hopes of a recovery, it can only tend to make the paffage out of life more calm and eafy. Complacency in death, which Auguftus fo much defired, is certainly no fmall part of happinefs. Accordingly the author laft cited ranks *embafia*, or the art of dying eafy, among the defiderata of fciences; and does not even feem to difapprove of the courfe Epicurus took for that end,

—*Hinc fignis ebrius haufti equas.*

Opium has been applied for this purpofe, with the applaufe of fome, but the condemnation of more.

AGOSTA, a town of Sicily, with an excellent harbour. The greateft part of it was fwallowed up by an earthquake in 1693. Long. 15. 15. E. Lat. 37. 35. N.

AGRA (*Encycl.*). This is looked upon as the largeft city in the province, and is in the form of a half-moon. A man on horfeback can hardly ride round it in a day. It is furrounded with a wall of red ftone, and with a ditch 100 feet wide. The Great Mogul, of whole dominions it is a part,

Sometimes resides here: his palace is prodigiously large, and the seraglio commonly contains above 1000 women. There are upwards of 800 baths in this town; but that which travellers most admire, is the mausoleum of one of the Mogul's wives, which was 20 years in building. The indigo of Agra is the most valuable of all that comes from the East Indies. It is seated on the river Jemna, about 50 miles above its confluence with the Tehemel, and is 300 miles N. E. of Surat. E. long. 79. 12. N. lat. 26. 29.

AGREEMENT, in law, signifies the consent of several persons to any thing done or to be done. It also denotes a kind of writing or legal instrument by which the subscribing parties are bound to the performance of some specific act or covenant, on certain terms and conditions therein specified. Written agreements are not valid unless legally stamped within a limited time.

AGRESTÆ, among physicians, denotes unripe grapes, said to be of a cooling nature.

AGRI, or **AGRI**, a river of the kingdom of Naples, which arising in the Apennine mountains, not far from Marisco Nuovo, falls into the gulph of Tarento.

AGRICOLA (Cneus Junius), born at Frejus in Provence, was made lieutenant in Vespasian's time, to Vettius Bolanus in Britain; and, upon his return, was ranked by that emperor among the patricians, and made governor of Aquitania. This post he held three years; and upon his return was chosen consul, and afterward appointed governor of Britain, where he greatly distinguished himself. He reformed many abuses occasioned by the avarice or negligence of former governors; put a stop to extortion; and caused justice to be impartially administered. Vespasian dying about this time, his son Titus, knowing the great merit of Agricola, continued him in the government. In the spring, he marched towards the north, where he made some new conquests, and ordered forts to be built for the Romans to winter in. He spent the following winter in concerting schemes to bring the Britons to conform to the Roman customs: he thought the best way of diverting them from rising and taking arms, was to soften their rough manners, by proposing to them new kinds of pleasure, and inspiring them with a desire of imitating the Roman manners. Soon after this, the country was adorned with magnificent temples, porticos, baths, and many other fine buildings. The British nobles had at length their sons educated in learning; and they who before had the utmost aversion to the Roman language, now began to study it with great assiduity: they were likewise the Roman habit; and, as Tacitus observes, they were brought to consider those things as marks of politeness, which were only to many badges of slavery. Agricola, in his third campaign, advanced to far as the Tweed; and in his fourth, he subdued the nations betwixt the Tweed and the friths of Edinburgh and Dunbritton, into which the rivers Glotta and Bodotria discharge themselves; and here he built fortresses to shut up the nations yet unconquered. In his fifth, he marched beyond the friths; where he made some new acquisitions, and fixed garrisons along the western coasts, over against Ireland. In his sixth campaign he passed the river Bodotria, ordering his fleet, the first which the Romans ever had in those parts, to row along the coasts, and take a view of the northern parts. In the following spring, the Britons raised an army of 30,000 men; and the command was given to Galgacus, who, according to Tacitus, made an excellent speech to his countrymen on this occasion. Agricola likewise addressed his men in very strong and eloquent terms. The Romans gained the victory, and 10,000 of the Britons are said to have been killed. This happened in the reign of the emperor Domitian; who, growing jealous of the glory of Agricola, recalled him, under pre-

tence of making him governor of Syria. Agricola died soon after, and his death is suspected to have been occasioned by poison given to him by that emperor. Tacitus the historian married his daughter, wrote his life, and laments his death in the most pathetic manner.

AGRICOLA (George), a German physician, famous for his skill in metals. He was born at Glaucha in Misnia, the 24th of March, 1494. The discoveries which he made in the mountains of Bohemia gave him so great a desire of examining accurately into every thing relating to metals, that though he had engaged in the practice of physic at Joachimsthal by advice of his friends, he still prosecuted his study of fossils with great assiduity; and at length removed to Chemnitz, where he entirely devoted himself to this study. He spent in pursuit of it the pension he had of Maurice duke of Saxony, and part of his own estate; so that he reaped more reputation than profit from his labours. He wrote several pieces upon this and other subjects; and died at Chemnitz the 21st of November, 1555, a very firm Papist. In his younger years he seemed not averse to the Protestant doctrine; and he highly disapproved of the scandalous traffic of indulgences, and several other things in the church of Rome. In the latter part of his life, however, he attacked the Protestant religion; which rendered him so odious to the Lutherans, that they suffered his body to remain unburied for five days together; so that it was obliged to be removed from Chemnitz to Zeitz, where it was interred in the principal church.

AGRICOLA (John), a Saxon divine born at Ilsebe in 1492. He went as chaplain to Count Mansfeld, when that nobleman attended the Elector of Saxony to the diet of Spire in 1526, and that of Aulburgh in 1530. He was of a restless ambitious temper, rivalled and wrote against Melancthon, and gave Count Mansfeld occasion to reproach him severely. He obtained a professorship at Wittenberg, where he taught particular doctrines, and became founder of the sect of Antinomians; which occasioned warm disputes between him and Luther, who had before been his very good friend. But though he was never able to recover the favour either of the Elector of Saxony, or of Luther, he received some consolation from the fame he acquired at Berlin; where he became preacher at court; and was chosen in 1548, in conjunction with Julius Plug, and Michael Heldingus, to compose the famous *Interim*, which made so much noise in the world. He died at Berlin in 1566.

AGRIMONOIDES, the trivial name of a species of the agrimonia.

AGRIGNAN, one of the islands of the Ladrões, about 40 miles in compass. Long. 146. 0. E. Lat. 19. 40. N.

AGRIPPA (Herod), son of Aristobulus, by Berenice, and the grandson of Herod the Great. He was cast into prison by Tiberius for wishing Caius emperor, who gave him a chain of gold equal in weight to those which he had worn in prison, and afterwards made him king of Judea. He put St. James to death, imprisoned St. Peter, and, for allowing the deifying shouts of the people, was eaten up with worms.

AGRIPPA II. son of the preceding Herod, was made king of Chalcide; but three or four years after, he was deprived of that kingdom by Claudius, who gave him in the place of it other provinces. In the war Vespasian carried on against the Jews, Herod sent him a succour of 2000 men; by which it appears, that, though a Jew by religion, he was yet entirely devoted to the Romans, whose assistance indeed he wanted, to secure the peace of his own kingdom. He lived to the third year of Trajan, and died at Rome A. C. 100. He was the seventh and last king of the family of Herod the Great. It was before him and Berenice his sister, that St. Paul pleaded his cause at Cæsarea.

AGRIPIA (Marcus Vipsanius), son-in-law to Augustus, of mean birth, but one of the most considerable generals among the Romans. Augustus's victory over Pompey and Mark Anthony was owing to his counsel: he adorned the city with the pantheon, baths, aqueducts, &c.

AGRIPIA (Cornelius), born at Cologne in 1486, a man of considerable learning, and, by common report, a great magician; for the monks at that time suspected every thing of heresy or sorcery which they did not understand. He composed his *Treatise of the Excellence of Women*, to infaminate himself into the favour of Margaret of Austria, governess of the Low-countries. He accepted of the charge of historiographer to the emperor, which that prince gave him. The treatise of the *Vanity of the Sciences*, which he published in 1530, enraged his enemies extremely; as did that of *Occult Philosophy*, which he printed soon after at Antwerp. He was imprisoned in France for something he had written against Francis I.'s mother; but was enlarged, and went to Grenoble, where he died in 1534. His works are printed in two volumes octavo.

AGRIPIINA, daughter of Germanicus, sister of Caligula, and mother of Nero; a woman of wit, but excessively lewd: she was thrice married; the last time to Claudius, her own uncle, whom she poisoned to make way for Nero, her son. Nero afterward caused her to be murdered in her chamber, when she bid the executioner stab her first in the belly, that had brought forth such a monster.

AGRIPIINA COLONIA UBIORUM (Pliny, Suetonius), now *Cologne*: so called from Agrippina, the daughter of Germanicus, and mother of Nero, who had a colony sent thither at her request by the Emperor Claudius, to honour the place of her birth. See *COLOGNE*.

AGUA DE PAO, a town in the island of St. Michael, one of the Azores. Long. 25. 40. W. Lat. 38. 0. N.

AGUAS BELLAS, a town of Portugal, in Estramadura. Long. 8. 5. W. Lat. 39. 40. N.

AGUE (*Encycl.*). That article should have referred to Intermittent Fever, under *MEDICINE*.

AGUILA, a town of the kingdom of Fez, in Africa, seated on the river Aguilu.

AGUILONIUS (Francis), a Jesuit, born at Brussels: he was rector of the Jesuits' college at Antwerp, and eminent for his skill in mathematics. He was the first who introduced that science among the Jesuits in the Low-countries: he wrote a book of Optics, and was employed in finishing his Catoptrics and Dioptrics, when death prevented him in 1617.

AGUIRRA (Joseph Sienz de), a Benedictine, and one of the most learned men of the 17th century, was born March 24, 1630. He was censor and secretary of the supreme council of the Inquisition in Spain, and interpreter of the scriptures in the university of Salamanca. He printed three volumes in folio upon Philosophy, a Commentary upon Aristotle's ten books of Ethics, and other pieces. He died at Rome, August 19, 1699.

AGURANDE, a small town of France, in the department of Indre, and late province of Berry. Long. 2. 10. E. Lat. 47. 20. N.

AGURIUM, or **AGYRIUM** (anc. geog.), a town of Sicily in the Val di Demona, near the river Senetus. The people were called *Populus Agrimenfis*, by Cicero; *Agrinus*, by Pliny. It was the birth-place of Diodorus Siculus, as he himself testifies; but he calls it *Argyrium*, as it is now called *S. Philippo d'Argirone*, which modern name seems to confirm that *Argyrium* is the true reading.

AHAB, son of Omri king of Israel, succeeded his father, A.M. 3686, and surpassed all his predecessors in impiety and wickedness.

AHALOTH. See *XYLO-ALOES*.

AI (anc. geog.), a town in Judea, to the north of Jericho, called *Aias* by Josephus, and the inhabitants *Ainates*.

AICH, a town of Bavaria, on the Par. It was taken by the Swedes in 1634, and afterward reduced to ashes. Long. 11. 20. E. Lat. 48. 30. N.

AIALON (anc. geog.), a town of the tribe of Dan, one of the Levitical. Another in the tribe of Benjamin, in whose valley Joshua commanded the moon to stand still, being then in her decrease, and consequently to be seen at the same time with the sun.

AJAX, the son of Oileus, was one of the principal generals that went to the siege of Troy: he ravished Cassandra, the daughter of Priam, even in the temple of Minerva, where he thought to have found sanctuary. It is said he made a serpent, of fifteen feet long, so familiar with him, that it ate at his table, and followed him like a dog. The Locrians had a singular veneration for his memory.

AJAX, the son of Telamon, was, next to Achilles, the most valiant general among the Greeks at the siege of Troy: he commanded the troops of Salamis, and performed many great actions, of which we have an account in the *Iliad*, in *Ditty Cretensis*, and in the 23d book of Ovid's *Metamorphoses*. He was so enraged, that the arms of Achilles were adjudged to Ulysses, that he immediately became mad. The Greeks paid great honours to him after his death, and erected a magnificent monument to his memory upon the promontory of Rheum.

AICHSTAT (*Encycl.*). This town is remarkable for a curious piece of workmanship, called the Sun of the Holy Sacrament, which is in the church: it is of massy gold, of great weight, and is enriched with 350 diamonds, 1400 pearls, 250 rubies, and other precious stones. This place is moderately large, and seated in a valley on the river Altmul, 10 miles N. of Newburgh, and 37 S. of Neuremberg. The bishopric is 45 miles in length, and 17 in breadth; and the bishop is chancellor of the church of Mayence or Mentz.

AIDAN, a famous Scottish bishop of Lindisfarne, or Holy Island, in the 7th century, was employed by Oswald king of Northumberland in the conversion of the English, in which he was very successful. He died in 651.

AIELLO, a small town in Abruzzo Ulteriore, in the kingdom of Naples, belonging to the hereditary prince of Modena. Long. 15. 20. E. Lat. 41. 40. N.

AIGLE (*Encycl.*). Through the Aigle and Bex lies the great road from Valais into Italy. When you pass by Ville-neuve, which is at the head of the lake of Geneva, you enter into a deep valley three miles wide, bordered on one side with the Alps of Switzerland, and on the other with those of Savoy, and crossed by the river Rhone. Six miles from thence you meet with Aigle, a large town, seated in a wide part of the valley, where there are vineyards, fields, and meadows. The governor's castle is on an eminence that overlooks the town, and has a lofty marble tower. This government has nine large parishes; and is divided into four parts, Aigle, Bex, Olon, and Ormont. This last is among the mountains, and joins to Rougemont. It is a double valley, abounding in pasture-lands. Ivorna, in the district of Aigle, was in part buried by the fall of a mountain, occasioned by an earthquake in 1884.

AIGLE (*Encycl.*), a small town in France, in the department of Orne. It is 23 miles from D'Evereux, and 38 from Rouen. It is surrounded with walls and ditches, has six gates, three suburbs, and three parishes. It trades in corn, toys, and more particularly in needles and pins. E. long. 1. 5. N. lat. 48. 35.

AIGNAN, St. a small town of France, in the department of Loire and Cher, and late province of Blaisois. It is in the form of an amphitheatre, at the foot of which runs the Cher, at the distance of 60 miles from Bourges.

AIGUE-PERSE, a small town of France, in the department of Puy-de-Dome, and late province of Auvergne. It is 18 miles N. of Clermont, and 261 S. of Paris. It has a fountain, once regarded as a prodigy, its cold water having the appearance of boiling. But the chemists can now imitate these cold fermentations by a mixture of ferruginous and vitriolic particles. The water of this spring is said to be fatal to the animals that drink it. Long. 3. 20. E. Lat. 46. 6. N.

AILAH, a small ancient town of Arabia Petraea, on the E. side of the Red Sea, near the road which the pilgrims take from Egypt to Mecca. Long. 36. 40. E. Lat. 29. 10. N.

AILANA, **AILATH**, or **AHELOTH**, anciently a town of Arabia Petraea, situated near the Sinus Elanites of the Red Sea. It was also called *Elath*, and *Eloth* (Stephanus, Strabo, Moses). The same with *Elana*.

AILRED, or **EALRED**, abbot of Revesby in Lincolnshire, in the reigns of Stephen and Henry II. He was born in 1109, of a noble family, and educated in Scotland with Henry the son of King David. On his return to England, he became a monk of the Cistercian order, in the monastery of Revesby, of which he afterwards was made abbot. He died on the 12th of January, 1166, aged 57, and was buried in his monastery. "He was (says Leland) in great esteem during his life; celebrated for the miracles wrought after his death; and admitted into the catalogue of saints." He was author of several works; most of which were published by Gilbo the Jesuit, at Douay, 1631; part of them may be also found in the *Bibliotheca Cisterciensis*, and *Bibliotheca Patrum*. His principal work is the *Speculum charitatis*. Leland, Bale, and Pits, mention several manuscripts which never were published.

AILSA, a great insulated rock, to the south of the isle of Arran, in Scotland. Its base is about two miles in circumference. It consists of a stupendous assemblage of precipitous cliffs, rising in a wild series, forming a pyramidal mountain, 900 feet high, accessible only on the north-east. The ruins of a chapel, and of a castle, are still seen; and within 30 yards of the latter, is a spring of fresh water. The lower parts are inhabited by goats and rabbits; and the lofty summits are the refuge of innumerable sea-fowl.

AIME, or **AXIMA**, a small town in Savoy, on the river Isere.

AIN, a department of France, lately the province of Bresse. It takes its name from a river which rises at the foot of Mount Jura, and falls into the Rhone above Lyons.

AINSA, a town of Spain, in Arragon, on the river Ara.

AINSWORTH (Dr. Henry), an eminent nonconformist divine, who, about the year 1590, distinguished himself among the Brownists; which drew upon him such troubles, that he was obliged to retire to Holland, and became minister of a church at Amsterdam. His skill in the Hebrew language, and his excellent Annotations on the Holy Scriptures, which are still highly esteemed, gained him great reputation. He also wrote several pieces in defence of the Brownists, and several other works.

AINSWORTH (Robert), born at Woodyale in Lancashire, in 1660, was master of a boarding-school at Bethnal-green, from whence he removed to Hackney, and to other places in the neighbourhood of London. After acquiring a moderate fortune, he retired, and lived privately till the time of his death, which happened in 1743. We are indebted to him for the best Latin and English Dictionary extant: he published it in quarto, 1736; and in 1752, the fourth edition, under the care of Doctor Ward, of Graham College, and the Rev. William Young, was enlarged to two volumes folio.

AIRANI (*Encycl.*). This sect are otherwise called *Airanike*; and are said to have taken their name from one *Airas*, who distinguished himself at the head of this party, in the reigns of Valentinian and Gratian.

AIRAY (Henry), provost of Queen's College in Oxford, was born in Westmoreland, in the year 1560, educated in grammatical learning by the care of Bernard Gilpin, usually called the Northern Apostle, and by him sent to St. Edmund's Hall, in Oxford, in the year 1579. Mr. Airay soon removed from St. Edmund's Hall to Queen's College, where he became a solicitor. In 1583 he took his bachelor's degree, and in 1586 he commenced master of arts and fellow. About this time he went into orders, and became a constant and zealous preacher in the university, particularly in the church of St. Peter in the East, adjoining to Queen's College. In 1594 he took the degree of bachelor in divinity, and four years after was chosen provost of his college. In 1600 he proceeded in divinity, and six years after was chosen vice-chancellor. He wrote the following pieces, which were published after his death. 1. Lectures upon the whole Epistle of St. Paul to the Philippians. London, 1618, 4to. 2. The just and necessary Apology touching his Suit in Law, for the Rectory of Charlton on Otmore, in Oxfordshire. London, 1621, 8vo. 3. A Treatise against bowing at the Name of Jesus. Airay was a zealous Calvinist, and a great supporter of those of his party; who concur in giving him the character of a person of great holiness, integrity, learning, gravity, and indefatigable pains in the discharge of his ministerial function. He died in Queen's College the 10th of October, 1616, aged 57.

AIRAY (Christopher), vicar of Milford in Hampshire, was born at Clifton in Westmoreland, and admitted a student in Queen's College, in Oxford, in Michaelmas term, 1621; where, having passed through the servile offices, and taken the degree of master of arts, he was elected a fellow. Soon after, agreeably to the statutes of that house, he went into holy orders, and, in 1642, took the degree of bachelor of divinity. He wrote a Collection of the Rules of Logic, for the use of the students in the university.

AIRE, in geography, a sea-port town in Scotland, situated in N. lat. 55. 30. and W. long. 4. 40. at the mouth of a river of the same name, which discharges itself into the frith of Clyde. Aire is the chief town of the county, and very ancient. About a mile north from the town, there is a lazar-house, commonly called *the King's chapel*, which King Robert de Bruce let apart for the maintenance of lepers.

AIRESHIRE, a county of Scotland, the capital of which is the town of Aire. It lies eastward of the frith of Clyde.

AISNE, a department of France, including the late provinces of Soissonnois and Vermandois. It takes its name from a river, which runs by Soissons, and falls into the Oise, near Compiègne.

AIUS LOCUTIUS, the name of a deity to whom the Romans erected an altar.—The words are Latin, and signify "a speaking voice."—The following accident gave occasion to the Romans erecting an altar to the Aius Locutius. One M. Ceditius, a plebeian, acquainted the tribunes, that, in walking the streets by night, he had heard a voice over the temple of Vesta, giving the Romans notice that the Gauls were coming against them. This intimation was however neglected; but after the truth was confirmed by the event, Camillus acknowledged this voice to be a new deity, and erected an altar to it under the name of the *Aius Locutius*.

AIX (*Encycl.*), is now the metropolitan see of the department of the mouth of the Rhone. It is a well-built city; and most like Paris of any place in the kingdom, as well for the largeness of the buildings, as in respect of the politeness of the inhabitants. It is embellished with abundance of fine fountains, and several beautiful squares. The Preacher's square is on the side of a hill; it is about 160 yards in length, and is surrounded with trees, and houses, built with stone, three stories high. The town-hall is at one end of the city, and is dis-

tributed into several fine apartments: the two lowest are taken up by the board of accounts, and by the seneschal; that above was formerly designed for the sessions of parliament. The hotel of the city is a handsome building, but hid by the houses of the narrow street in which it is placed. The cathedral church is a Gothic structure. The church of the fathers of the Oratory is a handsome building; and not far from thence is the chapel of the Blue Penitents, which is full of paintings. The convent of Preachers is very fine; in their church was a silver statue of the Virgin Mary almost as big as the life, which, no doubt, the revolutionists have disposed of in another manner. There are other churches and buildings which, during the monarchy, contained a great number of rarities. The baths without the city have good buildings, raised at a vast expence, for the accommodation of those that drink the waters. E. Long. 5. 32. N. lat. 43. 32.

AKENSIDE (Dr. Mark), a celebrated physician and poet, born at Newsoffe upon Tyne in 1721; where, and at the universities of Edinburgh and Leyden, he was educated. He was afterward admitted by mandamus to the degree of doctor in physic at Cambridge; and was appointed one of the queen's physicians, upon the establishment of her household. He was possessed of a fine luxuriant fancy; which, though he wrote many pieces, particularly odes, is principally displayed in that admired poem, *The Pleasures of Imagination*; which, however, he did not live to finish according to his plan. He died of a putrid fever in 1770.

AKIBA, a famous rabbin, flourished a little after the destruction of Jerusalem by Titus. He kept the flocks of a rich citizen of Jerusalem till the 40th year of his age, and then applied himself to study in the academies for 24 years; and was afterwards one of the greatest masters in Israel, he having 24,000 scholars. He declared for the impostor Barcochebas, whom he owned for the Messiah; and not only anointed him king, but took upon himself the office of his master of the horse. The troops which the Emperor Hadrian sent against the Jews, who, under the conduct of this false Messiah, had committed horrid massacres, exterminated this faction. Akiba was taken, and put to death with great cruelty. He lived 120 years; and was buried with his wife in a cave upon a mountain not far from Tiberias, and his 24,000 scholars were buried round about him upon the same mountain. It is imagined he invented a supposititious work under the name of the patriarch Abraham.

ALADULIA (*Encyc.*), is situated in that part of Turkey called Natolia, between the mountains of Antitaurus, which separate it from Asia on the north, and from Carmania on the west. It has the Mediterranean sea on the south; and the Euphrates, or Frat, on the east, which divides it from Diarbeker. It comprehends the Lesser Armenia of the ancients, and the east part of Cilicia. Formerly it had kings of its own; but the head of the last king was cut off by Selim I. emperor of the Turks, who had conquered the country. It is now divided into two parts: the north, comprehended between Taurus, Antitaurus, and the Euphrates, is a beglerbeglic, which bears the name of Marash, the capital town; and the south, seated between mount Taurus and the Mediterranean, is united to the beglerbeglic of Aleppo. The country is rough, rugged, and mountainous; yet there are good pastures, and plenty of horses and camels. The people are hardy and thievish. The capital is Malatigha.

ALAGOA, a town in the isle of St. Michael, one of the Azores.

ALAIN (Chartier), secretary to Charles VII. king of France, born in the year 1386. He was the author of several works in prose and verse; but his most famous performance was his *Chronicle of King Charles VII.* Bernard de Girard,

in his preface to the History of France, styles him "an excellent historian, who has given an account of all the affairs, particulars, ceremonies, speeches, answers, and circumstances, at which he was present himself, or had information of." Giles Coroxet tells us, that Margaret, daughter to the King of Scotland, and wife to the dauphin, passing once through a hall where Alain lay asleep, he stopped and kissed him before all the company who attended: some of them telling her, that it was strange he should kiss a man who had so few charms in his person, she replied, "I did not kiss the man, but the mouth from whence proceed so many excellent sayings, so many wise discourses, and so many elegant expressions." Mr. Fontenelle, among his *Dialogues of the Dead*, has one upon this incident, between the Princess Margaret and Plato. Mr. Pasquier compares Alain to Seneca, on account of the great number of beautiful sentences interperfed throughout his writings.

ALAIS, a town of France, is situated in the department of Gard, and late province of Languedoc, on the river Gardon, at the foot of the Cevennes. The Jesuits had a college in this place; and a fort was built here in 1689.

ALALCOMENIUS, in Grecian antiquity, the Boeotian name of the month, called, by the Athenians, *Metacterion*.

ALAMANNI (Lewis), was born at Florence, of a noble family, on the 28th of October, 1495. He was obliged to fly his country for a conspiracy against Julius de Medici, who was soon after chosen pope under the name of Clement VII. During this voluntary banishment, he went into France; where Francis I. from a love to his genius and merit, became his patron. This prince employed him in several important affairs, and honoured him with the collar of the order of St. Michael. About the year 1540, he was admitted a member of the *Inflammati*, an academy newly erected at Padua, chiefly by Daniel Barbaro and Ugolin Martelli. After the death of Francis, Henry duke of Orleans, who succeeded him in 1537, shewed no less favour to Alamanni; and in the year 1551 sent him as his ambassador to Genoa: this was his last journey to Italy; and being returned to France, he died at Amboise on the 16th of April, 1556, being in the 61st year of his age. He left many beautiful poems, and other valuable performances, in the Italian language. We have also some notes of his upon Homer's *Iliad* and *Odyssey*; those upon the *Iliad* were printed in the Cambridge edition of Homer in 1689, and Joshua Barnes has also inserted them in his fine edition of Homer, in 1711.

ALAMOS (Balthazar), a Spanish writer, born at Medina del Campo in Castile. After having studied the law at Salamanca, he entered into the service of Anthony Perez, secretary of state under Philip II. He was in high esteem and confidence with his master, upon which account he was imprisoned after the disgrace of this minister; he was kept in confinement eleven years, when Philip III. coming to the throne, set him at liberty, according to the orders given by his father in his will. Alamos continued in a private capacity, till the Duke of Olivarez, the favourite of Philip IV. called him to public employments. He was appointed advocate-general in the court of criminal causes, and in the council of war. He was afterwards chosen counsellor of the council of the Indies, and then of the council of the king's patrimony, and a knight of the order of St. James. He was a man of wit as well as judgment, but his pen was superior to his tongue. He died in the eighty-eighth year of his age. His Spanish translation of Tacitus, and the aphorisms which he added in the margin, gained him great reputation: the aphorisms, however, have been censured by some authors, particularly by Mr. Amelot, who says, "that they are quite different from what one would expect; that instead of being more concise and sententious than the text, the words of the text are always more so than the aphorism."

This work was published at Madrid in 1614, and was to have been followed, as mentioned in the king's privilege, with a Commentary, which, however, has never yet appeared. The author composed the whole during his imprisonment. He left several other works, but they were never printed.

ALAN (Cardinal William), was born at Ross in Lancashire, in the year 1532. He went to Oxford at the age of fifteen, and in 1550 was elected fellow of Oriel College. In 1556, being then only twenty-four years old, he was chosen principal of St. Mary's Hall, and one of the proctors of the university. In 1558 he was made canon of York; but, upon Queen Elizabeth's accession to the throne, he left England, and settled at Louvain in an English college, of which he became the chief support. In 1565 he visited his native country; but, on account of his extreme activity in the propagation of the Roman-catholic religion, he was obliged to fly the kingdom in 1568. He went first to Mechlin, and then to Douay, where he was made doctor of divinity. Soon after he was appointed canon of Cambrai, and then canon of Rheims. He was created cardinal on the 28th of July, 1587, by the title of *St. Martin in Montibus*; and obtained from the King of Spain a rich abbey in the kingdom of Naples, and afterwards the bishopric of Mechlin. It is supposed to have been by the advice and instigation of this priest, that Philip II. attempted to invade England. He died on the 20th of October, 1594, aged sixty-three; and was buried in the English college at Rome. He was a man of considerable learning, and an elegant writer. He wrote many books in defence of the Romish religion. The most remarkable are, 1. *A Defence of the Twelve Martyrs in one Year*. Tho. Alford was hanged for bringing, and publishing, this and other of Alan's works, into England, in the year 1584. 2. *A Declaration of the Sentence of Sixtus V. &c.* A work intended to explain the Pope's bull for the excommunication of Queen Elizabeth, and to exhort the people of England to take up arms in favour of the Spaniards. Many thousand copies of this book, printed at Antwerp, were put on board the Armada; but the enterprise failing, they were afterwards destroyed. 3. *Of the Worship due to Saints and their Relics*, 1583. This treatise was answered by Lord Burleigh, and is esteemed the most elegant of the cardinal's writings.

ALAN (of Lynn), a famous divine in the 15th century, was born at Lynn, in the county of Norfolk, and educated in the university of Cambridge; where he applied himself diligently to the study of philosophy and divinity, and, having taken the degree of doctor, became an eminent preacher. Bale, who gives Alan an advantageous character, yet blames him for using allegorical and moral expositions of scripture. But he is particularly famous for the great pains he took in making indexes to most of the books he read. Alan flourished about the year 1420, and wrote several pieces, particularly, 1. *Of the different Senses of Scripture*. 2. *The Morality of the Scriptures*. 3. *Remarkable Discourses*. 4. *A Method of interpreting Scripture*. 5. *Lectures on Divinity*. 6. *Explications of Aristotle*. At length he became a Carmelite, in the town of his nativity, and was buried in the convent of his order.

ALAND, Sir John Fortescue, LL. D. R. S. S. baron of the Exchequer, puisne judge of both benches to King George the First, and a peer of England in the subsequent reign; was born 7th March, 1670; second son to Edmund Fortescue, of London, esq.

This judge was descended from Sir John Fortescue, lord chief-justice, and lord high-chancellor of England, under King Henry the Sixth. Sir John Fortescue Aland added his latter name of Aland in compliment to his lady, who was the eldest daughter to Henry Aland, esq. of Waterford in Ireland.

Sir John Fortescue Aland, when at Oxford, greatly improved his natural endowments, and deservedly had the reputation of being a general soldier; and as he was intended for the profession of the law, upon leaving the university, he became a member of the Inner Temple, where he was chosen reader in the year 1716, as appears by a subscription to his arms ("azure, a bend engrailed argent, cottices or;" crest "a plain shield argent;" supporters "two greyhounds argent, collar and lined gules;" motto "*Fortē scutum salus ducum*"); they are in the parliament chamber of that society, and in Guillim's Heraldry; in allusion to the connection between the family name "Fortescue," and the first two words of the motto "*Fortē scutum*." Sir Walter Raleigh hath styled our judge's ancestor, the *bulwark* of the law. He was called to the bar about the happy æra of the glorious Revolution; in which situation he shone with meridian lustre.

In the year 1714, our barrister was appointed solicitor-general to his Royal Highness the Prince of Wales, afterwards King George the Second, and in 1716 was constituted solicitor-general to the king, in the room of Nicholas Lechmere, resigned; which arduous and important office he executed so much to the satisfaction of his majesty, that he was soon promoted to be one of the barons of the Exchequer; and on 15th May, 1718, was constituted one of the justices of the court of King's Bench, in the place of Sir John Pratt. After the accession of his late majesty King George the Second, all the judges had new patents, except Mr. Justice Fortescue Aland, whose commission was superseized; and the reason generally assigned was, his opinion on the following grand question, viz. "Whether the education and care of his majesty's (King George the First) grand-children, in England, and of Prince Frederic (late father to King George the Third), eldest son of his Royal Highness the Prince of Wales (late grand-father to King George the Third), when his majesty should think fit to cause him to come into England, and the ordering the places of abode, and appointing their governors, and governesses, and other instructors, and attendants, and servants, and the care and approbation of their marriages, when grown up, belonged of right to his majesty, as king of the realm or not?"

Ten judges, among whom was Sir John Fortescue Aland, were of opinion that their education and the approbation of their marriages did belong to his majesty. But we very much doubt the authenticity of the said general assertion of the cause for removing Sir John Fortescue Aland, because a king of the disposition of George the Second would, on the contrary, reverse a judge of such Roman fortitude, and blessed with all the cardinal virtues of his office, courage, integrity, and abilities; and who gave so convincing a proof of his being possessed of every qualification requisite for forming the complete character of a judge. But be our arguments well founded or not, and whether his late majesty did act from the unjust motive above suggested, he soon satisfied mankind and the judge, that all resentment had subsided, and that he was resolved to pay to our judge the tribute due to his merit; for, upon the death of Spencer Cowper (which happened the very next year after Sir John Fortescue Aland's removal), his majesty was pleased to constitute him one of the justices of his court of Common Pleas, viz. 27th January, 1728, Hilary Term, 2 George II.; and what is rather a singular circumstance, he succeeded Spencer Cowper, who succeeded our judge, on being superseized in manner and for the cause above mentioned.

Sir John Fortescue Aland continued on the bench of the court of Common Pleas, from Michaelmas vacation, 2 George II. 1728, until Trinity Term, 19 and 20, A. D. 1746, when he resigned the same, having sat in the superior courts of Westminster for the long period of thirty years, and eighteen of them in the court alluded to. In honour to the judicial inte-

grity and abilities of Sir John, his majesty was pleased to create him a peer of Ireland, by the style and title of John Lord Fortescue Aland, baron Fortescue of Credan, in the kingdom of Ireland, by privy seal, dated at Kennington, 26th June, 1746, 19 George II. and by patent dated at Dublin, 15th August, same year.

Sir John left behind him the following juridical writings: 1. The Difference between an Absolute and Limited Monarchy, as it more particularly regards the English Constitution. 2. Reports of select Cases in all the Courts of Westminster Hall, *tempore* William the Third and Queen Anne; also the Opinion of all the Judges of England, relating to the greatest Prerogatives of a Queen Consort.

ALANORARIUS, in our old customs, was a keeper of spaniels, setting-dogs, &c. for the use of sportsmen. The word is derived from *alan*, a gothic term for a greyhound.

ALAUQUECA, a stone brought from the East Indies in small glossy fragments, said to stop hemorrhages by external application.

ALARAF (*Encycl.*), gives the denomination to the seventh chapter of the Alcoran, wherein mention is made of this wall. Mahomet seems to have copied his *al araf*, either from the great Gulf of separation mentioned in the New Testament, or from the Jewish writers, who also speak of a thin wall dividing heaven from hell. Mahometan writers differ extremely as to the persons who are to be found on *al araf*. Some take it for a sort of limbus for the patriarchs, prophets, &c. others place here such whose good and evil works so exactly balance each other, that they deserve neither reward nor punishment. Others imagine this intermediate space to be possessed by those who, going to war without their parents' leave, and suffering martyrdom there, are excluded paradise for their disobedience, yet escape hell because they are martyrs.

ALASCANI (*Encycl.*), a sect of Antilutherans, are said to have taken the name from one Joannes a Lascio, a Polish baron, superintendent of the church of that country, in England. See the next article.

ALASCO (John), a Polish nobleman of the 16th century, who, imbibing the reformed opinions, was expelled his country, and became preacher to a Protestant congregation at Embden; but foreseeing persecution there, came to England about the year 1551, while the reformation was carrying on under Edward the Sixth. The publication of the Interim driving the Protestants to such places as afforded them toleration, 380 were naturalized here, and obtained a charter of incorporation, by which they were erected into an ecclesiastical establishment, independent on the church of England. The Augustine friars' church was granted them, with the revenues, for the maintenance of Alasco as superintendent, with four assistant ministers, who were to be approved by the king; and this congregation lived undisturbed until the accession of Queen Mary, when they were all sent away. They were kindly received, and permitted to settle at Embden; and Alasco at last, after an absence of twenty years, by the favour of Sigismund returned to his own country, where he died in 1560. Alasco was much esteemed by Erasmus, and the historians of his time speak freely in his praise: we have of his writing *De Cæna Domini liber; Epistola continens summam Controversiæ de Cæna Domini*, &c. He had some particular tenets; and his followers are called *Alascani* in church history. See the preceding article.

ALATED ANIMALS, such as are furnished with wings.

ALATED Leaves, in botany, such as are composed of several pinnated ones. See PINNATED.

ALATERNOIDES, in botany, a synonyme of a species of the myrica. See MYRICA.

ALATRI, a town in the Campagna of Rome, on a hill, with

a bishop's see; 40 miles S.E. of Rome. Long. 13. 8. E. Lat. 41. 30. N.

ALATYR, a town of Russia, in Asia, on the river Suru, in the government of Kasan, and 40 miles E. of Kasan.

ALBA, a town of Italy, in Montserrat, with a bishop's see. It was ceded in 1631 to the Duke of Savoy, and is seated on the river Tanaro, 20 miles S.E. of Turin. Long. 8. 5. E. Lat. 44. 46. N.

ALBA (anc. geog.), a town of the Marsi in Italy, situated on the north side of the Lacus Fucinus, still retaining its name. The inhabitants were called *Albani*, and *Albanenses*.

ALBA HELVIORUM, or *Albaugusta*, in ancient geography (Pliny, Ptolemy); afterwards called *Vicarianus*, now *Viviers*, in the fourth-east of Languedoc, on the Rhone. In the lower age the inhabitants were called *Albanenses*, and their city, *Civitas Albensum*, in the Notitia Galliarum. E. long. 4. 45. Lat. 44. 50.

ALBA JULIA (anc. geog.), now *Weissenburg* a town of Transylvania, on the river Marisus, or Merisch, to the west of Hermanstadt, supposed to be called *Alba Julia*, after Julia Domna, the mother of Caracalla. There are, however, several inscriptions found at or near Weissenburg, which bear *COL. APUL.* that is *Colonia Apulensis*, without the least mention of *Alba Julia*, though inscribed after Caracalla's time. Add, that Ulpian, reciting the colonies of Dacia, calls this colony *Apulensis*, and neither *Alba* nor *Julia*. Whence there is a suspicion, that *Alba Julia* is a corruption of *Apulum*. It was also called *Apulum Augustum*. E. long. 25. 0. Lat. 46. 46.

ALBA LONGA (anc. geog.), a colony from Lavinium, in Latium, established by Alcanius, the son of Æneas, at the foot of the Mons Albanus: called *Alba*, from a white sow found by Æneas, which farrowed 30 white pigs on that spot; which circumstance was interpreted to portend the building of a city there in 30 years after (Propertius). The epithet *Longa* was added on account of its length. It was the royal residence, till the building of Rome, as was foretold by Anchises (Virgil); was destroyed by Tullus Hostilius, all but the fane or temple; and the inhabitants were transplanted to Rome (Strabo).

ALBA POMPEIA (anc. geog.), on the river Ceba, now *Ceva*, in Liguria, the birth-place of the Emperor Pertinax; a colony either established at first by Pompey, or re-established by him after having been before settled by Scipio. The inhabitants were called *Albanenses Pompeiani*. At this day the town is simply called *Alba*, without any epithet.

ALBANA (anc. geog.), a sea-port town of Albania, on the Caspian sea, between the rivers Casius and Albanus, now called *Bachu*, or *Bachy*, giving name to the Caspian sea, viz. *Mar de Bachu*. E. long. 49. 0. Lat. 40. 0.

ALBAHURIM, *figura sexdecim laterum*, a figure of great importance according to astrological physicians, who built their prognostics on it.

ALBANIA (*Encycl.*), a province of Turkey in Europe, is bounded by Livadia on the south, by Thessaly and Macedonia on the east, and on the north by Bosnia and Dalmatia. The people are strong, large, courageous, and good horsemen; but are said to be of a thievish disposition: the grand-seignior procures excellent soldiers from hence, particularly cavalry, known by the name of *Arnauts*. There are several large towns in this province; and the inhabitants are almost all Christians of the Greek church, and descended from the ancient Scythians. Formerly it was part of the kingdom of Macedonia. Their chief manufacture is carpets. The principal places are Durazzo, Velona, Antivari, Scutari, Croya, Alessio, Dibra, Dolcigno, and Albanapoli.

ALBANIA (*Encycl.*), a country of Asia, is bounded on the west by Iberia; on the east by the Caspian sea, on the north by mount Caucasus, on the south by Armenia and the river Cyrus, now Kur; which, springing from the *Mogebian* moun-

tains that separate Colchis from Armenia, and watering the country of *Mokan*, receives the Aragus and Araxes, and falls into the Caspian sea within a small distance from the southern borders of this country.—The whole country formerly called *Albania*, now goes under the names of *Shirvan* and *East Georgia*, and is extremely fruitful and pleasant. The ancient historians take notice of the Albanian men being tall, strong bodied, and, generally speaking, of a very graceful appearance; far excelling all other nations in comeliness, as well as stature. Modern travellers take no notice of the appearance of the men; but extol the beauty of the women, which seems to be unnoticed by the ancients. The Albanians were anciently an independent and pretty powerful people; but we find no mention made of their king, till the reign of Alexander the Great, to whom the king of Albania is said to have presented a dog of an extraordinary fierceness and size.—It does not appear that the Albanians were ever conquered by the Romans, even when their power was at its greatest height; though, when they ventured to engage in war with that powerful empire, they were always defeated, as might naturally be expected.

ALBANO (Francesco), a celebrated history and landscape painter, born at Bologna in 1578, who studied first in the school of Dennis Calvert at the same time with Guido, but placed himself afterward under the direction of the Caracci, and completed his studies at Rome. For the most part he painted in a small size, and chose his subjects from poetic or fabulous history: he was fond of introducing cupids, in a variety of actions and attitudes. It has been objected to him, that he was apt to preserve too great a similitude in his figures, and in the air of his heads; which arose from his painting after his wife and children as models. The style of his landscape is very agreeable, as his scenes and objects were studied from nature. In the king of Sardinia's palace at Turin, are the Four Elements painted by him, which are of extraordinary beauty, and well preserved. He died in 1660. He had a brother Giovanni Battista Albano, who was his disciple, and became an admirable painter in his style: he died in 1668.

ALBAN (St.), is said to have been the first person who suffered martyrdom for Christianity in Britain; he is therefore usually styled the protomartyr of this island. He was born at Verulam, and flourished towards the end of the third century. In his youth he took a journey to Rome, in company with Amphibalus a monk of Caerleon, and served seven years as a soldier under the emperor Dioclesian. At his return home, he settled in Verulam; and, through the example and instructions of Amphibalus, renounced the errors of paganism, in which he had been educated, and became a convert to the Christian religion. It is generally agreed, that Alban suffered martyrdom during the great persecution under the reign of Dioclesian; but authors differ as to the year when it happened: Bede and others fix it in 286; some refer it to the year 296; but Usserius reckons it amongst the events of 303. The story and circumstances relating to his martyrdom, according to Bede, are as follows. Being yet a pagan (or at least it not being known that he was a Christian), he entertained Amphibalus in his house. The Roman governor being informed thereof, sent a party of soldiers to apprehend Amphibalus; but Alban, putting on the habit of his guest, presented himself in his stead, and was carried before that magistrate. The governor having asked him of what family he was? Alban replied, "To what purpose do you enquire of my family? if you would know my religion, I am a Christian." Then being asked his name, he answered, "My name is Alban; and I worship the only true and living God, who created all things." The magistrate replied, if you

would enjoy the happiness of eternal life, delay not to sacrifice to the great gods." Alban answered, "The sacrifices you offer are made to devils; neither can they help the needy, or grant the petitions of their votaries." His behaviour so enraged the governor, that he ordered him immediately to be beheaded. In his way to execution, he was stopped by a river, over which was a bridge so thronged with spectators that it was impossible to cross it; the faint, as we are told, lifted up his eyes to heaven, and the stream was miraculously divided, and afforded a passage for himself and a thousand more persons. Bede does not indeed give us the name of this river; but, notwithstanding this omission, the miracle, we suppose, will not be the less believed. This wonderful event converted the executioner upon the spot, who threw away his drawn sword, and falling at St. Alban's feet, desired he might have the honour to die with him. This sudden conversion of the headman occasioning a delay in the execution, till another person could be got to perform the office, St. Alban walked up to a neighbouring hill, where he prayed for water to quench his thirst, and a fountain of water sprung up under his feet: here he was beheaded, on the 23d of June. The executioner is said to have been a signal example of divine vengeance; for as soon as he gave the fatal stroke, his eyes dropt out of his head. We may see the opinion of Mr. Milton in regard to this narrative, in his history of England: his words are these, speaking of St. Alban, "The story of whose martyrdom, soiled and worse martyred with the fabling zeal of some idle fancies, more fond of miracles than apprehensive of the truth, deserves no longer digression. Between 4 or 500 years after St. Alban's death, Offa king of the Mercians built a very large and stately monastery to his memory; and the town of St. Alban's in Hertfordshire takes its name from our protomartyr.

ALBANS, *St. (Encycl.)*, a market town of Hertfordshire, is seated near the ruins of an ancient Roman city, by Tacitus called *Verulam*; and by the Saxons *Watlingcester*, because it is seated on the road called *Watling-street*. Nothing now remains of Verulam, but the ruins of old walls; in the fields adjacent to which they continue to find Roman coins, as they formerly found tessellated pavements. In memory of St. Alban, Offa king of the Mercians, anno 795, erected an abbey, calling it *St. Alban's*; and near it the town of the same name was afterwards built. The church of the abbey is remaining to this day: time and the weather have made it look like stone on the outside; but if you break a bit off, the redness of the brick immediately appears. When the monasteries were dissolved, the townsmen paid £. 400 to prevent its being levelled with the ground, and have since converted it into a parish-church, which, for its largeness, beauty, and antiquity, claims a particular regard. It had a very noble font of solid brass, in which the children of the kings of Scotland were used to be baptized; and was brought from Edinburgh, by Sir Philip Lea, when that city was in flames; but in the times of the late civil wars, it was taken away. Not many years since, a tomb was discovered in this church, said to be that of Humphrey duke of Gloucester: when the leaden coffin was opened, the body was pretty entire, being preserved in a sort of pickle. There was a stately cross in the middle of the town, as there were in many other places where queen Eleanor's body rested when it was brought out of the north for interment at Westminster; but it has been demolished, as some say, by the inhabitants.

ALBANUS MONS (anc. geog.), now called *Mont Albano*, 16 miles from Rome, near where Alba Longa stood.

ALBANUS MONS (anc. geog.), to the north of Istria, called *Albius* by Strabo; the extremity of the Alps, which, together with the mountains to the east, joining it, called

Montes Bëbi, separate the farther Liburnia and Dalmatia from Pannonia.

ALBEMARLE, or **AUMARLE** (*Encycl.*), a town of France, in the department of the Lower Seine, and late province of Normandy. From hence the noble family of Keppel takes the title of *Earl*. Before the revolution, the ferges of this town were in high esteem. It is seated on the declivity of a hill, on the confines of Picardy.

ALBERONI (Julius), the son of a poor gardener, in the suburbs of Placentia, born in 1664; who, by his great abilities and good fortune, rose from this low original, to the employment of first minister of state at the court of Spain, and to the dignity of Cardinal. He roused that kingdom out of the lethargy it had sunk into for a century past; awakened the attention and raised the astonishment of all Europe, by his projects; one of which was to fet the Pretender on the throne of Great Britain. He was at length deprived of his employment, and banished to Rome: he died in 1752, at the great age of 89. His *Testament Politique*, collected from his memoirs and letters, was published at Lausanne in 1753.

ALBERTI (Leone Battista), was descended from a noble family in Florence; and was perfectly acquainted with painting, sculpture, and architecture. He wrote of all three in Latin; but his studies did not permit him to leave any thing considerable behind him in painting. He was employed by Pope Nicholas V. in his buildings, which he executed in a beautiful manner; and his work on architecture, which consists of ten books, is greatly esteemed. He also wrote some treatises of morality, and a piece on arithmetic. He died in 1485.

ALBERTUS (Magnus), a Dominican friar, and afterwards archbishop of Ratibon, was one of the most learned men and most famous doctors of the 13th century. He was by the ignorant charged with being a magician, and making a machine resembling a man, which they foolishly imagined explained all the difficulties he proposed to it. He died at Cologne, November 15, 1280. His works were printed at Lyons, in 1651, in 21 volumes folio.

ALBI, or **ALBY** (*Encycl.*), an ancient town of France, lately the capital of the territory of the Albigeois in Languedoc, and an archiepiscopal see. It is now the episcopal see of the department of Tarn, and contains 10,000 inhabitants. In point of architecture and decorations, the principal church is one of the most curious in France: it is celebrated for an organ, which, to the merit of construction and perspective, unites a tone and a *vox humana* in the highest perfection. The inhabitants were called Albigenes; they were the first that disputed the authority of the pope, and they were condemned by a council held here in 1176. The environs of Alby are charming: the magnificent walk, called *La Lice*, is a terrace, commanding a great mall, which is so deep, that it serves the town for fosses. The adjacent territory produces all kinds of grain, excellent wines, flax, hemp, saffron, aniseed, coriander, and woad. The fine pastures afford wool of a good quality, which is manufactured into knit stockings for the soldiers, ratteens of all colours, shalloons, coarse woollens, &c. The wax candles of Alby are equal in whiteness to those of Mans.

ALBIGENSES (*Encycl.*). This sect had their name, it is supposed, either by reason there were great numbers of them in the diocese of Albi, or because they were condemned by a council held in that city. In effect, it does not appear that they were known by this name, before the holding of this council. Other names given to them are *Henricians*, *Abelardists*, *Bulgarians*, &c. some on account of the qualities they assumed; others on that of the country from whence it is pretended they were derived: and others on account of per-

fons of note who adopted their cause, as Peter de Brias, Art nold de Bresse, Abelard, Henry, &c. Berengarius, if not Wickliff himself, is by some ranked in the number. The *Albigenses* are frequently confounded with the *Waldenses*; from whom, however, they differ in many respects, both as being prior to them in point of time, as having their origin in a different country, and as being charged with divers heresies, particularly Manichæism, from which the *Waldenses* are exempt. But several Protestant writers have vindicated them from that imputation. Dr. Allix shews, that a great number of *Manichees* did spread over the western countries from Bulgaria; and settled in Italy, Languedoc, and other places, where there were also *Albigenses*; by which means being both under the imputation of *heresy*, they came, either by ignorance or malice, to be confounded, and called by the same common name, though in reality entirely different.

Other errors imputed to them by their opponents, the monks of those days, were, That they admitted two Christs; one evil, who appeared on earth; the other good, who has not yet appeared: They denied the resurrection of the body; and maintained human souls to be demons imprisoned in our bodies, by way of punishment for their sins: That they condemned all the sacraments of the church; rejected baptism as useless; held the eucharist in abhorrence; excluded the use of confessions and penance; maintained marriage unlawful; laughed at purgatory, prayers for the dead, images, crucifixes, &c.—There were likewise said to be two classes of them, the Perfect and the Believers. The perfect boasted of their living in continence, of eating neither flesh, eggs, nor cheese. The believers lived like other men, and were even loose in their morals; but they were persuaded they should be saved by the faith of the perfect, and that none were damned who received imposition of hands from them. But from these charges also they are generally acquitted by Protestants; who consider them as the pious inventions of the Romish church, whose members deem it meritorious by any means to blacken heretics.

However this be, the Albigenes grew so formidable, that the Catholics agreed upon a holy league or crusade against them. They were at first supported by Raymond count of Toulouse. Pope Innocent III. desirous to put a stop to their progress, sent a legate into their country; which failing, he stirred up Philip Augustus king of France, and the other princes and great men of the kingdom, to make war upon them. Upon this the Count of Toulouse, who had sided with them, made his submission to the Pope, and went over to the Catholics: but soon after, finding himself plundered by the crusaders, he declared war against them, and was joined by the King of Arragon. His army was defeated at the siege of Muret, where he himself was killed, and the defeat followed by the surrender of the city of Toulouse, and the conquest of the greatest part of Languedoc and Provence. His son Raymond succeeded him; who agreed with the king and the pope to set up the inquisition in his estates, and to extirpate the Albigenes. In an assembly held at Milan, the Archbishop of Toulouse drew up articles; agreeable to which the count made a most ample declaration against them, which he published at Toulouse in 1253. From this time the Albigenes dwindled by little and little, till the times of the reformation; when such of them as were left fell in with the *Vauds*, and became conformable to the doctrine of Zuinglius and the discipline of Geneva.

The curious reader who desires to know more concerning the history of the *Albigenses*, may consult *Prætol*. Elench. Hær.

ALBIGENSES (*Encycl.*), as synonymous with *Waldenses*. This word is applied by Camerarius, Thuanus, and several other

writers. The reason seems to be, that both parties agreed in their opposition to the papal innovations and incroachments, though in divers other respects said to be different enough. The bishop of Meaux labours hard to support a distinction between the two sects, alleging that the *Albigenses* were heretics and Manichees; whereas the *Waldenses* were only schismatics, not heretics; being found as to articles of faith, and only separating from the church of Rome on account of ceremonies and discipline. Dr. Allix endeavours to set aside the distinction; and shews that both of them held the same opinions; and were equally condemned and held for heretics; and this not for points of faith, but for declaiming against the papal tyranny and idolatry, and holding the pope to be the Antichrist; which last, according to M. de Meaux, constitutes nothing less than Manicheism. In this sense the Lollards and Wickliffites in England were not only Albigenses, but Manichees.

ALBINTEMELIUM, **ALBINTIMILIUM** (Tacitus); or at full length, **ALBIUM INTEMELIUM** (Pliny, Strabo); now *Vintimiglia*, situated on the south-west of the territory of Genoa, near the borders of the county of Nice, with a port on the Mediterranean, at the mouth of the rivulet Rotta, almost about half way between Monaco and S. Remo. E. Long. 7. 40. Lat. 42. 17.

ALBIOECE, or **ALBEECE** (Pliny, Strabo); otherwise called *Reu Apollinares*, from their superstitious worship of Apollo; also *Civitas Reienjum*; now *Riez*, in Provence, about 18 leagues to the north-east of Toulon, on the north side of the rivulet Verdon; was originally a Roman colony (Inscription). It is sometimes written *Regium*. The people were called *Albici* (Cæsar). E. Long. 1. 0. Lat. 43. 20.

ALBINOVANUS, a Latin poet, whose Ovid furnished the *Divine*. There is now nothing of his extant, except an elegy on Drusus, and another on the death of Mæcenat.

ALBRICIUS, born at London, was a great philosopher, a learned and able physician, and well versed in all the branches of polite literature. He lived in the 11th century, and wrote several works in Latin, particularly, 1. *Of the Origin of the Gods*. 2. *The Virtues of the Ancients*. 3. *The Nature of Poison*, &c.

ALBUMAZAR, a learned Arabian astronomer in the tenth century, who wrote a treatise, *Of the Revolution of the Years*.

ALBUQUERQUE (Alphonso), a native of Portugal. Little is known of this great commander before he was appointed by his king, Emanuel, to the command of a squadron destined for India, where, by his exploits, he raised the arms of his country to the highest pitch of glory.

Emanuel, A. D. 1503, dispatched six ships to India, under the command of Albuquerque, and the same year three more under his cousin, Francis Albuquerque. The arrival of the Portuguese so alarmed the garrison that then had possession of Cochín, that they precipitately left it. Alphonso Albuquerque then sailed to Conlon to load three ships, which he completed without opposition, made an alliance with the people, and returned to Cochín. On his return he found the Zamorin ready to enter into a treaty of peace with him, which was concluded.

In 1508 Alphonso was appointed to succeed to the government of India, and dispatched with five ships; he sailed in company with Cugna, another Portuguese officer. Having plundered and taken some towns on the coast of Arabia, they sailed to Zocatora, and made themselves masters of the fort there. After which Cugna returned to Portugal, and Albuquerque began to act alone.

He immediately formed the design of attacking Ormuz

island, situated at the mouth of the Persian Gulph, and subject to a king of its own, who had extended his dominions over several cities in Arabia. With a small army of 470 men, he proceeded along the Arabian coast, took many towns, and proceeded to the island itself. He found several ships fitted for war in the harbour; these it was determined to burn. However, he first offered peace to the king, who entered into a treaty, with a view to gain time until a reinforcement arrived. The expected force came, and an engagement ensued, in which the Portuguese were victorious. Albuquerque then pressed the city; and the king finding no resource, solicited peace, on condition of becoming tributary to the king of Portugal. This was agreed to. Albuquerque went on shore, had an interview with the king, and knowing the perfidy of the Arabians, began to build a fortress. While this was carrying on some deputies arrived from the king of Persia, to demand tribute of the king of Ormuz. The latter consulted Albuquerque, who with great spirit told the deputies that his master paid no tribute, but arms. Albuquerque was, however, forced to desist by the perfidy of his officers, and to repair on board his fleet. He then renewed the war; but receiving a letter from the governor (Almeed) blaming his conduct, he proceeded for India: when, after some hesitation, Almeed resigned the government to him, and sailed to Europe.

Being now invested with the supreme command, he prepared a fleet, and sailed against Calicut, where, in a desperate and imprudent attack, he was dangerously wounded and forced to retreat.

Albuquerque being recovered, went to sea with twenty-three ships, two thousand Portuguese, and several Indian auxiliaries, designed for Ormuz; but, by the persuasion of Timoa, a piratical prince, changed his intention, and proceeded to attack Goa. The forts near it on the continent were taken and destroyed; and learning that the city was in the greatest consternation, he sent deputies to offer the people his protection, and the enjoyment of their religion. The citizens accepted the conditions, and Albuquerque entered Goa the following day, being the 16th of February, 1510. This city has long been the head of the Portuguese dominions in India. Here Albuquerque fixed his winter quarters, and behaved himself in such a manner as to merit the esteem of every one. But, while he was thus employed, some of the chief Portuguese began to murmur against him. However, by seizing and imprisoning the leaders, he quieted the disturbance. The enemy being informed of the dissensions of the Portuguese, made an attack upon the island, and landing men, laid siege to the city, pressing it hard. The situation of Albuquerque became now truly distressing, an enemy vastly superior without, discontent among his officers within, and his troops greatly diminished. These circumstances determined him to embark on board his ships, and evacuate the city, which he effected after a fierce combat, having first set fire to the magazines.

He then fled to a place called Rapander to winter; but the enemy soon obliged him to remove, and take shelter between the continent and the island of Divar, where he was informed his enemies were all preparing to make an attack upon him. In this extremity, being also very scarce of provisions, he determined to make a desperate effort on a strong castle, called Pangin. Accordingly, having stationed a force to prevent succours being sent to it, he proceeded under cover of the night, and succeeded in surprising both the fort and camp of the enemy, both which were taken without much resistance.

Such an unexpected turn of good fortune determined him

not only to object to offers of peace, but also to make an attack on Goa. In this he succeeded, having in the attack killed 3000 of the enemy.

Such success induced him to aim at greater enterprizes. Having collected his forces, he sailed from Goa to the island of Sumatra, and in every voyage made many captures; then having concluded a treaty with the princes of this island, he proceeded to the city of Malacca, and made himself master of it. Having settled affairs there, he returned to Goa, laid siege to the city of Benatar, and having been unsuccessful, consented to a peace with the Zamorin. He then built a fort at Calicut, and sailed to Aden, in hopes of making himself master of it, but was disappointed, and obliged to return. Soon after he fell sick and died, having first had the mortification to hear of his being recalled by the king.

To this great man the Portuguese owe the foundation of the immense power they once possessed in India; and, had they pursued the maxims he laid down, might possibly have enjoyed to this day. He was a man of great humanity, dreaded for his bravery, and beloved for his benevolent disposition. His death was most sincerely felt by all the people of Goa, where he was buried with great funeral honours.

ALCA (*Encycl.*), or AUK, in ornithology, a genus of the order of anseres. To our article in Vol. I. we have omitted to annex the delineations, so essential in subjects of natural history, which we now supply. In Pl. 12. of this volume will be found representations of the first, second, and seventh species of this bird.

ALCEUS, a famous ancient lyric poet, was born at Mitylene, in the island of Lesbos. He flourished in the 44th Olympiad, at the same time with Sappho, who was likewise of Mitylene. In the time of Alceus, Mitylene suffered under the oppression of Pittacus. He headed a strong party for the deliverance of his country; but in this proved unsuccessful, and was taken prisoner by Pittacus, who gave him his liberty, although he had been treated by him in a most abusive manner.

Alceus was much addicted to the detestable Greek vice, the love of boys. The name of his favourite was Lycus, of whom Horace speaks; and who is probably the boy whom Cicero notes for having a mole upon his finger, which, in the poet's eye, was a beauty.

The poetical abilities of Alceus are undisputed; and though his writings were chiefly in the lyric strain, yet his muse was capable of treating the sublimest subjects with a suitable dignity.

ALCEUS, an Athenian tragic poet, and, as some think, the first composer of tragedies. He renounced his native country Mitylene, and passed for an Athenian. He left ten pieces, one of which was *Paiphaë*, that which he produced when he disputed with Aristophanes, in the fourth year of the 97th Olympiad.

There is another ALCEUS mentioned in Plutarch, perhaps the same whom Porphyrius mentions as a composer of satirical fables and epigrams, and who wrote a poem concerning the plagiarism of Euphorus the historian. He lived in the 145th Olympiad.

We are told likewise of one ALCEUS, a Messenian, who lived in the reign of Vespasian and Titus. We know not which of these it was who suffered for his lewdness a very singular kind of death, which gave occasion to the following epitaph:

Ἀλκαῖος τὰ φος ἐπὶ τοῦ, &c.

This is Alceus's tomb, who died by a radish,
The daughter of the earth, and punisher of adulterers.

This punishment inflicted on adulterers, was, thrusting one of the largest radishes up the anus of the adulterer: or, for want of radishes, they made use of a fish with a very large head, which Juvenal alludes to:

Quosdam machos et mugilis intrat.

The mullet enters some behind.

Hence we may understand the menace of Catullus,

Ah! tum te miserum, malique fati,

Quem attractis pedibus, patente porta,

Percurrent raphanice mugilesqve. EPIC. XV.

Ah! wretched thou, and born to luckless fate,

Who art discover'd by the unshut gate!

If once, alas! the jealous husband come,

The radish, or the sea-fish, is thy doom.

ALCAIC ODE (*Encycl.*). The following strophe is of this species, which Horace calls *minuas Alcai camenæ*.

Non possidentem multa vocaveris

Recte beatum: rectius occupat

Nomen beati, qui deorum

Muneribus sapienter uti, &c.

ALCAMER, an ancient and handsome town of the United Provinces, in North Holland. In the environs, they make the best butter and cheese in Holland, and have the finest tulips. It is 17 miles N. by W. of Amsterdam. Long. 4.43. E. Lat. 52.40. N.

ALCAMO, a town of Sicily, in the valley of Mazaro, at the foot of Mount Bonifati. Long. 13. 52. E. Lat. 38. 2. N.

ALCEDO (*Encycl.*), in ornithology. There are seven species of the Alcedo, most worthy of notice, viz.

1. The *hyssida*, or common kingfisher (see Pl. 12.), haunts the shores of Europe and Asia. It is not much larger than a swallow; its shape is clumsy; the bill disproportionately long; it is two inches from the base to the tip; the upper chap black, and the lower yellow. But the colours of this bird atone for its inelegant form: the crown of the head and the coverts of the wings are of a deep blackish green, spotted with bright azure; the back and tail are of the most resplendent azure; the whole under-side of the body is orange-coloured; a broad mark of the same passes from the bill beyond the eyes; beyond that is a large white spot: the tail is short, and consists of twelve feathers of a rich deep blue; the feet are of a reddish yellow, and the three joints of the out-most toe adhere to the middle toe, while the inner toe adheres only by one.

From the diminutive size, the slender short legs, and the beautiful colours of this bird, no person would be led to suppose it one of the most rapacious little animals that skims the deep. Yet it is for ever on the wing, and feeds on fish; which it takes in surprising quantities, when we consider its size and figure. It takes its prey after the manner of the osprey, balancing itself at a certain distance above the water for a considerable space, then darting into the deep, and seizing the fish with inevitable certainty. While it remains suspended in the air, in a bright day, the plumage exhibits a beautiful variety of the most dazzling and brilliant colours. This striking attitude did not escape the notice of the ancients; for Ibycus, as quoted by Athenæus, styles these birds *αλκυονες, τανδριπτεροι*, the halcyons with expanded wings. It makes its nest in holes in the sides of the cliffs, which it scoops to the depth of three feet; and lays from five to nine eggs, of a most beautiful semi-transparent white: the nest is very

setid, by reason of the remains of the fish brought to feed the young. The female begins to lay early in the season; and excludes her first brood about the beginning of April. The male, whose fidelity exceeds even that of the turtle, brings her large provisions of fish while she is thus employed; and she, contrary to most other birds, is found plump and fat at that season. The male, that used to twitter before this, now enters the nest as quietly and as privately as possible. The young ones are hatched at the expiration of twenty days; but are seen to differ as well in their size as in their beauty.

This species is the *αλιευαυρος*, or mute halcyon of Aristotle, which he describes with more precision than is usual with that great philosopher: after his description of the bird, follows that of its nest, than which the most inventive of the ancients have delivered nothing that appears at first sight more fabulous and extravagant. He relates, that it resembled those concretions that are formed by the sea-water; that it resembled the long-necked gourd; that it was hollow within; that the entrance was very narrow, so that, should it over-set, the water could not enter; that it resisted any violence from iron, but could be broke with a blow from the hand; and that it was composed of the bones of the *Balaen*, or sea-needle. The nest had medical virtues ascribed to it; and from the bird was called *Halcyonum*. In a fabulous age, every odd substance that was hung ashore received that name; a species of tubular coral, a sponge, a zoophite, and a miscellaneous concrete, having by the ancients been dignified with that title from their imaginary origin. Yet much of this seems to be founded on truth. The form of the nest is justly described; and the materials which Aristotle says it was composed of, are not entirely of his own invention. Whoever has seen the nest of the kingfisher, will observe it strewn with the bones and scales of fish; the fragments of the food of the owner and its young.—On the foundation laid by the philosopher, succeeding writers formed other tales extremely absurd; and the poets, indulging the powers of imagination, dressed the story in all the robes of romance. This nest was a floating one:

Incubat *halcyone* pendentibus æquore nidis;

OVID. Met. lib. xi.

It was therefore necessary to place it in a tranquil sea, and to supply the bird with charms to allay the fury of a turbulent element during the time of its incubation; for it had, at that season, power over the seas and the winds.

Ἄλκυονες σερπεννὶ τὰ κυματα, τῇ τὴ θαλάσσει,
Τοι τὸ νῆος, τοὶ τ' ὑπὸ, αἱ ἐρχομαι φινία κινῆ
Ἀλκυονες, ἡλακκας Νηρηίδας τὰι τὴ μαλιστα
Ορηδῶν ἱερὰδες.

THEOCRIT. Idyl. vii. l. 57.

May *Halcyons* smooth the waves, and calm the seas,
And the rough fourth-east sink into a breeze;
Halcyons, of all the birds that haunt the main,
Most lov'd and honour'd by the *Nereid* train. FAWKES.

These birds were equally favourites with *Thetis* as with the *Nereids*;

Dilectæ *Thetidi* *Halcyones*. VILCO. Georg. I. 399.

as if to their influence these deities owed a repose in the midst of the storms of winter, and by their means were secured from those winds that disturb their submarine retreats, and agitated even the plants at the bottom of the ocean.

Such are the accounts given by the Roman and Sicilian poets. Aristotle and Pliny tell us, that this bird is most common in the seas of Sicily: that it sat only a few days, and those in the depth of winter; and during that period the mariner might sail in full security; for which reason they were styled *Halcyon days*.

VOL. X.

Perque dies placidos hiberno tempore septem
Incubat *Halcyone* pendentibus æquore nidis :
Tum via tuta maris : ventos custodit, et arcet
Æolus egressu.

OVID. Met. lib. XI.

Alcyone, compressed,
Seven days sits brooding on her watery nest,
A wintry queen; her fire at length is kind,
Calms every storm, and hushes every wind. DRYDEN.

In after-times, these words expressed any season of prosperity: these were the *Halcyon days* of the poets; the brief tranquillity, the *septem placidis dies*, of human life.

The poets also made it a bird of song. Virgil seems to place it in the same rank with the linnet;

Littoraque *Halcyonem* resonant, et *Acanthida* dumi.

GEORG. III. 338.

And *Silius* *Italicus* celebrates its music, and its floating nest:

Cum sonat *Halcyone* cantu, nidisque natantes.

Immotæ gestat sopitis fluctibus undæ. Lib. XIV. 275.

But these writers seem to have transferred to our species, the harmony that belongs to the vocal *alcedo*, one of the loveliest birds of the ancients.

As the ancients have had their fables concerning this bird, so have the modern vulgar. It is an opinion generally received among them, that the flesh of the kingfisher will not corrupt, and that it will even banish all vermin. This has no better foundation than that which is said of its always pointing, when hung up dead, with its breast to the north. The only truth which can be affirmed of this bird when killed is, that its flesh is utterly unfit to be eaten; while its beautiful plumage preserves its lustre longer than that of any other bird we know.

The other species are, 2. The *erasthaca*, with a short tail, a blue back, a yellow bill, a purple head and rump, and the throat and opposite part of the neck white. It is a native of Bengal. 3. The *alcyon* with a short black tail, white belly, and ferruginous breast. It is a native of America. Its cry, its solitary abode about rivers, and its manner of feeding, are much the same as of those in Britain. It preys not only on fish, but likewise on lizards. 4. The todus, with a short green tail, a blood-coloured throat, and a white belly. It is a native of America; and is the green sparrow, or green humming-bird, of Edwards. 5. The *myrmensis*, with a short green tail, ferruginous wings, and a green back. It is a native of Africa, and Asia. 6. The *rudis*, with a short brown tail variegated with white. It is a native of Persia and Egypt. 7. The *dea*, with two very long feathers in the tail, a blackish blue body, and greenish wings. It is a native of Surinam. All these likewise dive in the water, and catch fish with their long beaks.

ALCIAT (Andrew), a great lawyer, who flourished in the 16th century, born at Milan. He mixed much of polite learning in the explication of the laws, and happily drove out the barbarity of language which till then had reigned in the lectures and writings of lawyers; for which Thuanus highly praises him. He published a great many law-books, and some notes upon Tacitus. His Emblems have been much admired, and translated into French, Italian, and Spanish; and several learned men have written commentaries on them.

ALCIBIADES (*Encyc.*), an Athenian general. It was the fate of this great man to live at a time when his country was a scene of confusion. The Greeks, grown insolent from their conquests in Persia, turned their arms against each other, and struggled together under the conduct of the two most opulent states, Athens and Lacedæmon. Alcibiades, in the midst of an expedition he had planned against the enemy of

his country, was recalled home to answer some charge of a private nature; but fearing the violence of his enemies, instead of going to Athens, he offered his services at Sparta, where they were readily accepted. By his advice the Lacedæmonians made a league with Persia, which gave a very favourable turn to their affairs. But his credit in the republic raising jealousies against him, he privately reconciled himself to his country, and took again the command of an Athenian army. Here victory, waiting as it were at his command, attended all his motions. The loss of seven battles obliged the Spartans to sue for peace. He enjoyed his triumphs, however, only a short time at Athens. One unsuccessful event made him again obnoxious to the malice of his citizens; and he found it expedient to retire from Athens. In his absence the Spartans again took the lead, and at the fatal battle of Ægos entirely subdued the Athenian power. Alcibiades, though an exile, endeavoured to restore the power of his country; of which the Spartans having intelligence, procured him to be assassinated. He was a man of admirable accomplishments, but indifferently principled; of great parts; and of an amazing verifiability of genius.

ALCINOUS, king of the Phæaciæns, in the island now called *Corfu*, was son of Naufithous, and grandson of Neptune and Peribea. It is by his gardens this king has chiefly immortalized his memory. He received Ulysses with much civility, when a storm had cast him on his coast. The people here loved pleasure and good cheer, yet were skilful seamen; and Alcinoüs was a good prince.

ALCMAN, a lyric poet, who flourished in the 27th Olympiad. He was born at Sparta; and composed several poems, of which only some fragments are remaining, quoted by Athenæus and some other ancient writers. He was very amorous; accounted the father of gallant poetry; and is said to have been the first that introduced the custom of singing love-songs in company. He is reported to have been one of the greatest eaters of his age; upon which Mr. Bayle remarks, "that such a quality would have been extremely inconvenient, if poetry had been at that time upon such a footing as it has been often since, not able to procure the poet bread. He died of a strange disease; for he was eaten up with lice."

ALCMENA, the daughter of Electryö king of Mycenæ, and wife of Amphitryon. Jupiter putting on the shape of her husband while he was abroad in the wars, begot Hercules upon her: he made that night as long as three ordinary ones.

ALCOA ARBOR, the name of a tree in St. Helena, said to emulate ebony.

ALCOCK (John), doctor of laws, and bishop of Ely in the reign of King Henry VII. born at Beverly in Yorkshire, and educated at Cambridge. He was first made dean of Westminster, and afterwards appointed master of the rolls. In 1471, he was consecrated bishop of Rochester; in 1476, he was translated to the see of Worcester; and in 1486, to that of Ely, in the room of Dr. John Morton, preferred to the see of Canterbury. He was a prelate of great learning and piety; and so highly esteemed by King Henry, that he appointed him lord president of Wales, and afterwards lord chancellor of England. Alcock founded a school at Kingston-upon-Hull, and built the spacious hall belonging to the episcopal palace at Ely. He was also the founder of Jesus' College in Cambridge, for a master, six fellows, and as many scholars. This house was formerly a nunnery, dedicated to St. Radigund; and, as Godwin tells us, the building being greatly decayed, and the revenues reduced almost to nothing,

the nuns had all forsaken it, except two; whereupon Bishop Alcock procured a grant from the crown, and converted it into a college. But Cambden and others tell us, that the nuns of that house were so notorious in their incontinence, that King Henry VII. and Pope Julius II. consented to its dissolution: Bale accordingly calls this nunnery *spiritualium meretricum cenobium*, "a community of spiritual harlots." Bishop Alcock wrote several pieces, amongst which are the following: 1. *Mont Perfectionis*. 2. *In Pfalmis Penitentiales*. 3. *Homilie Fulgares*. 4. *Meditationes Pivæ*. He died October 11, 1500; and was buried in the chapel he had built at Kingston-upon-Hull.

ALCONCHOE, a castle of Spain, on the frontiers of Éstramadura, seated on the river Alcaraque, that falls into the Guadiana, 20 miles S. by W. of Badajoz. Long. 6. 58. W. Lat. 38. 12. N.

ALCOUTIM, a town of Portugal, in the province of Algarva. It is seated on the river Guadiana, and contains about 1000 inhabitants. Long. 7. 20. W. Lat. 37. 20. N.

ALCUDIA, a town in Majorca, consisting of about 1000 houses, between two large harbours. Long. 3. 0. E. Lat. 39. 50. N.

ALCUINUS (Flaccus), an ecclesiastic of the eighth century. Where he was born, is a matter of dispute; but, according to the most probable opinion, it was in Yorkshire. It is pretty certain, however, that he was educated first under Bede, and afterwards by Egbert archbishop of York, by whom he was made keeper of the library of that city (A). He thence rose to be deacon of the church, and afterwards became abbot of Canterbury. In the year 793 he went over to France, upon the invitation of Charlemagne, by whom he was greatly cared for, and amply provided for. He was not only honoured with his friendship and confidence, but became his instructor in rhetoric, logic, mathematics, and divinity. He attended him to the council of Francfort; and, at his return, was presented with the abbey of Ferrara, St. Jodocus, and St. Lupus. He retired at last to the abbey of St. Martin at Tours, where he spent the latter part of his life, and died in the year 804. Doubtless, he was one of the best scholars and wisest men of his time. Francé was chiefly indebted to him for her improvements in literature. The universities of Paris, Tours, Falden, Soissons, and many others, owe to him their origin and increase; and to him was owing the institution of learned academies, at least the first one we read of was set on foot by the emperor at his instigation. His works were collected and published by Andrew du Chesne in one volume folio, Paris, 1617. They consist of, 1. Tracts upon scripture. 2. Tracts upon doctrine, discipline, and morality. 3. Historical treatises, letters, and poems. Since this edition, there has been published an incredible number of tracts, poems, &c. ascribed to this author, most of which, in all probability were not his.

ALCYONIUM STAGNUM (anc. geog.), a lake in the territory of Corinth, whose depth was unfathomable, and in vain attempted to be discovered by Nero: through this lake Bacchus is said to have descended to hell, to bring back Semele; (Pausanias).

ALCYONIUS (Peter), a learned Italian, who flourished in the 16th century. He was well versed in the Greek and Latin tongues, and wrote some pieces of eloquence which met with great approbation. He was corrector of the press a considerable time for Aldus Manutius, and is entitled to a share in the praises given to the editions of that learned printer. He published a treatise concerning banishment,

(A) William of Malmshury calls this library *omnium liberalium artium armarium*. It was destroyed by fire in the reign of King Stephen, with great part of the city of York,

which contained so many fine passages intermixed with others quite the reverse, that it was thought he had tacked to somewhat of his own, several fragments of a treatise of *Cicero de gloria*; and that afterwards, in order to save himself from being detected in this theft, he burnt the manuscript of Cicero, the only one extant. Paulus Manutius, in his commentary upon these words of Cicero, "Librum tibi celeriter mittam de gloria—I will speedily send you my treatise on glory," has the following passage relating to this affair: "He means (says he) his two books On Glory, which were handed down to the age of our fathers; for Bernard Justinian, in the index of his books, mentions *Cicero de Gloria*. This treatise however, when Bernard had left his whole library to a nunnery, could not be found, though sought after with great care: nobody doubted but Peter Alcyonius, who, being physician to the nunnery, was entrusted with the library, had basely stole it. And truly, in his treatise Of Banishment, some things are found interperfed here and there, which seem not to favour of Alcyonius, but of some higher author." The two orations he made after the taking of Rome, wherein he represented very strongly the injustice of Charles V. and the barbarity of his soldiers, were excellent pieces. There is also an oration ascribed to him, on the knights who died at the siege of Rhodes.

ALDEA, a town of Portugal, in Estramadura, 10 miles S. E. of Lisbon. Long. 8. 55. W. Lat. 38. 36. N.

ALDERBURY, a village in Wiltshire, on a healthy hill, in a good sporting country, and near the Avon. It carries on a manufacture of fustians, and received considerable damage by a fire in Sept. 1777, when 200 houses were destroyed. It is two miles from Salisbury.

ALDHelm, or ADELm (St.), an English divine, was bishop of Shireburn in the time of the Saxon heptarchy. William of Malmesbury says, that he was the son of Kenred, or Kenter, brother of Ina king of the West Saxons. He was born at Caer Bladon, now Malmesbury, in Wiltshire. He had part of his education abroad in France and Italy, and part at home under Maildulfus an Irish Scot, who had built a little monastery where Malmesbury now stands. Upon the death of Maildulfus, Aldhelm, by the help of Eleutherius bishop of Winchester, built a stately monastery there, and was himself the first abbot thereof. When Hedda bishop of the West Saxons died, the kingdom was divided into two dioceses, viz. Winchester and Shireburn, and King Ina promoted Aldhelm to the latter, comprehending Dorsetshire, Wiltshire, Devonshire, and Cornwall: he was consecrated at Rome by Pope Sergius I. and Godwin tells us that he had the courage to reprove his holiness for having a baftard. Aldhelm, by the directions of a diocesan synod, wrote a book against the mistake of the Britons concerning the celebration of Easter, which brought over many of them to the catholic usage in that point. He likewise wrote a piece, partly in prose and partly in hexameter verse, in praise of virginity, dedicated to Ethelburga abbess of Barking, and published amongst Bede's *Opuscula*, besides several other treatises, which are mentioned by Bale and William of Malmesbury. The monkish authors, according to custom, have ascribed several miracles to Aldhelm; and they tell us, that, in order to put his virtue to trial, he used frequently to lay all night with a young woman, and yet without violating his chastity. He is said to have been the first Englishman who ever wrote in Latin, and, as he himself tells us in one of his treatises on metre, the first who introduced poetry into England. Aldhelm lived in great esteem till his death, which happened May the 25th, 709.

ALDHUN, the first bishop of Durham, succeeded Elsig in the bishopric of Lindisfarne or Holy Island, in the year 990. He was of a noble family, but, according to Simeon of

Durham, more ennobled by his virtues and religious deportment. He sat about six years in the see of Lindisfarne, during which time that island was greatly exposed to the incursions of the Danish pirates. This made him think of removing from thence; though Simeon of Durham says he was put upon it by an admonition from heaven. However, taking with him the body of St. Cuthbert, which had been buried there about 113 years, and accompanied by all the monks and the rest of the people, he went away from Holy Island; and, after wandering about some time, at last he settled with his followers at Dunelm, now called Durham; where he gave life both to the city and cathedral church. He had a daughter named Ecgrid, whom he gave in marriage to Ufthred, son of Waltheof, earl of Northumberland, and with her six towns belonging to the episcopal see, upon condition that he should never divorce her. But that young lord afterwards repudiating her, Aldhun received back the church lands he had given with her. This prelate educated King Ethelred's two sons, Alfred and Edward; and, when their father was driven from his throne by Swane king of Denmark, he conducted them, together with Queen Emma, into Normandy, to Duke Richard, the queen's brother. This was in the year 1017, a little before Bishop Aldhun's death. For the next year, the English having received a terrible overthrow in a battle with the Scots, the good bishop was so affected with the news, that he died a few days after, having enjoyed the prelacy twenty-nine years.

ALDPORT, an ancient name for Manchester.

ALDRICH (Robert), bishop of Carlisle, was born at Burnham in Buckinghamshire about the year 1493, and educated at Eaton-school; from whence, in 1507, he was elected scholar of King's College, Cambridge, where he took his degrees in arts, and was afterwards proctor of the university. In 1525 he was appointed master of Eaton-school, then became fellow of that college, and finally provost. In 1529 he went to Oxford, where, being first incorporated bachelor of divinity, in the following year he proceeded doctor in that faculty: in 1531 he was made arch-deacon of Colchester; in 1534, canon of Windsor; and the same year, registry of the order of the garter. He was consecrated bishop of Carlisle in the year 1537, and died at Horncastle in Lincolnshire in 1556. He wrote, 1. *Epistola ad Gul. Hormanum*, in Latin verse; printed in Horman's *Antibossicon*, Lond. 1521, of which book Pitts erroneously makes Aldrich the author. 2. *Epigrammata varia*. 3. *Latin verses, and another epistle to Horman*, prefixed to the *Vulgaria puerorum* of that author, Lond. 1519, 4to. 4. *Answers to certain queries concerning the abuses of the mass*; also about receiving the sacrament.

ALDRICH (Dr. Henry), an eminent English divine and philosopher, born at London in 1647, was educated at Westminster school under the famous Dr. Busby, and admitted of Christ-church College, Oxford. He had a great share in the controversy with the Papists in the reign of James II. and bishop Burnet ranks him among those who examined all the points of popery with a solidity of judgment, clearness of argument, depth of learning, and vivacity of writing, far beyond any who had before that time written in our language. He rendered himself so conspicuous, that at the revolution, when Massey the popish dean of Christ-church fled, his deanery was conferred on him. In this station he behaved in an exemplary manner, and that fabric owes much of its beauty to his ingenuity: it was Aldrich who designed the beautiful square called *Peckwater-Quadrangle*, which is esteemed an excellent piece of architecture. In imitation of his predecessor Dr. Fell, he published, yearly, a piece of some ancient Greek author, as a present to the students of his house: he

published *A System of Logic*, with some other pieces; and the revising Clarendon's History of the Rebellion, was intrusted to him and Bishop Spratt. He died about the year 1711.

ALDROVANDUS (Ulysses), professor of philosophy and physic at Bologna, the place of his nativity, was a most curious enquirer into natural history, and travelled into the most distant countries on purpose to inform himself of their natural productions. Minerals, metals, plants, and animals, were the objects of his curious researches; but he applied himself chiefly to birds, and was at great expence in having figures of them drawn from the life. Aubert le Mire says, that he gave a certain painter, famous in that art, a yearly salary of two hundred crowns, for thirty years and upwards; and that he employed at his own expence Lorenzo Benuini and Cornelius Swintus, as well as the famous engraver Christopher Coriolanus. These expences ruined his fortune, and at length reduced him to the utmost necessity; and it is said that he died blind in an hospital at Bologna, at a great age, in 1635.

Mr. Bayle observes, that antiquity does not furnish us with an instance of a design so extensive and so laborious as that of Aldrovandus, with regard to natural history; that Pliny indeed has treated of more subjects, but only touches them lightly, whereas Aldrovandus has collected all he could meet with. His compilation, or what at least was compiled upon his plan, consists of several volumes in folio, some of which were printed after his death. He himself published his Ornithology, or History of Birds, in three folio volumes, in 1599; and his seven books Of Insects, which make another volume of the same size.—The volume Of Serpents, three Of Quadrupeds, one Of Fishes, that Of exsanguineous Animals, the History of Monsters, with the Supplement to that Of Animals, the treatise Of Metals, and the Dendrology or History of Trees, were published at several times after his death, by the care of different persons.

ALDUABIS (anc. geog.), a river of Celtic Gaul, which rising from mount Jura, separating the Sequani from the Helvetii, and running through the county of Burgundy, or the Franche Comté, environs almost on every side the city of Besançon; and running by Dole, falls into the Saône near Chalons. In Cæsar it is called *Alduadubis*; in Ptolemy, *Dubis*; now le *Doux*.

ALEANDER (Jerome), cardinal and archbishop of Brindisi, was born in 1480; and distinguished himself at the beginning of the reformation, by the opposition he made to Luther; for being sent into Germany as the pope's nuncio in 1519, he acted, as occasion served, in the character both of ambassador and doctor; and declaimed three hours together against Luther's doctrine before the diet of Worms, but could not prevent that celebrated reformer from being heard in that diet. He published several works, and died at Rome in 1542.

ALEANDER (Jerome), a learned man of the seventeenth century, born in the principality of Friuli, of the same family with the preceding. When he went to Rome, he was employed as secretary under Cardinal Octavianus Bandini, and discharged this office with great honour for almost twenty years. He afterwards, by the persuasion of Urban VIII. who had a great esteem for him, became secretary to Cardinal Barberini, whom he accompanied to Rome when he went there in the character of legate *a latere*; and in whose service he died in 1631. He was one of the first members of the academy of Humorists, wrote a learned treatise in Italian on the device of the society, and displayed his genius on many different subjects. Barberini gave him a magnificent funeral at the academy of Humorists; the academists carried his corpse to the grave; and Gaspar Simeonibus, one of the members, made his funeral oration.

ALECTOROMANTIA (*Encycl.*). This is otherwise call-

ed *Alethromancy*; of which there appear to have been different species. But that most spoken of by authors was in the following manner: A circle being described on the ground, and divided into twenty-four equal portions, in each of these spaces was written one of the letters of the alphabet, and on each of the letters was laid a grain of wheat; after which, a cock being turned loose in the circle, particular notice was taken of the grains picked up by the cock, because the letters under them, being formed into a word, made the answer desired. It was thus, according to Zonaras, that Libanius and Jamblicus sought who should succeed the Emperor Valens; and the cock eating the grains answering to the spaces ΘΣΟΑ, several whose names began with those letters, as Theodotus, Theodiscus, Theodulus, &c. were put to death; which did not hinder, but promote, Theodosius to the succession. But the story, however current, is but ill supported: it has been called in question by some, and refuted by others, from the silence of Marcellinus, Socrates, and other historians of that time.

ALEGAMBE (Philip), a celebrated Jesuit, born at Brussels in 1592, distinguished himself by publishing a Bibliothéque of the writers of his order, and died at Rome in 1652.

ALEIUS CAMPUS, in ancient geography (Homer, Strabo, Pliny); a plain in Cilicia, on this side the river Pyramus, near the mountain Chimera, famous for Bellerophon's wandering and perishing there, after being thrown off Pegasus; which is the reason of the appellation.

ALEMANIA, or ALLEMANIA (anc. geog.), a name of Germany, but not known before the time of the Antonines, and then used only for a part. After the Marcomanni and their allies had removed from the Rhine; a rabble, or collection of people from all parts of Gaul, as the term *Alemanni* denotes, prompted either by levity or poverty, occupied the Agri, called *Decumates* by Tacitus, because they held them on a title; now supposed to be the duchy of *Wurtemberg*. Such appear to be the small beginnings of Alemania, which was in after-times greatly enlarged: but still it was considered as a distinct part; for Caracalla, who conquered the Alemanni, assumed the surname both of *Alemannicus* and *Germanicus*.

ALENIO (Julius), a Jesuit, born at Brescia in the republic of Venice. He travelled into the eastern countries; and arrived at Maca in 1610, where he taught mathematics. From thence he went to the empire of China, where he continued to propagate the Christian religion for thirty-six years. He was the first who planted the faith in the province of Xanfi, and he built several churches in the province of Fokien. He died in August 1649, leaving behind him several works in the Chinese language.

ALENZON, or ALENÇON (*Encycl.*), a town of France, is situated in the department of Orne, and late province of Normandy, with the title of a duchy. It is surrounded with good walls, and flanked with towers. The castle was formerly a place of great consequence, and has held out long sieges. It has but one parish-church, which has a bold and noble front. Among the nunneries, that of St. Clair is most remarkable. It is seated on the river Sarthe, in a vast open plain, which produces all sorts of corn and fruit. Near it there are quarries of stone fit for building, wherein are found a sort like Bristol stones. The linen made at Alençon is very good, and sells at Paris. It is 20 miles north of Mans, 63 south-by-west of Rouen, and 88 south-west of Paris. Long. o. 10. N. lat. 48. 25.

AALERIA, ALALIA, or ALARIA (anc. geog.), a town of Corsica, situated near the middle of the east side of the island, on an eminence, near the mouth of the river Rotanus mentioned by Ptolemy; built by the Phœacians (Diodorus Siculus). Afterwards Sylla led a colony thither. It is now in ruins, and called *Aleria Distrutta*.

ALES (Alexander), a celebrated divine of the confession of Augsburgh, born at Edinburgh the 23d of April, 1500. He soon made a considerable progress in school-divinity, and entered the lists very early against Luther, this being then the great controversy in fashion, and the grand field wherein all authors, young and old, used to display their abilities. Soon after, he had a share in the dispute which Patrick Hamilton maintained against the ecclesiastics, in favour of the new faith he had imbibed at Marpurg: he endeavoured to bring him back to the Catholic purgish; but this he could not effect, and even began himself to doubt about his own religion, being much affected by the discourse of this gentleman, and still more by the constancy he shewed at the stake, where David Beton, archbishop of St. Andrew's, caused him to be burnt. Beginning thus to waver, he was himself persecuted with so much violence, that he was obliged to retire into Germany, where he became at length a perfect convert to the Protestant religion. The change of religion which happened in England after the marriage of Henry VIII. with Anna Bullen, induced Ales to go to London, in 1535. He was highly esteemed by Cramer archbishop of Canterbury, Latimer, and Thomas Cromwel, who were at that time in high favour with the king. Upon the fall of these favourites, he was obliged to return to Germany; where the elector of Brandenburg appointed him professor of divinity at Francfort upon the Oder, in 1540. But leaving this place upon some disgust, he returned to Leipzig, where he was chosen professor of divinity, and died in March 1565. He wrote a Commentary on St. John, on the Epistles to Timothy, and on the Psalms, &c.

ALESA, ALESA, or HALESA (anc. geog.), a town of Sicily, on the Taſcan sea, built, according to Diodorus Siculus, by Archonides of Herbita, in the second year of the ninety-fourth Olympiad, or four hundred and three years before Christ; situated on an eminence about a mile from the sea: now in ruins. It enjoyed immunity from taxes under the Romans (Diodorus, Cicero). The inhabitants were called *Halasini* (Cicero, Pliny); also *Alesini*, and *Alesini*.

ALESIA (anc. geog.), called *Alexia* by Livy and others; a town of the Mandubii, a people of Celtic Gaul; situated, according to Cæsar, on a very high hill, whose foot was washed on two sides by two rivers. The town was of such antiquity, that Diodorus Siculus relates it was built by Hercules. It is supposed to be the city of *Alise*, in the duchy of Burgundy, not far from Dijon.

ALESSANO, a town of Otranto, in the kingdom of Naples, with a bishop's see, 15 miles S. W. of the town of Otranto. Long. 18. 25. E. Lat. 40. 10. N.

ALESSIA, a town of Turkey in Europe, in Albania; it is a bishop's see, near the mouth of the Drino. Long. 20. 6. E. Lat. 42. 8. N.

ALESSIO, a town of Turkey, in Dalmatia. It is a bishop's see, and seated on a mountain, 25 miles from Spalatro.

ALETUM, or ALETA (anc. geog.), a town of Celtic Gaul, now extinct. From its ruins arose St. Malo, in Britany, at the distance of a mile. Its ruins are called *Gaib Aleth* in the British.

ALEXANDER AB ALEXANDRO, a Neapolitan lawyer, of great learning, who flourished toward the end of the 15th and beginning of the 16th century. He followed the profession of the law first at Naples, afterwards at Rome: but he devoted all the time he could spare to the study of polite literature; and at length he entirely left the bar, that he might lead a more easy and agreeable life with the muses. The particulars of his life are to be gathered from his work entitled *Genitium Dierum*. We are there informed, that he lodged at Rome,

in a house that was haunted; and he relates many surprising particulars about the ghost: he says also, that, when he was very young, he went to the lectures of Philephus, who explained at Rome the Tusculan questions of Cicero; he was there also when Nicholas Perot and Domitius Calderinus read their lectures upon Martial. The particular time when he died is not known; but he was buried in the monastery of the Olivets. Tiraquea wrote a learned commentary upon his work, which was printed at Lyons in 1587, and reprinted at Leyden in 1673, with the notes of Dennis Godfrey, Christopher Colerus, and Nicholas Marcerus.

ALEXANDER SEVERUS, emperor of Rome, succeeded Heliogabalus about A.D. 222, when but 16 years of age. His mother's name was Mammaea, and by her advice he in a great measure regulated his conduct. He applied himself to the reformation of abuses, the state having been greatly disordered by the vicious conduct of his predecessor; he was a most strict lover of justice, an encourager of learning and learned men, and favourable to the Christians. He made a successful expedition against the Persians; but endeavouring to reform his troops, who had grown very licentious under the late bad government, they murdered him, at the instigation of Maximinus, in the 29th year of his age, together with his mother, A.D. 235.

ALEXANDER VI. (Pope), had four bastards when he was cardinal, for one of whom he had so great affection that he stuck at nothing to raise him. Desiring to poison some cardinals, he was poisoned himself, A.D. 1503. See *BORGIA*.

ALEXANDER VII. (Pope), whose real name was Fabio Chigi, was born at Sienna in 1599. His family finding him a hopeful youth, sent him early to Rome, where he soon engaged in a friendship with the Marquis Pallavicini, who recommended him so effectually to Pope Urban VIII. that he procured him the post of Inquisitor at Malta. He was sent vice-legate to Ferrara, and afterward nuncio into Germany: there he had an opportunity of displaying his intriguing genius; for he was mediator at Munster, in the long conference held to conclude a peace with Spain. Cardinal Mazarin had some resentment against Chigi, who was soon after made a cardinal and secretary of state by Innocent X. but his resentment was sacrificed to political views. In 1655, when a pope was to be chosen, Cardinal Sacchetti, Mazarin's great friend, finding it was impossible for him to be raised into St. Peter's chair because of the powerful opposition made by the Spanish faction, desired Cardinal Mazarin to consent to Chigi's exaltation. His request was granted, and he was elected pope by the votes of all the 64 cardinals who were in the conclave: an unanimity of which there are but few instances in the election of popes. He shewed uncommon humility at his election, and at first forbade all his relations to come to Rome without his leave; but he soon became more favourable to his nephews, and loaded them with favours. It is asserted that he had once a mind to turn Protestant. The news-papers in Holland bestowed great encomiums upon him; and acquainted the world, that he did not approve of the cruel persecutions of the Waldenses in Piedmont. There is a volume of his poems extant. He loved the *Belles-Lettres*, and the conversation of learned men. He was extremely fond of stately buildings; the grand plan of the college *Della Sapienza*, which he finished, and adorned with a fine library, remains a proof of his taste in architecture. He died in 1667.

ALEXANDER (William), earl of Stirling, an eminent Scots statesman and poet in the reigns of James I. and Charles I. who, after travelling with the duke of Argyll as his tutor or companion, wrote a poetical complaint of his unsuccessful love

of some beauty, under the title of *Aurora*. He then removed to the court of James VI. where he applied to the more solid parts of poetry, forming himself upon the plan of the Greek and Roman tragedians. In 1607 he published some dramatic performances, entitled *The Monarchie Tragedies*, dedicated to King James; who was so well pleased with them, as to call him his philosophical poet. After this, he is said to have written *A Supplement* to complete the third part of Sir Philip Sidney's *Arcadia*; and in 1613 he produced a poem called *Doomsday, or the great Day of Judgment*. He was made gentleman-usher to Prince Charles, and master of the requests; was knighted; and obtained a grant of Nova Scotia, where he projected the settlement of a colony, but afterward sold it to the French. In 1626 he was made secretary of state for Scotland; was created first viscount, and then earl, of Stirling; and died in 1640.

ALEXANDER (St.), whom St. Irenæus reckons the fifth bishop of Rome, succeeded St. Evaristus in the year 109, and died in the year 119. There is no account of his life; and the epistles which are attributed to him are supposititious.

ALEXANDER II. king of Scotland, succeeded his father William in 1213, at 16 years of age. He made an expedition into England, to oppose the tyranny of King John; who returned the visit, and was offered battle by Alexander, but refused it. He took the city of Carlisle from Henry III. which was afterwards exchanged for Berwick. Alexander died in 1249, in the 51st year of his age, and 35th of his reign; and left for his successor, his son.

ALEXANDER III. who was crowned king of Scotland in 1249. The Cummings, lords of Scotland, took arms against him; and taking him prisoner, confined him at Striveling; but he was afterwards released by his subjects. He married the daughter of Henry III. king of England; and was at length killed by a fall from his horse, on the 10th of April, 1290, after having reigned forty-two, or according to others thirty-seven, years.

ALEXANDREA (anc. geog.), a mountain of Myfia, on the sea-coast, forming a part of mount Ida, where Paris gave judgment on the three goddesses.

ALEXANDRETTA (Encycl.), is the port of Aleppo, from which it is distant twenty-eight or thirty leagues. It is now little else but a heap of ruined houses, chiefly inhabited by Greeks, who keep tippling-houses for sailors. The air is very unwholesome; and therefore the better sort of inhabitants, during the hot weather, live at a village called *Bayland*, on a mountain about ten miles off, where there is wholesome water and excellent fruit. What surprises strangers most, when they arrive at this place, are the pigeons which carry letters to Aleppo, which they reach in about three hours: these pigeons are of a singular kind, and are very much celebrated throughout the East.

ALEXANDRIA, (anc. geog.), a city of Arachosia, called also *Alexandropolis*, on the river Arachotus (Stephanus, Isidorus Characenus).—Another *Alexandria* in Gedrosia, built by Leonatus, by order of Alexander (Pliny).—A third *Alexandria* in Aria, situated at the lake Arias (Ptolemy); but, according to Pliny, built by Alexander on the river Aris.—A fourth in the Bactriana (Pliny).—A fifth *Alexandria*, an inland town of Carmania (Pliny, Ptolemy, Ammian).—A sixth *Alexandria*, or *Alexandropolis*, in the Sogdiana (Isidorus Characenus).—A seventh in India, at the confluence of the Acesines and Indus (Arrian).—An eighth, called also *Alexandretta*, near the Sinus Ificus, on the confines of Syria and Cilicia, now *Scanderoon*, the port-town to Aleppo.—A ninth *Alexandria* of Margiana, which being demolished by the barbarians, was rebuilt by Antiochus the son of Seleucus, and called *Antiochia* of Syria (Pliny); watered by the river Margus, which is divided into

several channels, for the purposes of watering the country, which was called *Zotale*. The city was seventy stadia in circuit, according to Pliny; who adds, that, after the defeat of Crassus, the captives were conveyed to this place by Orodes, the king of the Parthians.—A tenth, of the Oxianna, built on the Oxus by Alexander, on the confines of Bactria (Pliny).—An eleventh, built by Alexander at the foot of mount Paropamisus, which was called *Caucasus* (Pliny, Arrian).—A twelfth *Alexandria* in Troas, called also *Troas* and *Antigonía* (Pliny).—A thirteenth, on the laxartes, the boundary of Alexander's victories towards Scythia, and the last that he built on that side.

ALEYN (Charles), an English poet in the reign of Charles I. In 1631 he published two poems on the famous victories of Creci and Poitiers. He succeeded his father as clerk of the ordinance, and was commissary-general of the artillery to the king at the battle of Edgehill. The next piece he wrote was a poem in honour of Henry VII. and the victory that gained him the crown of England. In 1639, the year before he died, he translated the history of Eutalius and Lucretia, from the Latin epistles of Aeneas Sylvius.

ALFACKS, the name of certain islands near the mouth of the Ebro, in the principality of Catalonia, in Spain.

ALFATERNA (anc. geog.), the last town of Campania, beyond Vesuvius (Diodorus); the fame with *Nuceria*, which see. The inhabitants *Alfaterni* (Pliny).

ALFEIZERAO, a small town of Estramadura, in Portugal, on the sea-side. Long. 9. 10. W. Lat. 39. 30. N.

ALFELD, a town of Germany, in the bishopric of Hildesheim, fifteen miles S. S. W. of Hildesheim. Long. 10. 4. E. Lat. 51. 58. N.

ALFIDENA, an ancient town of the kingdom of Naples, and in Abruzzo Ceteriore. Long. 14. 20. E. Lat. 41. 48. N.

ALFRED (Encycl.). This prince, we are told, was twelve years of age before a master could be procured in the western kingdom to teach him the alphabet; such was the state of learning when Alfred began to reign. He had felt the misery of ignorance; and determined even to rival his contemporary Charlemagne in the encouragement of literature. He is supposed to have appointed persons to read lectures at Oxford, and is thence considered as the founder of that university. By other proper establishments, and by a general encouragement to men of abilities, he did every thing in his power to diffuse knowledge throughout his dominions. Nor was this end promoted more by his countenance and encouragement, than by his own example and his writings. For notwithstanding the lateness of his initiation, he had acquired extraordinary erudition; and, had he not been illustrious as a king, he would have been famous as an author. His works are, 1. *Breviarium quoddam collectum ex Legibus Trojanorum*, lib. I. A Breviary collected out of the Laws of the Trojans, Greeks, Britons, Saxons, and Danes; in one book. Leland saw this book in the Saxon tongue, at Christ-church in Hampshire. 2. *Viji-Saxonum Leges*, lib. I. The Laws of the West-Saxons, in one book. Pitts tells us, that it is in Bennet College library, at Cambridge. 3. *Instituta quorundam*, lib. I. Certain Institutes, in one book. This is mentioned by Pitts, and seems to be the second capitulation with Guthrum. 4. *Contra Judices iniquos*, lib. I. An Inveictive against Unjust Judges, in one book. 5. *Acta Magistratum suorum*, lib. I. Acts of his Magistrates, in one book. This is supposed to be the book of judgments mentioned by Horne; and was, in all probability, a kind of reports, intended for the use of succeeding ages. 6. *Begum Fortune varie*, lib. I. The various Fortunes of Kings, in one book. 7. *Dicta Sapientum*, lib. I. The Sayings of Wise Men, in one book. 8. *Parabole et Sales*, lib. I. Parables and pleasant Sayings, in one book. 9. Col-

Isidore Chronicorum. Collections of Chronicles. 10. *Epistole ad Wulfstann Episcopum*, lib. I. Epistles to Bishop Wulfstann, in one book. 11. *Manuale Meditationum.* A Manual of Meditations.—Besides these original works, he translated many authors from the Latin, &c. into the Saxon language, viz. 1. Bede's History of England, 2. Paulinus Orosius's History of the Pagans, 3. St. Gregory's Pastoral, &c. The first of these, with his prefaces to the others, together with his laws, were printed at Cambridge, 1644. His laws are likewise inserted in Spelman's Concils. 4. *Boetius de Consolatione*, lib. V. Boetius's Consolations of Philosophy, in five books. Dr. Plott tells us, King Alfred translated it at Woodstock, as he found in a MS. in the Cotton Library. 5. *Ætoliæ Fabulæ.* Ætoli's Fables: which he is said to have translated from the Greek into Latin and Saxon. 6. *Psalterium Davidicum*, lib. I. David's Psalter, in one book. This was the last work the king attempted, death surprising him before he had finished it; it was however completed by another hand, and published at London in 1640, in quarto, by Sir John Spelman. Several others are mentioned by Mahnsbury; and the old History of Ely asserts, that he translated the Old and New Testaments.

The life of this great king was first written by Asferius Menevius; and first published by Archbishop Parker, in the old Saxon character, at the end of his edition of Hastingham's history, printed in 1674, fol.

ALLAHABAD, a city of Oude, in Hindoostan Proper, seated at the point of the confluence of the two great rivers, the Ganges and Jumna. It was founded by the emperor Acbar, who intended it as a place of arms. It belongs to the Nabob of Oude; but its fortifications will hardly resist the battering of a field piece. It is 470 miles north-west of Calcutta: Long. 82. o. E. Lat. 25. 45. N.

ALLATIUS (Leo), keeper of the Vatican library, a native of Scio, and a celebrated writer of the 17th century. He was of great service to the gentlemen of Port Royal in the controversy they had with M. Claude touching the belief of the Greeks with regard to the eucharist. No Latin was ever more devoted to the see of Rome, nor more inveterate against the Greek schismatics, than Allatius. He never engaged in matrimony, nor was he ever in orders; and Pope Alexander VII. having asked him one day, why he did not enter into orders, he answered, "Because I would be free to marry." The Pope rejoined, "If so, why do you not marry?" "Because," replied Allatius, "I would be at liberty to take orders." Thus, as Mr. Bayle observes, he passed his whole life, wavering betwixt a parish and a wife; sorry, perhaps, at his death, for having chosen neither of them; when, if he had fixed upon one, he might have repented his choice for thirty or forty years.—If we believe John Patricius, Allatius had a very extraordinary pen, with which, and no other, he wrote Greek for forty years; and we need not be surprised, that when he lost it, he was so grieved, that he could scarce forbear crying. He published several manuscripts, several translations of Greek authors, and several pieces of his own composing. In his compositions he is thought to shew more erudition than judgment: he used also to make frequent digressions from one subject to another. He died at Rome in 1669, aged eighty-three.

ALLEGANY, or APPALACHIAN MOUNTAINS, the general name of a long range of mountains in North America, between the Atlantic, the Mississippi, and the Lakes. They extend north-easterly and south-westerly, nearly parallel with the sea-coast, about 900 miles in length, and from 60 to 200 in breadth. The different ridges which compose this immense range have different names in the different states. Advancing from the Atlantic, the first ridge in Pennsylvania, Virginia, and North Carolina, is the Blue Ridge, or South Mountain,

from 130 to 200 miles from the sea, and about 4000 feet high from its base. Between this and the North Mountain, spreads a large fertile vale. Next lies the Allegany, which is the principal ridge, and has been descriptively called the *back-bone* of the United States. Beyond this is the long ridge called the Laurel Mountains; in a spur of which, in lat 36°, is a spring of water, fifty feet deep, very cold, and as blue as indigo. From these several ridges proceed innumerable nameless branches or spurs. The Kittatiny, or Blue Mountains, run through the northern parts of New Jersey and Pennsylvania. The general name for these mountains seems not yet to have been determined. Mr. Evans, an American geographer, calls them the Endless Mountains: others have called them the Appalachian, from a tribe of Indians, who live on a river proceeding from the ridge, called the Appalachikola. But the most common, and, no doubt, the most proper name, is the Allegany Mountains, so called from the principal ridge. These mountains are not confusedly scattered and broken, rising here and there into high peaks over-topping each other, but stretch along in uniform ridges, scarcely half a mile high. They spread as we proceed south, and some of them terminate in high perpendicular bluffs. Others gradually subside into a level country, giving rise to the rivers which run southerly into the gulf of Mexico. In the back parts of Pennsylvania, scarcely one acre in ten in this range is capable of culture; but this is not the case in all parts; for numerous tracts of fine arable and pasture land intervene between the ridges, having generally a rich black soil. Indeed, some of the mountains will admit of cultivation almost to their tops.

ALLCHURCH, a village of Warwickshire, once seven miles in circumference. The Roman Ickneld-street passes through it. This village was formerly a borough, and had a market, and several streets, the names of which are now lost. The bishop of Worcester had formerly a palace here; and the church, several parts of which are of Saxon architecture, contains many antique monuments. It is five miles from Bromsgrove, in the road to Leicester.

ALLEGRAZZA, a small island of Africa, and one of the Canaries, lying to the north of Graciosa, to the north-west of Rocca, and to the east of St. Clase. There are several castles that defend the harbour.

ALLEIN (Joseph), the son of Tobias Allein, was born in the Devises in Wiltshire, in 1633, and educated at Oxford. In 1655 he became assistant to Mr. Newton, in Taunton-Magdalen in Somersetshire; but was deprived for non-conformity. He died in 1668, aged thirty-five. He was a man of great learning, and greater charity; preserving, though a nonconformist and a severe sufferer on that account, great respect for the church, and loyalty to his sovereign. He wrote several books of piety, which are highly esteemed; but his *Alarm to unconverted Sinners* is more famous than the rest. There have been many editions of this little pious work, the sale of which has been very great; of the edition 1672, there were 20,000 sold; of that 1675, with this title, *A Sure Guide to Heaven*, 50,000. There was also a large impression of it with its first title, in 1720.

ALLEN (Thomas), a famous mathematician of the 16th century, born at Uttoxeter in Staffordshire, the 21st of December, 1542. He was admitted scholar of Trinity College, Oxford, the 4th of June, 1561; and in 1567 took his degree of master of arts. In 1570 he quitted his college and fellowship, and retired to Gloucester-hall; where he studied very closely, and became famous for his knowledge in antiquity, philosophy, and mathematics. Having received an invitation from Henry earl of Northumberland, a great friend and patron of the mathematicians, he spent some time at the earl's house, where he became acquainted with those celebrated ma-

thematicians Thomas Harriot, John Dee, Walter Warner, and Nathaniel Torporley. Robert earl of Leicester had a particular esteem for Mr. Allen, and would have conferred a bishopric upon him, but his love of solitude and retirement made him decline the offer. His great skill in the mathematics, made the ignorant and vulgar look upon him as a magician or conjurer: the author of a book entitled *Leicester's Commonwealth*, has accordingly accused him with using the art of figuring, to procure the Earl of Leicester's unlawful designs, and endeavouring by the black art to bring about a match between him and Queen Elizabeth. But without pretending to point out the absurdity of the charge, it is certain that the earl placed such confidence in Allen, that nothing material in the state was transacted without his knowledge; and the earl had constant information, by letter, from Mr. Allen, of what passed in the university. Mr. Allen was very curious and indefatigable in collecting scattered manuscripts relating to history, antiquity, astronomy, philosophy, and mathematics: these collections have been quoted by several learned authors, &c. and mentioned to have been in the Bibliotheca Alleniana. He published in Latin the second and third books of Claudius Ptolemy of Pelsium, *Concerning the Judgment of the Stars*, or, as it is commonly called, of the *Quadruplicate Construction*, with an exposition. He wrote also notes on many of Lilly's books, and some on John Bale's work *De Scriptoribus Maj. Britannie*. Having lived to a great age, he died at Gloucester-hall, on the 30th of September, 1632.

ALLEN, a small river of Flintshire in North Wales, which sinks under ground, near Mold, and is lost for a short space.

ALLERIA, a decayed town in Corsica, a bishop's see, and the place where King Theodore first landed in 1736. Long. 8. 50. E. Lat. 42. 5. N.

ALLESTRY (Richard), D.D. an eminent divine, born at Uppington in Shropshire, in March 1610, was educated in the grammar school at Coventry, and afterwards at Christ-church in Oxford. His parts, which were extraordinary, were improved by a no less extraordinary industry. He took up arms for King Charles I. and was sometimes seen with his musket in one hand and his book in the other. He was very active in the service of King Charles II. before his restoration, and was employed by the royalists in transacting business with that prince during his exile; but was at last seized at Dover by a party of soldiers, and committed prisoner to Lambeth-house, where he was confined six or eight weeks: but soon after the restoration he was made canon of Christ-church, created doctor of divinity, and appointed chaplain in ordinary to the king, and regius professor of divinity. In 1665 he was appointed provost of Eton College, where he raised the school, which he found in a low condition, to an uncommon pitch of reputation. The west side of the outward quadrangle of that college was built from the ground at his expence. The excellent Dr. Hammond, who was his intimate friend, left him his valuable library, which he himself afterwards bequeathed to his successors in the divinity-chair. He was eminent for his piety, benevolence, and integrity; for the sincerity of his friendship, and his disinterested temper. He wrote several books; and a collection of his sermons were printed after his decease, by Dr. Fell, bishop of Oxford. He died August 28, 1680.

ALLEY (William), bishop of Exeter in the reign of Queen Elizabeth, was born at Great Wycomb in Buckinghamshire. From Eton school, in the year 1528, he removed to King's College, Cambridge, where he took the degree of bachelor of arts. He also studied some time at Oxford; afterwards he married, was presented to a living, and became a zealous reformer. Upon Queen Mary's accession, he left his cure, and

retired into the north of England; where he maintained his wife and himself by teaching a school, and practising physic. Queen Elizabeth ascending the throne, he went to London, where he acquired great reputation by reading the divinity-lecture at St. Paul's, and in July, 1560 was consecrated bishop of Exeter. He was created doctor of divinity at Oxford in November 1561. He died on the 15th of April, 1570; and was buried at Exeter, in the cathedral. He wrote, 1. *The poor Man's Library*, 2 vols. fol. London, 1571. These volumes contain twelve lectures on the first epistle of St. Peter, read at St. Paul's. 2. *A Hebrew Grammar*. Whether it was ever published; is uncertain. He translated the Pentateuch in the version of the Bible which was undertaken by Queen Elizabeth's command.

ALLIA (*Enycl.*), was famous for the great slaughter of the Romans by the Gauls, under Brennus: hence *Allienis dies*, an unlucky day (Virgil, Ovid, Lucan). Our ancestors, says Cicero, deemed the day of the fight of *Allia*, more fatal than that of taking the city.

ALLIER, a department of France (lately the province of Bourbonnois), is called from a river which flows by Moulins, and falls into the Loire above Orleans.

ALLOBROGES, (Inscriptions, Livy, Velleius, Florus); from *Allobrox* (Horace): a people of Gallia Narbonensis, situated between the rivers Iara and Rhodanus, and the Lacus Lemannus; commended by Cicero for their fidelity, discommended by Horace on account of their fondness for novelty.

ALMARIC, HERESY of, a tenet broached in France by one Almaric, in the year 1209. It consisted in affirming, that every Christian was actually a member of Christ; and that without this faith no one could be saved. His followers went farther, and affirmed, that the power of the father lasted only during the continuance of the Mosaic law; that the coming of Christ introduced a new law; that at the end of this began the reign of the Holy Ghost; and that now confession and the sacraments were at an end, and that every one is to be saved by the internal operations of the Holy Spirit alone, without any external act of religion.

ALMENDVALAIO, a town of Estramadura in Spain, near the borders of Portugal. Long. 5. 6. W. Lat. 38. 36. N.

ALMIGGIM-WOOD (Scripture), is thought to be that of the Indian pine-tree; which being light and white, was greatly esteemed for making musical instruments.

ALMONRY (*Enycl.*). In this article, vol. I. p. 124, correct an error, affecting the sense; by substituting the words "were distributed," in place of "are given."

ALOE (*Enycl.*), in botany. Of this genus of plants, some botanical writers enumerate ten, but others extend the number to twenty-three, species. One of them, named in our first volume, the *margaritifera*, or pearl aloe, deserves more particular mention. This very beautiful plant is smaller than most of the aloe kind. The leaves are short, very thick, sharp pointed, and turning down, with a large thick end, appear there triangular. The colour of the leaves is a fine green, striped in an elegant manner with white, and frequently tipped with red at the point. The flower-stalk, which rises in the midst of the leaves, is round, smooth, of a purple colour, and generally about eight inches high. When the plant has been properly cultivated, the flowers are striped with green and white; and sometimes they are entirely white. This aloe is singular in not having the bitter resinous juice with which the leaves of most others abound; when a leaf of this species is cut, what runs from it is watery, colourless, and perfectly insipid. See a figure of it in Pl. 13.

ALPHEUS (*Enycl.*). This river has a common spring with the Eurotas, at the foot of mount Parthenion, near the

village Afea (Strabo). The Alpheus and Eurotes mix and run together for twenty stadia; after which, they enter a subterraneous passage at Mantinea; then again emerge, the Eurotas in Laconica, and the Alpheus in the territory of Megalopolis (Pausanias). The poets fable strange things of this river; particularly, that, out of love to the nymph *Arethusa*, it runs under the sea to Sicily, and bursts out at the fountain of that name in Syracuse (Virgil). Its waters were reckoned good in the leprosy, which is called *Δαρυς*, by the Greeks; and hence the name *Alpheus*.—Pausanias adds, that the Eleans had a law, which condemned any woman to death that should either appear at the Olympic games, or even cross this river during that solemnity: and the Eleans add, that the only woman who transgressed it, had disguised herself in the habit of a master or keeper of these games, and conducted her son thither; but when she saw him come off victorious, her joy made her forget her disguise, so that her sex was discovered. She was pardoned, but from that time a law was made that the keepers should appear there naked.

ALPHONSUS X. king of Leon and Castile, furnished the Wife, was author of the astronomical tables called *Alphonfine*. Reading of Quintus Curtius gave him such delight, that it recovered him out of a dangerous illness. He read the Bible fourteen times, with several comments on it. He is said to have found fault with the structure of the mundane system, and has been charged with impiety on that score; but unjustly, for he only found fault with the involved system of some astronomers. He was dethroned by his son Sancho; and died of grief, A.D. 1284.

ALPINI (Prospero), (*Encycl.*), wrote the following works in Latin: 1. Of the phycic of the Egyptians, in four books. Printed at Venice, 1592, in 4to. 2. A treatise concerning the plants of Egypt. Printed at Venice, 1592, in 4to. 3. A dialogue concerning balsams. Printed at Venice, 1592, in 4to. 4. Seven books concerning the method of forming a judgment of the life or death of patients. Printed at Venice, 1691, in 4to. 5. Thirteen books concerning methodical Phycic. Padua, 1611, folio; Leyden, 1719, in 4to. 6. A Disputation held in the school at Padua, concerning the Raphonticum. Padua, 1612, and 1629, 4to. 7. Of exotic plants, in two books. Venice, 1699, in 4to. He left several other works, which have never been printed; particularly, 8. The fifth book concerning the phycic of the Egyptians. 9. Five books concerning the natural history of things observed in Egypt, adorned with a variety of draughts of plants, fishes, and animals.

ALFREDUS, ALURED, or ALFREDUS (*Encycl.*). It is generally believed that this historian was educated at Cambridge, and that he afterwards became one of the canons and treasurer of St. John's at Beverley. And we learn in a note of Bishop Tanner's, that, for the sake of improvement, he travelled through France and Italy; and that at Rome he became domestic chaplain to Cardinal Othoboni. He died in the year 1128, or 1129; leaving behind him the following works: 1. *The Annals of Alured of Beverley*. Oxford, 1726. Published by Mr. Hearne, from a manuscript belonging to Thomas Rawlinson, esq. It contains an abridgment of our history from Brutus to Henry I. written in good Latin, and with great accuracy. 2. *Libertates ecclesie S. Johannis de Beverlac*, &c. a manuscript in the Cotton library. It is a collection of records relative to the church at Beverley, translated by our author from the Saxon language. The *Biographia Britannica* evidently proves these to be all that were written by Aluredus.

ALSIUM (*Encycl.*), a city of ancient Etruria. We are told by Dionysius Halicarnassensis, that Alsium was built by the aborigines, long before the Tyrrhenians invaded Italy. In Vol. X.

this case it must have been founded not long after the dispersion in the days of Peleg. Its founder is said to have been one *Alafus*, *Alfus*, or *Alfa*; whom some conjecture to have been Alifiah, or Elifha, the son of Javan, mentioned in Scripture.

ALSTEDIUS (John Henry), a German Protestant divine, and one of the most indefatigable writers of the 17th century. He was some time professor of philosophy and divinity at Herborn in the county of Nassau: from thence he went into Transylvania, to be professor at Alba Julia; where he continued till his death, which happened in 1638, being then fifty years of age. His *Encyclopædia* has been much esteemed even by the Roman-catholics; it was printed at Lyons, and sold very well throughout all France. His *Thesaurus Chronologicus* is by some esteemed one of his best works, and has gone through several editions. He also wrote *Triumphus Biblicus*, to shew that the principles of all arts and sciences are to be found in the Scriptures; but he gained very few to his opinion. He was a Milenarian; and published, in 1627, a treatise *De mille annis*, in which he asserted that the reign of the saints on earth was to begin in 1694.

ALTAR (*Encycl.*). Before temples were in use, altars were erected sometimes in groves, sometimes in the highways, and sometimes on the tops of mountains; and it was a custom to engrave upon them the name, ensign, or character, of the deity to whom they were consecrated.

In the great temples of ancient Rome, there were ordinarily three altars: the first was placed in the sanctuary, at the foot of the statue of the divinity, upon which incense was burnt and libations offered; the second was before the gate of the temple, and upon it they sacrificed the victims; and the third was a portable altar, upon which were placed the offering and the sacred vessels.

Besides these uses of altars, the ancients swore upon them, and swore by them, in making alliances, confirming treaties of peace, and other solemn occasions. Altars also served as places of refuge to all those who fled to them, whatever crime they had committed.

Among the Jews, altars in the patriarchal times were very rude. The altar which Jacob set up at Beth-el was nothing but a stone, which served him instead of a bolster; that of Gideon, a stone before his house: and the first which God commanded Moses to erect was probably of earth, or unpolished stones, without any iron; for if any use was made of that metal, the altar was declared impure.

The principal altars of the Jews were, The altar of incense; that of burnt-offering; and the altar, or table, for the shew-bread.

The altar of incense was a small table of shittim-wood, covered with plates of gold, of one cubit in length, another in width, and two in height. At the four corners, were four kinds of horns, and all round a little border or crown over it. This was the altar hidden by Jeremiah before the captivity; and upon it the officiating priest offered, every morning and evening, incense of a particular composition. See Pl. 13.

The altar of burnt-offerings was made of Shittim-wood, and carried upon the shoulders of the priests by staves of the same wood overlaid with brass. In the time of Moses, this altar was five cubits square, and three high; but in Solomon's temple it was much larger, being twenty cubits square, and ten in height. It was covered with brass; and at each corner was a horn or spire, wrought out of the same wood with the altar to which the sacrifices were tied. Within the hollow was a grate of brass, on which the fire was made; through it fell the ashes, and were received in a pan below. At the four corners of the grate were four rings and four chains, which

kept it up at the horns. This altar was placed in the open air, that the smoke of the burnt-offerings might not fully the inside of the tabernacle. See the Plate.

The altar, or table for the *five-bread*, was likewise of flint-wood, covered with plates of gold, having a little border round it, adorned with sculpture. It was two cubits long, one wide, and one and an half in height. Upon this table, which stood in the holy of holies, were put, every sabbath-day, twelve loaves, with salt and incense.

The Jewish altars, after their return from the captivity, and the building of the second temple, were in some respects different from those described above. That of burnt-offerings was a large pile, built of unhewn stone, thirty-two cubits square at the bottom, and twenty-four square at the top. The ascent was by a gentle rising, thirty-two cubits in length, and sixteen in breadth.

ALTESSON, a town of Piedmont, between the rivers Dore and Stura, two miles E. of Louvenire. Long. 7. 20. E. Lat. 44. 36. N.

ALTEZBY, a town and castle of Germany, in the Lower Palatinate, capital of a territory of the same name, fifteen miles S.W. of Mentz. Long. 8. 12. E. Lat. 49. 40. N.

ALTIN (*Encycl.*). This lake is called by the Russians *Telesnoi Ozero*, from the Teleffi, a Tartarian nation, who inhabit the borders of it, and who give it the name of *Altin-Kul*. By the Calmucks it is called *Altinor*. It is near ninety miles long and fifty broad, with a rocky bottom. The north part of it is sometimes frozen so hard as to be passable on foot, but the southern part it never covered with ice. The water in the Altin lake, as well as in the rivers which run through the adjacent places, only rises in the middle of summer, when the snows on the mountains are melted by the heat of the sun.

ALTING (Henry), professor of divinity at Heidelberg and Groningen, born at Emden, Feb. 17, 1583, of a family which had been long conspicuous in Friseland. His father, Meno Alting, was the first, who, with two others, preached the reformation in the territory of Groningen, about the year 1566, under the tyrannical government of the Duke of Alva; and the first that preached in the great church of Groningen, after the reduction of that town by the States General in 1594. Henry was chosen, in 1605, preceptor to the three young counts of Nassau, Solms, and Izenberg. After various difficulties, he settled at Groningen, where he continued till his death, August 25, 1644. He was a sound protestant divine, a pious Christian, an useful member of society in many respects, and one who suffered much for the truth. Most of his works were never published; those which have been, are the following: *Nota in decadem problematum J. Behm*, 1613. *Loci communes explicatio catecheseos Palatine*, 1646, in 3 vols. *Exegetici Augustinæ confes.* 1647. *Methodus theologice*, 1650. It appears from the catalogue of his works annexed to his life, that the *Medulla hist. prophane*, published by D. Pareus, was composed by Alting. The most remarkable piece among Alting's MSS. is The ecclesiastical History of the Palatinate, from the Reformation to the Administration of John Casimir.

ALTING (James), son of the former, was born at Heidelberg, September 27, 1618. He travelled into England in 1640, where he was ordained by the learned Dr. Prideaux, bishop of Worcester. He afterwards accepted of the professorship of Groningen, vacant by the death of Gomarus; but his situation was rendered very disagreeable by the continual disputes which he had with his colleague Sam. des Marets, who favoured the school-divinity. He made a pious exit, August 20, 1679, recommending the edition of his works to Meno Alting (author of *Notitia German. Infer. Antiquæ*, fol. Amst. 1697); but they were published in 5 vols. folio, with

his life, by Mr. Bekker of Amsterdam. They contain various analytical, exegetical, practical, problematical, and philosophical tracts, which shew his great industry and knowledge. Alting was a divine greatly addicted to the text of the scripture, to Cocceianism, and Rabbinism. He preached well in German, Dutch, and English.

ALTKIRCH, a town of France, in the department of the Upper Rhine and late province of Alsace, on the river Ille, forty-five miles S. S. W. of Strasbourg. Long. 7. 20. E. Lat. 47. 40. N.

ALTORF, a town of Germany, in the circle of Suabia, twenty miles N.E. of Constance, and subject to the house of Austria. Long. 9. 30. E. Lat. 47. 50. N.

ALTORP, a town of Switzerland, capital of the canton of Uri, on the lake of Lucern, near the spot where it receives the river Reufs, twenty miles S. E. of Lucern. Long. 8. 25. E. Lat. 46. 55. N.

ALVARISTS, in ecclesiastical history, a branch of the Thomists, so called from Alvarez, their leader, who ascribed the doctrine of sufficient grace, instead of the efficacious grace of the ancient Thomists. The Alvarists come near to the Jesuits, the ancient Thomists to the Jansenists.

ALVESTON, a village of Gloucestershire. On the top of a hill near the Severn, is a large round camp, called Oldbury, where several antiquities have been dug up. It is eight miles from Bristol.

ALUNTIUM, ALONTIUM (anc. geog.), a town in the north of Sicily, situated on a steep eminence, at the mouth of the Chydus (Ptolemy, Pliny, Cicero); said to be as old as the war of Troy (Dionys. Halicarn.). Now in ruins; from which arose the hamlet *St. Filadelfo*, in the Val di Demona. The inhabitants were called *Habintini* (Cicero).

AMADMAGDA, an Abyssinian plant, said to be used by the inhabitants of that country for facilitating the consolidation of fractures, and the discharge of bony splinters from wounds.

AMALEKITES, by some thought to be the descendants of Amalek the grandson of Esau; by others, with more probability, to have been a Canaanitish tribe. They were a wicked people, and therefore devoted to destruction. They lived to the east of the Lacus Asphaltites; next the Moabites to the south, and the Ammonites to the north. A branch of them dwelt to the south of Canaan.

AMALTHEA, the name of the Cumesan Sibyl, who offered to Tarquinus Superbus nine books, containing the Roman destinies, and demanded 300 pieces of gold for them. He derided her, whereupon she threw three of them into the fire; and returning, asked the same price for the other six; which being denied, she burnt three more; and returned, still demanding the same price. Upon which, Tarquin consulting the pontiffs, was advised to buy them. These books were in such esteem, that two magistrates were created to consult them upon extraordinary occasions.

AMALTHEA, in pagan mythology, the daughter of Melissus king of Crete, and the nurse of Jupiter, whom she fed with goats' milk and honey. According to others, Amalthea was a goat, which Jupiter translated into the sky, with her two kids, and gave one of her horns to the daughters of Melissus, as a reward for the pains they had taken in attending him. This horn had the peculiar property of furnishing them with whatever they wished for, and was thence called the *cornucopia*, or horn of plenty.

AMALTHÆUS (Jerome, John Baptista, and Cornelle), three celebrated Latin poets of Italy, who flourished in the 16th century. Their compositions were printed at Amsterdam in 1685. One of the prettiest pieces in that collection is an epigram on two children, whose beauty was

very extraordinary, though each of them was deprived of an eye :

‘Lumine Acon dextro, capta est Leonilla sinistro :

‘Et poterat forma vincere uterque deos.

‘Parve puer; lumen quod habes concede forori ;

‘Sic tu cæcus Amor, sic erit illa Venus.’

AMARA (Sixtinus), professor of the Hebrew tongue in the university of Franeker, a man of great learning, was born in Friedland, and had studied under Drusus. He published a criticism upon the translation of the Pentateuch ; collated the Dutch translation of the bible with the original and the most accurate translations ; and wrote a censure of the Vulgate translation of the historical books of the Old Testament, Job, the Psalms, and Canticles. It is impossible to answer the reasons whereby he shews the necessity of consulting the originals. This he recommended so earnestly, that some synods, being influenced by his reasons, decreed, that none should be admitted into the ministry but such as had a competent knowledge of the Hebrew and Greek text of the Scripture. He died in 1629.

AMAND (St.) (*Encycl.*), a city of France in the department of Cher, and late province of Bourbonnois. It was built in 1410 on the ruins of Orval.

AMAND (St.) (*Encycl.*), a town of France, in the department of the North, and in the late French Flanders. It had lately a celebrated abbey. When the combined forces of Prussia and Austria invaded France in 1792, it was taken by them, but evacuated afterward on their memorable retreat. It is seated on the river Scarpe, seven miles N. of Valenciennes.

AMANICÆ PYLÆ (Ptolemy.) ; **AMANIDES PYLÆ**, (Strabo) ; **AMANI PORTÆ** (Pliny) ; straits or defiles in mount Amanus, through which Darius entered Cilicia ; at a greater distance from the sea than the Pylæ Ciliciæ or Syriæ, through which Alexander passed.

AMARYNTHUS (anc. geog.), a hamlet of Eretrias, in the island of Eubæa, about seven stadia distant from its walls (Strabo). Here Diana was worshipped by an annual solemnity, at which those of Carytus assisted ; hence the title of the goddess was *Amarynthis*, and *Amarysia* (Livy, Pausanias).

AMATHUS (*Encycl.*), a town so called, from Amanthus the founder : or, according to others, from *Amath*, a Phœnician town sacred to Venus, with a very ancient temple of Adonis, and Venus ; and hence Venus is denominated *Amathusia* (Tacitus). According to Ovid, it was a place rich in copper-ore, and where the inhabitants became *Cerysæa* or horned.

AMATHUS (Josephus), a town in the tribe of Gad, beyond Jordan ; but whether at a greater or less distance from it, is not so easy to determine. Eusebius places it in the Lower Peræa ; Roland in Ramoth-Gilead. Gabinus, proconsul of Syria, established five juridical conventions in Judea ; two of which were on the other side Jordan ; one on Galadra, the other at Amathus (Josephus).

AMAZONS (*Encycl.*) Those of Africa were female warriors, who were obliged to continue virgins to a certain period of their military service. When that period was elapsed, they married, merely with the view of propagating the species. All the offices of state were filled by them. The men were employed in domestic affairs, and passed their whole life in the house, as women did in other countries : for these imperious females usurped from them every function that might awake their valour. As soon as the Amazons were delivered, they committed their children to the care of the men, who nourished them with milk, and other food proper for infancy. If the child was a female, they burned its breasts to prevent their growth, which would have been inconvenient in battle.

Histrians inform us, that they inhabited an island which was called Heperia, because it lay to the west of the lake Tritonis.

AMAZONS (the river of), called by the Spaniards *Maranon*, is the greatest river in the world. It received the name of *Amazons*, because the Spaniards who first passed through the country on its banks, having some smart skirmishes with the natives, and afterwards examining the slain, found the bodies of some women among them. Orellana was the first who discovered this river, about the year 1539. The Maranon, after issuing from the lake from whence it takes its rise, in about eleven degrees of south latitude, runs towards the north to Jaen de Bracamoros, for the length of six degrees, from whence it directs its course towards the east, almost parallel to the equinoctial line, as far as the north cape, where it discharges itself into the ocean directly under the equator, by a mouth 50 or 60 leagues broad. It runs from Jaen, where it begins to be navigable, thirty degrees of longitude, according to Condamine, who was sent into these parts by the French king to discover the true measure of the earth. This is equal to 1800 miles of 60 to a degree. But if the turnings and windings are reckoned, it will then be at least 2700 miles. It receives from the north and south a prodigious number of rivers, some of which run 1500 miles, and are not inferior to the Danube or Nile. The country through which this river runs, is very little known to the Europeans.

AMBARVALIA (*Encycl.*). In this ceremony the prayer preferred, the formula of which we have in *Cato de Re Rustica*, cap. cxlii. was called *carmen ambarcale*. At these feasts they sacrificed to Ceres a sow, a sheep, and a bull or heifer, whence they took the name of *juvætaurilia*. The method of celebrating them, was to lead a victim round the fields, while the peasants accompanied it, and one of their number, crowned with oak, hymned forth the praises of Ceres, in verses composed on purpose. This festival was celebrated twice a-year ; at the end of January according to some, or in April, according to others ; and for the second time, in the month of July.

AMBER (*Encycl.*). To our original article concerning this substance, we wish to add a curious account of the preparation and use of a varnish of Amber, and its application to stained wood, published by Mr. NILS NYSTROM, of Norrköping, in Sweden, in the *Annales des Arts et Manufactures*. It is well known that stained woods require to be covered with a coat of varnish of amber, or of linseed oil, in order to deepen the colour, and render it susceptible of a bright polish the composition of these varnishes is therefore an object worthy our attention. The amber-varnish, as prepared in different places, is by no means uniform in its quality, whether owing to the negligence with which the melting of the amber is conducted, or to the manner in which the linseed oil is prepared, which becomes more or less inclined to dry in proportion to the degree of boiling which it has undergone. In order to ascertain the quality of such a varnish, it will be sufficient to apply it to any substance, and leave it for twelve or twenty-four hours to dry, in an apartment where the temperature is moderate : if in this space of time it becomes dry, we may consider it fit for use.

The best method of preparing it is the following : Put a quantity of amber, pounded and sifted, into a melting pan, so as to cover the bottom, which ought to be flat, to the height of an inch at most. Place this pan upon some support, whereby it may be kept in an exactly horizontal position, over a brisk fire of charcoal, which must be kept burning with as uniform a heat as possible, till the amber is melted, and become perfectly liquid ; the amber is then to be poured upon a plate of copper or brass, in order that it may suddenly cool. When the amber has cooled, it is to be broken into small pieces : and if

its fracture exhibits a very deep shining brown colour, not more than one half as bright as it was before its fusion, the amber will be fit for use.

A long course of experience has shewn that this circumstance cannot be too much attended to. In fact, if the amber has not been sufficiently melted, or if the fusion has been imperfect, it will not dissolve in the varnish; if, on the contrary, the operation has been performed with a heat too violent, and too long continued, it will be burnt, and quite unfit for use.

When amber is placed over too weak a fire, it does not melt, but forms a sort of deep brown incrustation, which may likewise be employed as a varnish, provided that it has not been too much evaporated. When it has lost about one half of its weight, it will be in the state most fit for use; if it has not been reduced to this weight, it must be put again into the melting pan, to bring it to the state required.

During the progress of the melting, it ought to be carefully scummed of all its impurities, from which, however, we may obtain a varnish of inferior quality.

For making varnish, it is not necessary to take the pure and transparent part of the amber; as our purpose may be answered by the small yellow fragments of inferior quality, which may be purchased at half the price of the amber in lumps. The earthy particles contained in it separate themselves from the hot varnish, if we suffer them to subside before pouring off the liquid.

A flat-bottomed melting pan is preferable to one with a round bottom. The surface being more extensive, the fusion and evaporation proceed with greater rapidity. In round-bottomed melting pans, the amber lying very deep at the middle, is burnt in those places where it lies the shallowest, before the fusion and evaporation are completed.

Mr. Nils Nyström gives the following method of preparing the *Varnish of Linseed Oil*.

"Take a pound of litharge, well pulverized and sifted, four ounces of white vitriol, and a pint of linseed oil. Put the whole into a melting pan, of such dimensions that they do not fill more than half; mix these substances well together, and make them boil till the whole of the moisture has evaporated. This point of evaporation may be known by a pellicle, which forms itself upon the surface of the liquid. It is then to be taken from the fire, and poured clear off, taking care to keep back the litharge and the thick part which deposits itself at the bottom. During the boiling we ought to stir the liquid from time to time, in order to aid the precipitation of the litharge; but it ought not to be stirred constantly, for fear that the finer particles of the litharge might mix with the oil, and render the varnish too thick."

The following directions are given for the preparation of the *Amber Varnish*.

"Take one part of amber, torrefied or melted, according to the process above described, three parts of varnish of linseed oil, and four parts of oil of turpentine. The amber and the linseed-oil varnish ought to be mixed together in a pan, so as to fill only about one-third of its capacity. Place the mixture over a slow fire till the amber be dissolved, which may be known by its frothing up. One ought to have a vessel at hand, for receiving what may run over in case of accident, in order to avoid any waste of the amber. We might also use for this purpose a pan, made after the plan of the boiler invented, in the year 1799, by Mr. Smith, of Philadelphia, for the purpose of preventing the running over of boiling liquids, and which is provided with a double rim, to which are fixed sponges, moistened with water, the contact of which refrigerates the liquid that rises up to them. When the amber is dissolved, the pan is taken off the fire; and when the mixture has cooled, we add to it the essence of turpentine, stirring it constantly

while it we are pouring it out. We then leave the whole to stand quiet for some time, in order that the gross and undissolved particles may subside to the bottom; after which the varnish is poured clear off, strained through linen or fine cloth, and put into bottles."

In boiling the varnish, we ought to take care neither to let it overflow nor take fire; if we neglect the precautions that have just been pointed out, and the accident should unfortunately take place, we should not attempt to extinguish the flames with water; for were we to do that, the varnish would be forcibly thrown out of the vessel, and would burn the imprudent operator; nay, might even set fire to the building itself in which the operation was performed. The safest method is, to extinguish the fire by means of a lid of wood or iron, which ought always to be kept in readiness for fear of accidents.

The proposed object was to obtain a dye, which might perfectly imitate mahogany, and which would keep for as great a length of time as possible. These varnishes, as well as the dyes which the writer describes, have been tried upon various species of wood; of these the maple, the birch, and the white beech, when tinged with a solution of iron, had the greatest resemblance to mahogany. The appearance of the other woods was greatly varied according to the differences of their natural colours and veins, their different degrees of porosity, and the facility with which they imbibed the colouring substance.

AMBERT (*Encycl.*), a small town of France, in the department of Puy de Dome, and late province of Auvergne. It was once remarkable for its paper manufactory and cambrics.

AMBITION (*ambitio*), is generally used in a bad sense, for an immoderate or illegal pursuit of power. In the strict meaning, however, of the word, it signifies the same with the *ambitio* of the Romans. See AMBITUS, in vol. I.

AMBLETEUSE (*Encycl.*), a French sea-port town in the department of the Straits of Calais, and late province of Picardy.

AMBROSE (St.), bishop of Milan, one of the most eminent fathers of the fourth century, born in Gaul in the year 333, according to Dr. Cave, or in 340, as Mr. Du Pin affirms. His father was at this time *praefectus praetorio* in Gaul; and resided at Arles, the capital of Gallia Narbonensis. The birth of Ambrose is said to have been followed with a remarkable preface of his future eloquence; for we are told, that a swarm of bees came and settled upon his mouth as he lay in his cradle. He soon made himself master of the several parts of secular learning; and pleaded causes before Probus with so much eloquence, that he was appointed his assessor, and soon after governor of the provinces of Liguria and Aemilia. He settled at Milan; where, in the year 374, upon the death of Auxentius bishop of that city, there being a great contest between the Catholics and Arians concerning the choice of a new bishop, Ambrose thought it his duty, as governor, to go to the church, in order to compose the tumult. He accordingly addressed himself to the people in a gentle pathetic speech, exhorting them to proceed to their choice, in a calm and friendly manner: while he was speaking to them, the whole assembly cried out with one voice, "Let Ambrose be bishop!" Such a sudden and unexpected incident surprised him extremely; so that he retired immediately, and used every method to divert them from their resolution of choosing him: but at last he was obliged to comply; and was baptised (being but a catechumen before), and ordained bishop, towards the latter end of the year 374, or beginning of 375. About the year 377, the barbarous nations making an incursion into the Roman empire, he fled to Illyricum, and after-

wards to Rome. In the year 384 he was sent to the tyrant Maximus, who had usurped the empire, and prevailed upon him not to pass over into Italy. The heathens being encouraged by these intestine commotions in the empire, attempted to restore their religion, and employed Q. Aurelius Symmachus, prefect of Rome, a man of great eloquence, to plead their cause. This gave rise to the famous contest between St. Ambrose and him, about repairing the altar of Victory. But Symmachus having lost his cause, was expelled the city, and commanded not to approach within one hundred miles of it. The petition which he presented to the emperor Valentinian the younger, is still extant; we find in it the strongest figures of rhetoric and the greatest force of eloquence. St. Ambrose wrote a confutation of this petition; but he has been thought guilty of many paralogisms: and yet he protests, "that he endeavoured only after the solidity of reasoning, leaving Symmachus all the glory of eloquence and politeness; it being (says he) the peculiar privilege of the pagan philosophers to amuse the mind with colours as false as their idols; and to say great things, not being capable of saying true ones." Ambrose met with a good deal of opposition from the Arians, against whom he acted with great spirit and intrepidity. Justina, the empress and mother of Valentinian, who was an Arian, resolving to restore Arianism at Milan, began with demanding of St. Ambrose one of the churches, which was called the Portian church: but he refused it; and the people surrounding the palace in a body, he was obliged to leave him in possession of his church, and even desire him to pacify the people.

Ambrose was a second time left to the tyrant Maximus, for Valentinian found no person so proper to negotiate with him. He spoke to him with great courage and boldness, but could obtain nothing; for Maximus soon after marched into Italy, and made himself master of the western empire: so that Valentinian was obliged to retire, with his mother Justina and his sister Galla, to Thessalonica in Illyricum, in order to desire Theodosius's assistance; who defeated Maximus, and restored Valentinian to the empire.

While Theodosius continued in Italy, after the defeat of Maximus, an insurrection happened at Thessalonica, in which several of the magistrates were stoned, and their bodies dragged along the streets. Theodosius being informed of this, rashly commanded a certain number of the inhabitants to be put to death promiscuously; by which means the city was filled with the blood of many innocent persons, and amongst the rest several strangers who were but just come there: no regard was had to any distinction of persons, no form of trial was observed; but they were cut down like corn in the harvest, as Theodoret expresses it, to the number of 7000. At this time an assembly of bishops was held at Milan, who all expressed an abhorrence of such cruelty in the emperor. Ambrose wrote a letter to him, in which he represented the enormity of his crime, and exhorted him to make satisfaction by a sincere submission and repentance. Some time after, Theodosius coming to Milan, went to receive the sacrament at the great church; where Ambrose meeting him at the door, denied him entrance, and represented his guilt in the most forcible and pathetic terms. The emperor was struck with his words, and with great uneasiness of mind returned to his palace; but about a year after, Ambrose being convinced of the sincerity of his repentance, admitted him into the church.

In 392, Valentinian the emperor being assassinated by the contrivance of Argobastes, and Eugenius usurping the empire, Ambrose was obliged to leave Milan; but he returned the year following, when Eugenius was defeated. He died at Milan the 4th of April, 397; being 57 years of age, according to Mr. Du Pin, and some other writers; but Dr. Cave and

Olearius say that he was 64 years old at his death. He was buried at the great church at Milan. He wrote several works, the most considerable of which is that *De Officiis*. He is concise and sententious in his manner of writing, and full of turns of wit; his terms are well chosen, and his expressions noble; he diversifies his subject by an admirable copiousness of thought and language; he is very ingenious in giving an easy and natural turn to every thing which he treats of, and is not without strength and pathos when there is occasion for it. This is part of the character which Du Pin gives him as a writer; but Erasmus observes that he has many quaint and affected sentences, and frequently very obscure ones; and it is certain that his writings are intermixed with many strange and peculiar opinions. Paulinus wrote his life, and dedicated it to St. Augustin: this life is prefixed to St. Ambrose's works; the best edition of which is reckoned to be that published by the Benedictine monks, in two volumes folio, at Paris, in 1636, and 1690.

AMERDORE (Isaac), an eminent presbyterian minister, was educated at Brazen-nose College, Oxford, where he took the degree of bachelor of arts, and became minister of Preston, and afterwards of Garstang in Lancashire, where he was in 1662 ejected for non-conformity. It was usual with him to retire every year for a month into a little hut in a wood; where he thinned all society, and devoted himself to religious contemplation. Dr. Calamy observes, that he had a very strong impulse on his mind of the approach of death, and took a formal leave of his friends at his house, a little before his departure; and the last night of his life he sent his discourse concerning *angels* to the press. The next day he shut himself up in his parlour; and to the great surprise and regret of all who saw him, he was found just expiring. He died in 1663-4, in the 72d year of his age. He wrote several other books; as the *Prima, Media, & Ultima*, or the First, Middle, and Last Things; War with devils; Looking upon Jesus; &c.

AMBRY. This article in Vol. I. requires to be corrected in the following instances. For "*are deposited*," read *were deposited*;" after "*were laid up*," add "*for distribution*."

AMEDABAD, a considerable city, the capital of Guzerat, in Hindoostan Proper. It is one of the best fortified places in India, and made a good defence when taken by General Goddard, in 1780, from the Poonah Maharrats, to whom it was restored in 1783. Travellers have dwelt much on the beauty and convenient situation of the city, which is in a level country, on the banks of a small navigable river that falls into the gulf of Cambay. It is 321 miles N. of Bombay. Long. 72. 37-E. Lat. 22. 68. N.

AMEDNAGUR, a city of Hindoostan, in the Deccan; once the capital of the Subah of the same name, which is now better known by that of Dowlatabad. This city was the residence of the emperor Aurungzebe, during his conquest of the Deccan and the Carnatic. It is 181 miles, by Poonah, from Bombay. Long. 75. 0. E. Lat. 33. N.

AMES (William), D. D. a learned independent divine, famous for his controversial writings, was born in 1576, and educated at Christ's college, in Cambridge. In the reign of King James I. he left the university, and soon after the king's death, on account of his being unwilling to conform to the rules of the church; and retired to the Hague, where he had not been long before he was invited to accept of the divinity-chair in the university of Franeker, in Friesland, which he filled, with admirable abilities, for above twelve years, during which his fame was so great, that many came from remote nations to be educated under him. He from thence removed to Rotterdam for a change of air which his health demanded; and here he continued during the remainder of his life. His controversial writings, which compose the greatest part of his works, are

chiefly against Bellarmine and the Arminians. He also wrote, 1. A fresh Suit against the Ceremonies. 2. *Lectiões in Psalmos Davidis*. 3. *Medulla Theologicæ*; and several pieces relative to the sciences. He died of an asthma, at Rotterdam, in Nov. 1633.

AMESTRATA (*Encycl.*), a town of Sicily (Cicero) ; *Ame-stratos* (Stephanus) ; *Anafra* (Silius Italicus) ; *Mutisfratos* (Polybius) ; now *Mikretta*, in the Val di Demona, on the river *Halefus* ; a very strong fort of the Carthaginians, besieged in vain by the Romans for seven months with considerable loss ; at length, after another siege, taken and raised (Diodor. Siculus). The appellation is Phœnician, according to Bochart, *Math-Astrata*, and *Am-Astrata*, the city and people of the goddess *Astarte*. The inhabitants are called by Cicero *Ame-stratini*, and *Mutisfratini* by Pliny.

AMHURST (Nicholas), an English poet and political writer, was born at Marden in Kent, and entered of St. John's College, Oxford ; from whence he was expelled for irregularity of conduct and libertine principles. Retaining great resentment against the university on this account, he abused its learning and discipline, and some of the most respectable characters in it ; in a poem published in 1724, *Oculus Britannicæ*, and in a book entitled *Terræ Filius*. He published, A Miscellany of poems, sacred and profane ; and, The Convocation, a poem in five cantos, which was a satire on the Bishop of Bangor's antagonists. But he is best known for the share he had in the political paper called *The Craftsman* ; though, after having been the drudge of his party for near twenty years, he was as much forgot in the famous compromise of 1742, as if he had never been born ; and, when he died in that year of a broken heart, was indebted to the charity of his bookseller for a grave.

AMIANTHUS (*Encycl.*). This substance is also called *Asbestos*, or *Linum Vivum* ; but M. Daubenton distinguishes them thus. In filaments soft and flexible, he calls them *Amiantus* ; and in filaments hard and not flexible, he calls them *Asbestos*. The stones called mountain cork and mountain leather seem to be of the same nature. The ancient Romans made cloths of this stone, which were used for the purpose of wrapping up dead bodies, and were not acted upon by the fire. It is certain that the *Amiantus*, of which there are different kinds, though very refractory, will vitrify by the heat of a violent chemical furnace, or in the focus of a good burning glass, without any additional matter. But it resists the heat of a funeral pile ; nor do the ashes of the wood serve for a dissolvent to it. At present we know that *Amiantus* is a stone or mineral, consisting of threads or filaments, which may be separated from each other, and by art spun and wove into cloth. The *Amiantus*, rare and only found in the East when Pliny wrote, is now got in many parts of Europe. It is commonly found on the sides or at the foot of hills, composed of vitrifiable parts. In the Pyrenæes they make garters, purses, belts, and other small works, of it ; though coarse, they are soft and silky. It is of different colours, white, grey, greenish, and reddish. Its filaments have almost the lustre of silk ; some of the more 14 inches long, and so small that M. Daubenton found some whose diameters were the 2000th part of a line. Naturalists differ about the nature of this stone. It has been ascribed in whole or part to calcareous earth, to gypsum, or to clay. Some make it a sort of iron decomposed by fire ; or a mixture of iron and quartz. They have advanced that it is of a vegetable nature. It has been also considered as a decomposition of stœatite, or of those stones called magnesian. But M. le Conte de Buffon has positively declared it to be a stœatite, or decomposition of mica and talc. Talc is a decomposition of mica, and as the former is softer and more attenuated than the latter, we may conclude that more talc enters into the com-

position of the *Amiantus*, than into that of the *Asbestos*. They are both composed of filaments, either longitudinal, as the *Amiantus*, or oblique and converging, as in the *Asbestos*.

AMID, a town of Turkey in Asia, 40 miles from Amasi, and 60 from Tocat. Long. 36. 40. E. Lat. 40. 30. N.

AMIDA (anc. geog.), a principal city of Mesopotamia (Liber Notitiæ) ; *Ammea* (Ptolemy) ; situated on a high mountain, on the borders of Assyria, on the Tigris, where it receives the Nymphus.—It was taken from the Romans, in the time of the Emperor Constant, by Sapor king of Persia. The siege is said to have cost him 30,000 men ; however, he reduced it to such ruin, that the emperor afterwards wept over it. According to Ammianus Marcellinus, the city was raised ; the chief officers were crucified ; and the rest, with the soldiers and inhabitants, either put to the sword, or carried into captivity, except our historian himself, and two or three more, who, in the dead of the night, escaped through a postern unperceived by the enemy. The inhabitants of Nisibis, however, being obliged to leave their own city by Jovian's treaty with the Persians, soon restored Amida to its former strength ; but it was again taken by Cavades in 501, but was restored to the Romans in 503. On the declension of the Roman power, it fell again into the hands of the Persians ; but was taken from them by the Saracens in 899. It is now in the possession of the Turks. Here are above 20,000 Christians, who are better treated by the Turks than in other places. A great trade is carried on in this city, of red Turkey leather, and cotton cloth of the same colour. The Arabian name of Amida, is *Diarbeker*, and the Turkish one *Kara-Améd*. E. Long. 39. 0. N. Lat. 36. 58.

AMISUS (*Encycl.*), the chief city of Pontus. It was at first a free city, like the other Greek cities in Asia ; but afterwards subdued by Pharnaces king of Pontus, who made it his metropolis. It was taken by Lucullus in the Mithridatic wars, who restored it to its ancient liberty. Close by Amisus stood another city, called *Eupatoria*, from Mithridates Eupator its founder. This city was likewise taken by Lucullus, who levelled it with the ground ; but it was afterwards rebuilt by Pompey, who united it with Amisus, giving them the name of *Pompejopolis*. It was taken during the war between Cæsar and Pompey, by Pharnaces king of Pontus, who put most of its inhabitants to the sword ; but Cæsar, having conquered Pharnaces, made it again a free city.

AMMERCOT, a fort in Hindoostan Proper, a very extensive sandy desert between the Indus, the territories of Agimere and Moultan, and the Pudder. This place is celebrated as the retreat of the emperor Humafoon, during the troubles ; and here was born his son, the illustrious Acbar. It is 190 miles N. by E. of Tatta.

AMMIANUS (Marcellinus), an historian, born at Antioch. He wrote in Latin an interesting history, of which there are now only 18 books extant. Though a Pagan, he speaks with candour and moderation of the Christian religion, and even praises it : his hero is the emperor Julian. He died about the year 390. The best edition of his history is that of *Gronovius*, in 1693.

AMMIRATO (Scipio), an eminent Italian historian, born at Lecce in Naples in 1531. After travelling over great part of Italy, without settling to his satisfaction, he was engaged by the great duke of Tuscany to write *The History of Florence* ; for which he was presented to a canonry in the cathedral there. He wrote other works while in this station ; and died in 1600.

AMMON, the father of the Ammonites, was the son of Lot by his youngest daughter. Gen. xix. 38.

AMMON (Andreas), an excellent Latin poet, born at Lucera in Italy, was sent by Pope Leo X. to England, in the characters of protonotary of the Apostolic See, and collector-ge-

neral of this kingdom. Being a man of singular genius and learning, he soon became acquainted with the principal literati of those times; particularly with Erasmus, Colet, Grocino, and others, for the sake of whose company he resided some time at Oxford. Ammon was Latin secretary to Henry VIII. but at what time he was appointed does not appear. In 1512 he was made canon and prebendary of the collegiate chapel of St. Stephen, in the palace of Westminster. He was likewise prebendary of Wells; and, in 1514, was presented to the rectory of Dychial in that diocese. About the same time, by the king's special recommendation, he was also made prebendary of Salisbury. He died in the year 1517, and was buried in St. Stephen's chapel in the palace of Westminster. He was esteemed an elegant Latin writer, and an admirable poet. The epistles of Erasmus to Ammon abound with encomiums on his genius and learning.—His works are, 1. *Epistole ad Erasmus*, lib. i. 2. *Scoticus confictus historia*, lib. i. 3. *Bucolica vel eclogæ*, lib. i. Basil, 1546, 8vo. 4. *De rebus nihil*, lib. i. 5. *Panegyricus quidam*, lib. i. 6. *Variis generis epigrammata*, lib. i. 7. *Pœmata diversa*, lib. i.

AMMONITES (anc. geog.), a country of Arabia Petraea, occupied by the children of Ammon, whence the appellation. Its limits, partly to the west, and partly to the north, were the river Jabbok, whose course is no-where determined; though Josephus says, that it runs between Rabath-Ammon, or Philadelphia, and Gerasa, and falls into the Jordan.

AMMONIUS, surnamed SAGEAS, was born in Alexandria, and flourished about the beginning of the third century. He was one of the most celebrated philosophers of his age. He took great pains in reconciling the differences between the Platonists and Peripatetics, in which he gained great reputation. Plotinus and Origen were both his disciples. He died about the year 230.

AMONTONS (William), an ingenious experimental philosopher, was born at Paris in 1663. While he was at the grammar-school, he, by sickness, contracted a deafness that almost excluded him conversation: in this situation he applied himself to mechanics and geometry; and, it is said, refused to try any remedy for his disorder, either because he deemed it incurable, or because it increased his attention. He studied the nature of barometers and thermometers with great care; and wrote *Observations and Experiments concerning a new Hour-glass, and concerning Barometers, Thermometers, and Hygroscopes*; which, with some pieces in the *Journal des Savans*, are all his literary works. When the Royal Academy was new regulated in 1699, he was admitted a member; and read his *New Theory of Friction*, in which he happily cleared up an important object in mechanics. He died in 1705.

AMORGOS, or AMUREUS (anc. geog.), now *Morgo*, not far from Naxos to the east, one of the European Sporades; the country of Simonides, the Iambic poet (Strabo). To this island criminals were banished (Tacitus). It was famous for a fine flax called *Emorgis*.

AMORGUS, an island of the Archipelago, fertile in wine, oil, and corn. It is well cultivated, and the inhabitants are affable, and generally of the Greek church. The best parts belong to a monastery. The greatest inconvenience which the inhabitants of this island experience is the want of fuel. It is 30 miles in circumference, and 67 N. of Candia. Long. 26. 15. E. Lat. 36. 20. N.

AMORIUM (*Encycl.*), a town of Phrygia Major, was taken from the Romans by the Saracens in 668; but soon after retaken by the Romans.—A war breaking out again between these two nations in 837, the Roman Emperor Theophilus destroyed Sozopetra the birth-place of the Khalif Al Motasem, notwithstanding his earnest intreaties to him to spare it. This so enraged the Khalif, that he ordered every

one to engrave upon his shield the word *Amorium*, the birth-place of Theophilus, which he resolved at all events to destroy. Accordingly he laid siege to the place, but met with a vigorous resistance. At length, after a siege of 55 days, it was betrayed by one of the inhabitants who had abjured the Christian religion. The Khalif, exasperated at the loss he had sustained during the siege, put most of the men to the sword, carried the women and children into captivity, and levelled the city with the ground. His forces being distressed for want of water on their return home, the Christian prisoners rose upon some of them, and murdered them; upon which the Khalif put 6000 of the prisoners to death.—According to the eastern historians, 30,000 of the inhabitants of Amorium were slain, and as many carried into captivity.

AMORRHITIS (anc. geog.), the country of the Amorites, situated, according to Josephus, between three rivers, like an island; the Arnon on the south, the Jabbok on the north, and the Jordan on the west. The *Amorites*, or *Amorrhæi*, took their name from *Amor*, or *Emor*, the son of Canaan; they dwelt in the mountains of Judah to the south, and in some parts mixed with the Hethæi; also about Sichem: but a great part of them crossed the Jordan, and in a hostile manner occupied a considerable part of the country of the Moabites and Ammonites; which afterwards fell to the Israelites, on the defeat of Sihon their king.

AMOS, the third of the twelve lesser prophets, was a herdsman of the city of Tekoa. He prophesied under Uzzias and Jeroboam II. and foretold the captivity and re-establishment of the ten tribes. He was put to death by Amazias, priest of Bethel, about 785 years before Christ.—He ought not to be confounded with Amos, the father of Isaiah.

AMOUR, a river of Asia, which rises in Siberia, runs east through Chinese Tartary, and falls into the bay of Corea.

AMPELUSIA, a promontory of Mauritania Tingitana, called *Cottes* by the natives, which is of the same signification (Mela); with a town of the same name (Pliny); not far from the river Lixus, near the straits of Gibraltar: now *Cape Spartel*. W. long. 6. 30. Lat. 36. 0.

AMPHILOCHIA, the territory of the city of Argos in Acarnania; *Amphilochium* (Thucydides); called *Amphilochi*, from the people, in the lower age (Stephanus). A town also of Spain, in Galicia, built by Teucer, and denominated from Amphilochus, one of his companions (Strabo); now *Orense*. W. long. 8. 20. Lat. 42. 36.

AMPHILOCHIUS, bishop of Iconium, in the fourth century, was the friend of St. Gregory Nazianzen and St. Basil. He assisted at the first general council of Constantinople in 381; presided at the council of Side, and was a strenuous opposer of the Arians. He died in 394; and his works were published in Greek and Latin, at Paris, 1644; by Francis Combefis.

AMPHILOCHUS, son of Amphiaræus and Eriphyle, was a celebrated diviner. He had an altar erected to him at Athens, and an oracle at Mallus in Cilicia, which city was founded by him and Mopsus. The answers of this oracle were given by dreams; the party enquiring used to pass a night in the temple, and that night's dream was the answer. Dion Cassius mentions a picture done by order of Sextus Condianus, representing the answer he received of the oracle, in the reign of the Emperor Commodus.

AMPHISSA, the capital of the Locri Oxolia, one hundred and twenty stadia, or 15 miles, to the west of Delphi (Pausanias). So called, because surrounded on all hands by mountains (Stephanus). Hence *Amphissæi*, the inhabitants; who plundered the temple at Delphi (Demosthenes).—Also a town of Magna Græcia, at the mouth of the Sagra, on the coast of the Farther Calabria, situated between Locri and Caulonia, now called *Rocella*. *Amphissius* the epithet (Ovid).

AMPLEPUIS, a town of France, in the department of Rhone and Loire. It is celebrated for its wines, and is 16 miles east of Roanne.

AMURAT, or **AMURATH**, I. the fourth emperor of the Turks, and one of the greatest princes of the Ottoman empire, succeeded Solyman in 1360. He took from the Greeks Gallipoli, Thrace, and Adrianople, which last he chose for the place of his residence. He defeated the Prince of Bulgaria, conquered Missina, chastised his rebellious bashaws, and is said to have gained 36 battles. This prince, in order to form a body of devoted troops that might serve as the immediate guards of his person and dignity, appointed his officers to seize annually, as the imperial property, the fifth part of the Christian youth taken in war. These, after being instructed in the Mahometan religion, inured to obedience by severe discipline, and trained to warlike exercises, were formed into a body distinguished by the name of *Janissaries*, or *New Soldiers*. Every sentiment which enthusiasm can inspire, every mark of distinction that the favour of the prince could confer, were employed in order to animate this body with martial ardour, and with a conscientiousness of its own pre-eminence. The Janissaries soon became the chief strength and pride of the Ottoman armies, and were distinguished above all the troops whose duty it was to attend on the person of the sultan.—At length the death of Lazarus, despot of Servia, who had endeavoured in vain to stop the progress of Amurath's arms, touched Milo, one of his servants, in so sensible a manner, that, in revenge, he stabbed the sultan in the midst of his troops, and killed him upon the spot, A. D. 1399, after he had reigned 33 years.

AMURAT II. the 10th emperor of the Turks, was the eldest son of Mahomet I. and succeeded his father in 1421. He besieged Constantinople and Belgrade without success; but he took Theoflania from the Venetians, and compelled the Prince of Bosnia and John Castriot prince of Albany to pay him tribute. He obliged the latter to send his three sons as hostages; among whom was George, celebrated in history by the name of *Scanderbeg*. John Hunniades defeated Amurat's troops, and obliged him to make peace with the Christian princes, in 1442. These princes afterwards breaking the peace, Amurat defeated them in the famous battle of Varna, November 10, 1444, which proved so fatal to the Christians, and in which Ladislaus king of Hungary was killed. He afterwards defeated Hunniades, and killed above 20,000 of his men; but George Castriot, more known by the name of *Scanderbeg*, being re-established in the estates of his father, defeated the Turks several times, and obliged Amurat to raise the siege of Croia, the capital of Albany. Amurat died, chagrined with his ill success, and infirm with age, February 11, 1451, at Adrianople. It is observed to this prince's honour, that he always kept his treaties with the greatest fidelity.

AMWELL, a village near Ware in Hertfordshire, famous for giving rise to the New River, which supplies London with water. One part is called Amwell-Magna, and the other Amwell-Parva, at which is the head of the river.

AMYCLÆ (*Encycl.*). This city of Laconia was afterwards famed for sending a considerable colony of its own inhabitants into Upper Calabria, who built there a city which they called by the same name. This last city was situated between Cajea and Terracina, and gave its name to the neighbouring sea. According to Pliny and Solinus, the territory of Amyclæ was so infested with vipers and other serpents, that the inhabitants were obliged to abandon their dwellings, and settle elsewhere.—Among the ancient poets, the Amyclæ, or inhabitants of this city, obtained the epithet of *taciti* or *silent*. The reason of this was, either because it was built by the Lacedæmonians, who, as they followed the doctrine of Pythagoras, were always inculcating the precept of silence, and thence call-

ed *taciti*; or because of a law which obtained in this place, forbidding any one, under severe penalties, to mention the approach of an enemy. Before this law was made, the city was daily alarmed by false reports, as the enemy had been already at the gates. From terrors of this kind, the above-mentioned law indeed delivered them; but in the end it proved the ruin of the city: for the Dorians appearing unexpectedly under the walls, no one ventured to transgress the law; so that the city was easily taken. They reduced it to an inconceivable hamlet; in which, however, were seen some of the remains of its ancient grandeur. One of the finest buildings that escaped the common ruin, was the temple and statue of Alexandra, whom the inhabitants pretended to be the same with Cassandra the daughter of Priam.

AMYRAULT (Moses), an eminent French Protestant divine, born at Bourguil in Touraine in 1596. He studied at Saumur, where he was chosen professor of theology; and his learned works gained him the esteem of Catholics as well as Protestants, particularly of Cardinal Richelieu, who consulted him on a plan of re-uniting their churches, which, however, as may well be supposed, came to nothing. He published a piece in which he attempted to explain the mystery of predestination and grace, which occasioned a controversy between him and some other divines. He also wrote *An Apology for the Protestants*; *A Paraphrase on the New Testament*; and several other books. This eminent divine died in 1664.

ANABAPTISTON, the same with **ABAPTISTON**. **ANABAPTISTS** (*Encycl.*). This Protestant sect sprung up in Germany immediately after the Reformation. It was founded in the year 1521, by Nicholas Storck, Mark Stubner, and Thomas Muncer; who had been followers of Luther, but abandoned him on pretence that his doctrine was imperfect. Storck being a man of no learning, boasted of inspirations; Stubner, who had wit and some learning, applied himself to find out suitable explanations of the word of God; and Muncer, who was bold and zealous, played the enthusiast in the most extravagant manner.

The most remarkable of their religious tenets related to the sacrament of baptism; which, as they contended, ought to be administered only to persons grown up to years of understanding, and should be performed not by sprinkling them with water, but by dipping them in it: for this reason they condemned the baptism of infants; and re-baptizing all whom they admitted into their society, the sect came to be distinguished by the name of *Anabaptists*. To this peculiar notion concerning baptism, which has the appearance of being founded on the practice of the church in the apostolic age, and contains nothing inconsistent with the peace and order of human society, they added other principles of a most enthusiastic as well as dangerous nature. They maintained, that among Christians, who had the precepts of the gospel to direct, and the spirit of God to guide them, the office of magistracy was not only unnecessary, but an unlawful encroachment on their spiritual liberty; that the distinctions occasioned by birth, or rank, or wealth, being contrary to the spirit of the gospel, which considers all men as equal, should be entirely abolished; that all Christians, throwing their possessions into one common stock, should live together in that state of equality which becomes members of the same family; that as neither the laws of nature, nor the precepts of the New Testament, had placed any restraints upon men with regard to the number of wives which they might marry, they should use that liberty which God himself had granted to the patriarchs.

By these doctrines they soon drew over vast numbers to their side; inasmuch that Muncer ventured openly to exhort the people to resist the magistrates, and constrain princes to divest themselves of their authority. Accordingly the peasants of

Germany, to whom the idea of unlimited independence was peculiarly flattering, rose in many places, and committed a thousand acts of violence. But they were defeated by the troops of the empire, with great slaughter; and Muncer, who had deluded them, was taken, and beheaded in the year 1525.

But though the insurrection excited by that fanatic was soon suppressed, several of his followers lurked in different places, and endeavoured privately to propagate his opinions.

In those provinces of Upper Germany which had already been so cruelly waited by their enthusiastic rage, the magistrates watched their motions with such severe attention, that many of them found it necessary to retire into other countries; some were punished, others driven into exile, and their errors were entirely rooted out. But in the Netherlands and Westphalia, where the pernicious tendency of their opinions was more unknown, and guarded against with less care, they got admittance into several towns, and spread the infection of their principles.

In particular, two Anabaptist prophets, John Matthias, a baker of Haerlem, and John Boccold, or Beukels, a journeyman taylor of Leyden, possessed with the rage of making profelytes, fixed their residence at Munster, an imperial city in Westphalia, of the first rank, under the sovereignty of its bishop, but governed by its own senate and consuls. As neither of these fanatics wanted the talents necessary for such an undertaking, great resolution, the appearance of sanctity, bold pretensions to inspiration, and a confident and plausible manner of discoursing, they soon gained many converts. Among these were Rothman, who had first preached the Protestant doctrine in Munster, and Cnipperdoling, a citizen of good birth and considerable eminence. Emboldened by the countenance of such disciples, they openly taught their opinions; and not satisfied with that liberty, they made several attempts, though without success, to seize the town, in order to get their tenets established by public authority. At last, having secretly called in their associates from the neighbouring country, they suddenly took possession of the arsenal and senate-house in the night-time; and running through the streets with drawn swords, and horrible howlings, cried out alternately, "Repent, and be baptized," and "Depart, ye ungodly." The senators, the canons, the nobility, together with the more sober citizens, whether Papists or Protestants, terrified at their threats and outcries, fled in confusion; and left the city under the dominion of a frantic multitude, consisting chiefly of strangers. Nothing now remaining to overawe or control them, they set about modelling the government according to their own wild ideas; and though at first they shewed so much reverence for the ancient constitution, as to elect senators of their own sect, and to appoint Cnipperdoling and another profelyte consuls, this was nothing more than form; for all their proceedings were directed by Matthias, who in the style and with the authority of a prophet uttered his commands, which it was instant death to disobey. Having begun with encouraging the multitude to pillage the churches, and deface their ornaments; he enjoined them to destroy all books, except the bible, as useless or impious; he appointed the estates of such as fled to be confiscated, and sold to the inhabitants of the adjacent country; he ordered every man to bring forth his gold, silver, and precious effects, and to lay them at his feet: the wealth amassed by these means he deposited in a public treasury, and named deacons to dispense it for the common use of all. The members of his commonwealth being thus brought to a perfect equality, he commanded all of them to eat at tables prepared in public, and even prescribed the dishes which were to be served up each day. Having finished his plan of reformation, his next care was to provide for the defence of the city; and he took measures for that purpose with a prudence which fa-

voured nothing of fanaticism. He collected vast magazines of every kind; he repaired and extended the fortifications, obliging every person to work in his turn; he formed such as were capable of bearing arms into regular bodies, and endeavoured to add the vigour of discipline to the impetuosity of enthusiasm. He sent emissaries to the Anabaptists in the Low-countries, inviting them to assemble at Munster, which he dignified with the name of *Mount Zion*, that from thence they might set out to reduce all the nations of the earth under their dominion. He himself was unwearied in attending to every thing necessary for the security or increase of the sect; animating his disciples by his own example to refuse no labour, as well as to repine at no hardship; and their enthusiastic passions being kept from subsiding by a perpetual succession of exhortations, revelations, and prophecies, they seemed ready to undertake or to suffer any thing in maintenance of their opinions.

Meanwhile, the Bishop of Munster having assembled a considerable army, advanced to besiege the town. On his approach, Matthias sallied out at the head of some chosen troops; attacked one quarter of his camp; forced it; and, after great slaughter, returned to the city, loaded with glory and spoil. Intoxicated with this success, he appeared next day brandishing a spear; and declared that, in imitation of Gideon, he would go forth with a handful of men and smite the host of the ungodly. Thirty persons, whom he named, followed him without hesitation in this wild enterprise, and rushing on the enemy with a frantic courage were cut off to a man. The death of their prophet occasioned at first great consternation among his disciples; but Boccold, by the same gifts and pretensions which had gained Matthias credit, soon revived their spirits and hopes to such a degree, that he succeeded him in the same absolute direction of all their affairs. As he did not possess that enterprising courage which distinguished his predecessor, he satisfied himself with carrying on a defensive war, and, without attempting to annoy the enemy by sallies, he waited for the succours he expected from the Low-countries, the arrival of which was often foretold and promised by their prophets. But though less daring in action than Matthias, he was a wilder enthusiast, and of more unbounded ambition. Soon after the death of his predecessor, having by obscure visions and prophecies prepared the multitude for some extraordinary event, he stripped himself naked, and, marching through the streets, proclaimed with a loud voice, "That the kingdom of Zion was at hand; that whatever was highest on earth should be brought low, and whatever was lowest should be exalted." In order to fulfil this, he commanded the churches, as the most lofty buildings in the city, to be levelled with the ground; he degraded the senators chosen by Matthias; and depriving Cnipperdoling of the consularship, the highest office in the commonwealth, he appointed him to execute the lowest and most infamous, that of common hangman; to which strange transition the other agreed, not only without murmuring, but with the utmost joy; and such was the despotism and rigour of Boccold's administration, that he was called almost every day to perform some duty or other of his wretched function. In place of the deposed senators, he named twelve judges, according to the number of tribes in Israel, to preside in all affairs; retaining to himself the same authority which Moses anciently possessed as legislator of that people.

Not satisfied, however, with power or titles which were not supreme, a prophet, whom he had gained and tutored, having called the multitude together, declared it to be the will of God, that John Boccold should be King of Zion, and sit on the throne of David. John kneeling down, accepted of the heavenly call, which he solemnly protested had been revealed likewise

to himself; and was immediately acknowledged as a monarch by the deluded multitude. From that moment he assumed all the state and pomp of royalty. He wore a crown of gold, and the richest and most sumptuous garments. A bible was carried on his one hand, a naked sword on the other. A great body of guards accompanied him when he appeared in public. He coined money stamped with his own image, and appointed the great officers of his household and kingdom, among whom Cnipperdoling was nominated governor of the city, as a reward for his former submission.

Having now attained the height of power, Boccold began to discover passions, which he had hitherto restrained, or indulged only in secret. As the excesses of enthusiasm have been observed in every age to lead to sensual gratifications, the same constitution that is susceptible of the former being remarkably prone to the latter, he instructed the prophets and teachers to harangue the people for several days concerning the lawfulness and even necessity of taking more wives than one, which they asserted to be one of the privileges granted by God to the saints. When their ears were once accustomed to this licentious doctrine, and their passions inflamed with the prospect of such unbounded indulgence, he himself set them an example of using what he called their Christian liberty, by marrying at once three wives, among which the widow of Matthias, a woman of singular beauty, was one. As he was allured by beauty, or the love of variety, he gradually added to the number of his wives, until they amounted to fourteen, though the widow of Matthias was the only one dignified with the title of *queen*, or who shared with him the splendor and ornaments of royalty. After the example of their prophet, the multitude gave themselves up to the most licentious and uncontrolled gratification of their desires. No man remained satisfied with a single wife. Not to use their Christian liberty was deemed a crime. Persons were appointed to search the houses for young women grown up to maturity, whom they instantly compelled to marry. Together with polygamy, freedom of divorce, its inseparable attendant, was introduced, and became a new source of corruption. Every excess was committed of which the passions of men are capable, when restrained neither by the authority of laws nor the sense of decency; and by a monstrous and almost incredible conjunction, voluptuousness was engrafted on religion, and dissolute riot accompanied the austerities of fanatical devotion.

Meanwhile, the German princes were highly offended at the insult offered to their dignity by Boccold's presumptuous usurpation of royal honours; and the profligate manners of his followers, which were a reproach to the Christian name, filled men of all professions with horror. Luther, who had testified against this fanatical spirit on its first appearance, now deeply lamented its progress; and, exposing the delusion with great strength of argument, as well as acrimony of style, called loudly on all the states of Germany to put a stop to a frenzy no less pernicious to society than fatal to religion. The emperor, occupied with other cares and projects, had no leisure to attend to such a distant object. But the princes of the empire, assembled by the King of the Romans, voted a supply of men and money to the Bishop of Munster, who, being unable to keep a sufficient army on foot, had converted the siege of the town into a blockade. The forces raised in consequence of this resolution were put under the command of an officer of experience; who, approaching the town towards the end of spring, in the year 1535, pressed it more closely than formerly; but found the fortifications so strong, and so diligently guarded, that he durst not attempt an assault. It was now above fifteen months since the Anabaptists had established their dominion in Munster; they had during that time undergone prodigious fatigue in working on the fortifications, and performing mili-

tary duty. Notwithstanding the prudent attention of their king to provide for their subsistence, and his frugal and regular economy in their public meals, they began to feel the approach of famine. Several small bodies of their brethren, who were advancing to their assistance from the Low-countries, had been intercepted, and cut to pieces; and while all Germany was ready to combine against them, they had no prospect of success. But such was the ascendancy which Boccold had acquired over the multitude, and so powerful the fascination of enthusiasm, that their hopes were as sanguine as ever; and they hearkened with implicit credulity to the visions and predictions of their prophets, which assured them, that the Almighty would speedily interpose, in order to deliver the city. The faith, however, of some few, shaken by the violence and length of their sufferings, began to fail; but being suspected of an inclination to surrender to the enemy, they were punished with immediate death, as guilty of impiety in distrusting the power of God. One of the king's wives having uttered certain words that implied some doubt concerning his divine mission, he instantly called the whole number together; and commanding the blasphemer, as he called her, to kneel down, cut off her head with his own hands; and so far were the rest from expressing any horror at this cruel deed, that they joined him in dancing with a frantic joy around the bleeding body of their companion.

By this time, the besieged endured the utmost rigour of famine; but they chose rather to suffer hardships, the recital of which is shocking to humanity, than to listen to the terms of capitulation offered them by the bishop. At last, a deserter, whom they had taken into their service, being either less intoxicated with the fumes of enthusiasm, or unable any longer to bear such distress, made his escape to the enemy. He informed their general of a weak part in the fortifications which he had observed; and assuring him that the besieged, exhausted with hunger and fatigue, kept watch there with little care, he offered to lead a party thither in the night. The proposal was accepted, and a chosen body of troops appointed for the service; who, scaling the walls unperceived, seized one of the gates, and admitted the rest of the army. The Anabaptists, though surprised, defended themselves in the market-place with valour, heightened by despair; but, being overpowered by numbers, and surrounded on every hand, most of them were slain, and the remainder taken prisoners. Among the last were the king and Cnipperdoling. The king, loaded with chains, was carried from city to city as a spectacle to gratify the curiosity of the people, and was exposed to all their insults. His spirit, however, was not broken or humbled by this sad reverse of his condition; and he adhered with unshaken firmness to the distinguishing tenets of his sect. After this, he was brought back to Munster, the scene of his royalty and crimes, and put to death with the most exquisite and lingering tortures, all which he bore with astonishing fortitude. This extraordinary man, who had been able to acquire such amazing dominion over the minds of his followers, and to excite commotions so dangerous to society, was only 26 years of age.

Together with its monarch, the kingdom of the Anabaptists came to an end. Their principles having taken deep root in the Low-countries, the party still subsists there, under the name of *Mennonites*; but by a very singular revolution, this sect, so mutinous and sanguinary at its first origin, hath become altogether innocent and pacific. Holding it unlawful to wage war, or to accept of civil offices, they devote themselves entirely to the duties of private citizens, and by their industry and charity endeavour to make reparation to human society for the violence committed by their founders. A small number of this sect, which originally settled in England, have of late years greatly increased. But, apparently, peculiar te-

nets concerning baptism, are without any dangerous mixture of enthusiasm, and they have shewn themselves the supporters of good government in many instances.

Within these 20 years, the Anabaptists have formed a congregation in Edinburgh, which is the first appearance they ever made in Scotland. They pray for the king and all inferior magistrates; and subject themselves, in civil matters, to every ordinance of man, for the Lord's sake. They consider the kingdom of Christ to be spiritual, and not of this world; and are strictly upon the congregational or independent plan, admitting of no jurisdiction or authority, in matters of religion, but that of the Great Lawgiver. Their church officers are bishops, or elders, and deacons, and these they generally choose from among themselves. They make the reading of the scriptures a part of their public service, and eat the Lord's supper every Sabbath-day. Their disciples, before they are admitted into communion, are first baptized in the Water of Leith, which they do at all seasons of the year, and, on these occasions, they are generally attended by a great number of spectators.

ANACATHARSIS, in medicine, signifies a salivation, or discharge of humours by spitting.

ANACATHARTICS, properly signify such medicines as promote the discharge of saliva.

ANACOPIR, the capital of the nation of the Abkhas, in Asia, on the river Makai, which falls below it into the Black Sea.

ANADIR, a considerable river of Siberia, that falls into the Eastern Ocean.

ANAGNIA, a town of Latium, capital of the Hernici (Livy, Pliny, Virgil); which, after a faint resistance, submitting to the Romans, was admitted to the freedom of the city, yet without the right of suffrage (Livy). It was afterwards a colony of Drusus Cæsar, and walled round, and its territory assigned to the veterans (Frontinus). Here Antony married Cleopatra, and divorced Octavia. Now *Anagni*, 36 miles to the east of Rome. Long. 13. 45. Lat. 42. 48.

ANANIAS, a Sadducee, high-priest of the Jews, who put to death St. James the brother of our Lord, and was deposed by Agrippa.

ANAPHE (anc. geog.), an island spontaneously emerging out of the Cretan sea, near Thera (Pliny, Strabo). Now called *Nanfio*. Its name is from the sudden appearance of the new moon to the Argonauts in a storm (Apollonius). *Anaphæus*, an epithet of Apollo, who was worshipped there. *Anaphæi*, the people.

ANASTASIS, a term among ancient physicians, for a rising up to go to stool. It also signified the passage of any humour, when expelled from one part, and obliged to remove to another.

ANASTASIUS, surnamed BIBLIOTHECARIUS, a Roman abbot, library-keeper of the Vatican, and one of the most learned men of the ninth century, assisted in 869 at the fourth general council, the acts and canons of which he translated from the Greek into Latin. He also composed the lives of several popes, and other works; the best edition of which is that of the Vatican.

ANATHEMA, besides the other senses in which the term is used, likewise denotes Christian offerings, otherwise called donations. See DONATIONS.

ANATOTM, one of the islands called the New Hebrides, in the South Pacific Ocean. Long. 170. 9. E. Lat. 20. 10. S.

ANAXARCHUS, a philosopher of Abdera, highly esteemed by Alexander the Great. His end was peculiarly tragical: having the misfortune to fall into the hands of the enemy, they pounded him alive in a mortar.

ANAXIMANDER, a famous Greek philosopher, born at

Miletus in the 42d Olympiad, in the time of Polycrates tyrant of Samos. He was the first who publicly taught philosophy, and wrote upon philosophical subjects. He carried his researches into nature very far for the time in which he lived. It is said, that he discovered the obliquity of the Zodiac; was the first who published a geographical table, invented the gnomon, and set up the first fun-dial in an open place at Lacedæmon. He taught, that infinity of things was the principal and universal element; that this infinite always preferred its unity, but that its parts underwent changes; that all things came from it; and that all were about to return into it. According to all appearance, he meant by this obscure and indeterminate principle the chaos of the other philosophers. He asserted, that there are an infinity of worlds; that the stars are composed of air and fire, which are carried in their spheres, and that these spheres are gods; and that the earth is placed in the midst of the universe, as in a common centre. He added, that infinite worlds were the product of infinity, and that corruption proceeded from separation.

ANAXIMENES, born at Miletus, an eminent Greek philosopher, friend, scholar, and successor of Anaximander. He diffused some degree of light upon the obscurity of his master's system. He made the first principle of things to consist in the air, which he considered as immense or infinite, and to which he ascribed a perpetual motion. He asserted, that all things which proceeded from it, were definite and circumscribed; and that this air, therefore, was God; since the divine power resided in it and agitated it. Coldness and moisture, heat and motion, rendered it visible, and dressed it in different forms, according to the different degrees of its condensation. All the elements thus proceed from heat and cold. The earth was, in his opinion, one continued flat surface.

ANAXIMENES, the son of Aristocles of Lampfacus, an orator, the disciple of Diogenes the Cynic, and of Zolus the railer against Homer. He was preceptor to Alexander of Macedon, and followed him to the wars. Alexander being incensed against the people of Landiacus, they sent this philosopher to intercede for them. Alexander knowing the cause of his coming, swore that he would do the very reverse of what he desired of him. Anaximenes begged of him to destroy Lampfacus. Alexander, unwilling to break his oath, and not able to elude this stratagem, pardoned Lampfacus much against his will.

ANAZARBUS (Pliny); ANAZARBA (Stephanus); a town of Cilicia, on the river Pyramus, the birth place of Dioleorides, and of the poet Oppian. It was sometimes called *Cæsarea*, in honour either of Augustus or of Tiberius. The inhabitants are called *Anazarbeni* (Pliny): and on coins *Anazarbeis*, after the Greek idiom. It was destroyed by a dreadful earthquake in the year 525, along with several other important cities: but they were all repaired at a vast expence by the emperor Justin; who was so much affected with their misfortune, that, putting off the diadem and purple; he appeared for several days in sackcloth.

ANCILLON (David), a minister of the reformed church at Metz, where he was born the 17th of March, 1617. He studied from the ninth or tenth year of his age in the Jesuits' College, where he gave such proofs of his genius, that the heads of the society tried every means to draw him over to their religion and party; but he continued firm against their attacks. He went to Geneva in 1623; and studied divinity under Spanheim, Diodati, and Tronchin, who conceived a very great esteem for him. He left Geneva in April 1641, and offered himself to the synod of Charenton in order to take upon him the office of a minister: his abilities were greatly admired by the examiners; and the whole assembly were to

highly pleased with him; that they gave him the church of Meaux, the most considerable then unprovided for. Here he acquired a vast reputation for his learning, eloquence, and virtue, and was even highly respected by those of the Roman-catholic communion. He returned to his own country in the year 1653, where he remained till the revocation of the edict of Nantes in 1685. He retired to Francfort after this fatal blow; and having preached in the French church at Hanau, the whole congregation were so edified by it, that they immediately called together the heads of the families, in order to propose that he might be invited to accept of being minister there. The proposition was agreed to; and he began the exercise of his ministry in that church about the end of the year 1685. His preaching made to great a noise at Hanau, that the professors of divinity, and the German and Dutch ministers, attended his sermons frequently: the count of Hanau himself, who had never before been seen in the French church, came thither to hear Mr. Ancillon: they came from the neighbouring parts, and even from Francfort; people who understood nothing of French flocked together with great eagerness, and said they loved to see him speak. This occasioned a great jealousy in the two other ministers; which tended to make his situation uneasy. He therefore went to Berlin; where he met with a kind reception from his highness the elector, and was made minister of the city. Here he had the pleasure of seeing his eldest son made judge and director of the French in the same city, and his other son rewarded with a pension, and entertained at the university of Francfort upon the Oder. He had likewise the satisfaction of seeing his brother made judge of all the French in the states of Brandenburg; and Mr. Cayart his son-in-law, engineer to his electoral highness. He enjoyed these agreeable circumstances, and several others, till his death, which happened at Berlin the 3d of September, 1692, when he was seventy-five years of age.—Mr. Ancillon having got a considerable fortune by marriage, was enabled thereby to gratify his passion for books; his library was accordingly very curious and large, and he increased it every day with all that appeared new and important in the republic of letters, so that at last it was one of the noblest collections in the hands of any private person in the kingdom. He published a book, in quarto, in which the whole dispute concerning Traditions is fully examined: he also wrote an apology for Luther, Zuinglius, Calvin, and Beza, and several other pieces.

ANCOBER, a territory on the gold coast of Guinea, having a river of the same name flowing through it, the banks of which are adorned with fine lofty trees, affording a very agreeable shade. On the western bank is a populous village.

ANCOURT (Florent-Cartan d'), an eminent French actor and dramatic writer, born at Fontainebleau, October 1661. He studied in the Jesuits' College at Paris, under Father De la Rue; who, discovering in him a remarkable vivacity and capacity for learning, was extremely desirous of engaging him in their order; but Ancourt's aversion to a religious life rendered all his efforts ineffectual. After he had gone through a course of philosophy, he applied himself to the civil law, and was admitted advocate at seventeen years of age. But falling in love with an actress, he was induced to go upon the stage, and he married her. As he had all the qualifications necessary for the theatre, he soon greatly distinguished himself; and not being satisfied with the applause only of an actor, he began to write pieces for the stage; many of which had such prodigious success, that most of the players grew rich from the profits of them. His merit in this way procured him a very favourable reception at court; and Lewis XIV. shewed him many marks of his favour. His sprightly conversation and

polite behaviour made his company agreeable to all the men of figure both at court and in the city, and the most considerable persons were extremely pleased to have him at their houses. Having taken a journey to Dunkirk, to see his eldest daughter who lived there, he took the opportunity of paying his compliments to the Elector of Bavaria, who was then at Brussels: this prince received him with the utmost civility; and having detained him a considerable time, dismissed him with a present of a diamond valued at 1000 pistoles: he likewise rewarded him in a very generous manner, when, upon his coming to Paris, Ancourt composed an entertainment for his diversion. Ancourt began at length to grow weary of the theatre, which he quitted in Lent 1718, and retired to his estate of Courcelles le Roy, in Berry, where he applied himself wholly to devotion, and composed a translation of David's Psalms in verse, and a sacred tragedy, which were never printed. He died the 6th of December, 1726, being sixty-five years of age.—The plays which he wrote are fifty-two in all; most of which were printed separately at the time when they were first represented: they were afterwards collected into five volumes, then into seven, and at last into nine. This last edition is the most complete.

ANCUS MARTIUS, the fourth king of the Romans, succeeded Tullius Hostilius, 639 years before Christ. He defeated the Latins, subdued the Fidenates, conquered the Sabines, Volsci, and Veientes, enlarged Rome by joining to it mount Janicula, and made the harbour of Ostia. He died about 615 years before the Christian æra.

ANDAYE, a fortified town of France, in the department of the Lower Pyrenæes. It is very famous for its brandy, and is situated at the mouth of the river Bidaissa, opposite Fontarabá in Spain, eighteen miles from Bayonne. Long. 1. 45. W. Lat. 43. 25. N.

ANDECAVI (Tacitus); ANDEGAVI (Pliny); ANDES (Cæsar); ANDI (Lucan); a people of Gallia Celtica, having the Turones to the east, the Namnetes to the west, the Pistones to the south, and the Auleri Cænomani to the north: now *Angou*.

ANDEGAVI, or ANDEGAVUS, a town of Gallia Celtica (Pliny, Ptolemy); now *Angiers*. Called *Andecavi* (Tacitus). W. Long. 30. Lat. 47. 30.

ANDEOL (St.), a town of France, in the Vivarez, five miles S. of St. Viviers, whose bishop formerly resided there. E. Long. 2. 50. N. Lat. 44. 24.

ANDERAB (*Encycl.*), a city of the province of Balkh. It is very rich and populous, and a place of no great strength. The neighbouring mountains yield excellent quarries of lapis lazuli, in which the Balkhians drive a great trade with Persia and India.—This city is situated at the foot of the mountains dividing the dominion of the Great Mogul and Persia from Great Bukharia. As there is no other way of crossing these mountains but by the road through this city, all travellers with goods must pay 4 per cent. On this account the Khan of Balkh maintains a good number of soldiers in the place.

ANDERSON (Sir Edmund), a younger son of an ancient Scotch family settled in Lincolnshire. He was some time a student of Lincoln College, Oxford; and removed from thence to the Inner Temple, where he applied himself diligently to the study of the law, and became a barrister. In the ninth of Queen Elizabeth, he was both lent and summer reader, and in the sixteenth double reader. He was appointed her majesty's serjeant at law in the nineteenth of her reign; and some time after, one of the justices of assize. In 1582 he was made lord chief-justice of the Common Pleas, and in the year following was knighted. He held this office to the end of his life, died in the year 1605, and was buried at Eyworth in Bedfordshire.

He was an able, but punctilious lawyer; a scourge to the Puritans; and a strenuous supporter of the established church. His works are, 1. Reports of many principal cases argued and adjudged in the time of Queen Elizabeth, in the common bench. Lond. 1644, folio. 2. Resolutions and judgments on the cases and matters agitated in all the courts of Westminster, in the latter end of the reign of Queen Elizabeth. Published by John Goldborough, esq. Lond. 1653, 4to. Besides these, there is a manuscript copy of his Readings still in being.

ANDES (*Encycl.*), a great chain of mountains in South America. To what has already been said of these we wish to add the following account.

The Spaniards call them the *Cordillera de los Andes*; they form two ridges, the lowermost of which is overpread with woods and groves, and the uppermost covered with everlasting snow. Those who have been at the top, affirm, that the sky is always serene and bright; the air cold and piercing; and yet so thin, that they were scarce able to breathe, and the respiration was much quicker than ordinary; and this is attended with reaching and vomiting; which, however, has been considered by some as merely accidental. When they looked downwards, the country was hid by the clouds that hovered on the mountains' sides. The mountains just mentioned, which have been frequently ascended, are much inferior in height to many others in this enormous chain. The following is the account given of the mountain called *Pichincha*, by the mathematicians sent by the kings of France and Spain to make observations in relation to the figure of the earth.

Soon after our artists arrived at Quito, they determined to continue the series of the triangles for measuring an arch of the meridian to the S. of that city: the company accordingly divided themselves into two bodies, consisting of French and Spaniards, and each retired to the part assigned them. Don George Juan and M. Godin, who were at the head of one party, went to the mountain of Pambamarca; while M. Bouguer, De la Condamine, and Don Ulloa, together with their assistants, climbed up to the highest summit of Pichincha. Both parties suffered extremely, as well from the severity of the cold, as from the impetuosity of the winds, which on these heights blow with incessant violence; difficulties the more painful, as they had been little used to such sensations. Thus in the torrid zone, nearly under the equinoctial, where it is natural to suppose they had most to fear from the heat, their greatest pain was caused by the excessiveness of the cold.

Their first scheme for shelter and lodging in these uncomfortable regions, was to pitch a field-tent for each company; but on Pichincha this could not be done from the narrowness of the summit: they were therefore obliged to be contented with a hut so small that they could hardly all creep into it. Nor will this appear strange, if the reader considers the bad disposition and smallness of the place, it being one of the loftiest crags of a rocky mountain, 100 fathoms above the highest part of the desert of Pichincha. Such was the situation of their mansion, which, like all the other adjacent parts, soon became covered with ice and snow. The ascent up this stupendous rock, from the base, or the place where the mules could come, to their habitation, was so craggy as only to be climbed on foot; and to perform it cost them four hours continual labour and pain, from the violent efforts of the body, and the subtilty of the air; the latter being such as to render respiration difficult.

The strange manner of living to which our artists were reduced during the time they were employed in a geometrical mensuration of some degrees of the meridian, may not perhaps prove unentertaining to the reader; and therefore the following account is given as a specimen of it. The desert of

Pichincha, both with regard to the operations performed there, and its inconveniences, differing very little from others, an idea may be very easily formed of the fatigues, hardships, and dangers, to which they were continually exposed during the time they were prosecuting the enterprize, with the conduct of which they had been honoured. The principal difference between the several deserts consisted in their greater or lesser distance from places where they could procure provisions; and in the inclemency of the weather, which was proportionate to the height of the mountains, and the season of the year.

They generally kept within their hut. Indeed they were obliged to do this, both on account of the intenseness of the cold, the violence of the wind, and their being continually involved in so thick a fog, that an object at six or eight paces was hardly discernible. When the fog cleared up, the clouds by their gravity moved nearer to the surface of the earth, and on all sides surrounded the mountains to a vast distance, representing the sea, with their rock like an island in the centre of it. When this happened, they heard the horrid noises of the tempests, which then discharged themselves on Quito and the neighbouring country. They saw the lightnings issue from the clouds, and heard the thunders roll far beneath them: and whilst the lower parts were involved in tempests of thunder and rain, they enjoyed a delightful serenity; the wind was abated, the sky clear, and the enlivening rays of the sun moderated the severity of the cold. But their circumstances were very different when the clouds rose: their thickens rendered respiration difficult; the snow and hail fell continually; and the wind returned with all its violence; so that it was impossible entirely to overcome the fears of being, together with their hut, blown down the precipice, on whose edge it was built, or of being buried under it by the daily accumulations of ice and snow.

The wind was often so violent in these regions, that its velocity dazzled the sight, whilst their fears were increased from the dreadful concussions of the precipice, caused by the fall of enormous fragments of rocks. These cruises were the more alarming, as no other noises are heard in these deserts; and during the night, their rest, which they so greatly wanted, was frequently disturbed by such sudden sounds. When the weather was any thing fair with them, and the clouds gathered about some of the other mountains which had a connection with their observations, so that they could not make all the use they desired of this interval of good weather, they left their hut to exercise themselves. Sometimes they descended to some small distance; and at others, amused themselves with rolling large fragments of rocks down the precipice; and these frequently required the joint strength of them all, though they often saw the same effected by the mere force of the wind. But they always took care in their excursions not to go so far out, but that on the least appearance of the clouds gathering about their cottage, which often happened very suddenly, they could regain their shelter. The door of their hut was fastened with thongs of leather, and on the inside not the smallest crevice was left unstopped; beside which, it was very compactly covered with straw: but, notwithstanding all their care, the wind penetrated through. The days were often little better than the nights; and all the light they enjoyed was that of a lamp or two, which they kept continually burning.

Though their hut was small, and crowded with inhabitants, beside the heat of the lamps; yet the intenseness of the cold was such, that every one of them was obliged to have a chafing-dish of coals. These precautions would have rendered the rigour of the climate supportable, had not the imminent danger of perishing by being blown down the precipice roused

them, every time it snowed, to encounter the severity of the outward air, and fall out with shovels to free the roof of their hut from the masses of snow which were gathering on it. Nor would it, without this precaution, have been able to support the weight. They were not indeed without servants and Indians; but these were so numbed with the cold, that it was with great difficulty they could get them out of a small tent, where they kept a continual fire. So that all our artificers could obtain from them was to take their turns in this labour; and even then they went very unwillingly about it, and consequently performed it slowly.

It may easily be conceived what this company suffered from the aperties of such a climate. Their feet were swelled; and so tender, that they could not even bear the heat; and walking was attended with extreme pain. Their hands were covered with chilblains; their lips swelled and chapped; so that every motion in speaking, or the like, drew blood; consequently they were obliged to strict taciturnity, and little disposed to laugh, as, by causing an extension of the lips, it produced such afflures as were very painful for two or three days after.

Their common food in this inhospitable region was a little rice boiled with some flesh or fowl, procured from Quito; and, instead of fluid water, their pot was filled with ice; they had the same resource with regard to what they drank; and while they were eating, every one was obliged to keep his plate over a chafing-dish of coals, to prevent his provisions from freezing. The same was done with regard to the water. At first they imagined the drinking strong liquors would diffuse a heat through the whole body, and consequently render it less sensible of the painful sharpness of the cold; but, to their surprise, they felt no manner of strength in such liquors, nor were they any greater preservative against the cold than the common water.

At the same time they found it impossible to keep the Indians together. On their first feeling of the climate, their thoughts were immediately turned on deserting their masters. The first instance they had of this kind was so unexpected, that, had not one, of a better disposition than the rest, staid and acquainted them of their design, it might have proved of very bad consequence. The affair was this: There being on the top of the rock no room for pitching a tent for the Indians, they used every evening to retire to a cave at the foot of the mountain; where, beside a natural diminution of the cold, they could keep a continual fire; and, consequently, enjoyed more comfortable quarters than their masters. Before they withdrew at night, they fastened, on the outside, the door of the hut, which was so low that it was impossible to go in or out without stooping; and as every night the hail and snow which had fallen formed a wall against the door, it was the business of one or two of the Indians to come early and remove this obstruction. For though the negro servants were lodged in a little tent, their hands and feet were so covered with chilblains, that they would rather have suffered themselves to have been killed than move. The Indians therefore came constantly up to dispatch this work betwixt nine or ten in the morning: but they had not been there above four or five days, when they were not a little alarmed to see ten, eleven, and twelve o'clock come, without any news of their labourers; when they were relieved by the honest servant mentioned above, who had withstood the seduction of his countrymen, and informed his masters of the desertion of the four others. As soon as the snow was cleared away from the door, they dispatched the Indian to the corregidor of Quito, who with equal dispatch sent other Indians, threatening to chastise them severely if they were wanting in their duty.

But the fear of punishment was not sufficient to induce them to support the rigour of this situation; for within two days they deserted. The corregidor therefore, to prevent any other inconvenience, sent four Indians under the care of an alcaide, and gave orders for their being relieved every fourth day.

Twenty-three tedious days our artists spent on this rock, *viz.* to the 6th of September, and even without any possibility of finishing their observations of the angles: for, when it was fair and clear weather with them, the others, on whose summits the signals which formed the triangles for measuring the degrees of the meridian, were hid in the clouds; and when those were clear, Pichincha was involved in clouds. It was therefore necessary to erect their signals in a lower situation, and in a more favourable region. This however did not produce any change in their habitation till the beginning of December; when, having finished the observations which particularly concerned Pichincha, they proceeded to others; but with no abatement either of inconveniences, cold, or fatigue; for the places where they made their observations being necessarily on the highest parts of the deserts, the only respite in which they enjoyed some little ease, was during the short interval of passing from one to the other.

In all their stations subsequent to that on Pichincha, during their fatiguing mensuration of the degrees of the meridian, each company lodged in a field-tent, which, though small, they found less inconvenient than the hut on Pichincha; though at the same time they had more trouble, being oftener obliged to clear it from the snow, as the weight of it would otherwise have demolished the tent. At first, indeed, they pitched it in the most sheltered places; but on taking a resolution that the tents themselves should serve for signals, to prevent the inconvenience of having others of wood, they removed them to a more exposed situation, where the impetuosity of the winds sometimes tore up the piquets, and blew them down.

Though this mountain is famous for its great height, it is considerably lower than the mountain of Cotopaxi: but it is impossible to conceive the coldness of the summit of the last-mentioned mountain, from that felt on this; since it must exceed every idea that can be formed by the human mind, though they are both seated in the midst of the torrid zone. In all this range of mountains, there is said to be a constant inferior boundary, beyond which the snow never melts: this boundary, in the midst of the torrid zone, is said by some to be 2434 fathoms above the level of the sea; by others, only 2400 feet. The snow indeed falls much lower, but then it is subject to be melted the very same day. It is affirmed, that there are in the Andes sixteen volcanoes or burning mountains, which throw out fire and smoke with a terrible noise. The height of Chimborazo, said to be the highest peak of the Andes, has been determined by geometrical calculations to be 20,282 feet. But the great differences between the calculators of the height of mountains in other parts of the world, must very much diminish the credit of such calculations. Instances of this we have already given under the article *ÆTNA*. No less remarkable are the differences concerning the height of the peak of Teneriffe; which, according to the calculations of Varenus, is three miles and three quarters, or 19,800 feet; according to those of Dr. Heberden, it is only 15,396 feet; and according to those of M. Feuille, is no more than 13,128 feet. From these specimens, we can scarce avoid concluding, that all the methods hitherto invented for calculating the exact height of mountains are insufficient.

As all or most rivers have their source in mountains, it is no wonder a great number run down the sides of the Andes,

Some hurry along with a prodigious rapidity; whilst others form beautiful cascades, or run through holes in rocks, which look like bridges of a stupendous height. There is a public road through the mountains, 1000 miles in length, part of which runs from Quito to Cusco.

ANDETRIUM; ANDRETIUM (Strabo); ANDECRUM, or ADDECRUM (Ptolemy); an inland town of Dalmatia. The genuine name is *Andetrium* (Inscription). It is described as situated near Salone, on a naturally strong and inaccessible rock, surrounded with deep valleys, with rapid torrents; from which it appears to be the citadel now called *Cliffa*. E. Long. 17. 46. Lat. 43. 20.

ANDOMADUNUM; ANDOMATUNUM (Ptolemy); and ANTEMATUNUM (Antonine); CIVITAS LINGONUM (Tacitus); a city of Gallia Belgica; now *Langre*; in Chanpagne, situated on an eminence (which seems to justify the termination *dunum*), on the borders of Burgundy, at the springs of the Marne. Tacitus calls an inhabitant *Lingon*. E. Long. 5. 22. N. lat. 48. o.

ANDRARUM, a town of Sweden, in Gothland, three miles S. of Christianstad: here is the greatest alum-work in the kingdom.

ANDREAS (John), a celebrated canonist in the 14th century, was born at Mugello, near Florence; and was professor of canon law at Padua, Pisa, and afterwards at Bologna. It is said that he macerated his body with fasting; and lay upon the bare ground every night for twenty years together, covered only with the skin of a bear. Andreas had a beautiful daughter, named *Novella*, whom he loved extremely; and he is said to have instructed her to well in all parts of learning, that when he was engaged in any affair which hindered him from reading lectures to his scholars, he sent his daughter in his room; and left her beauty should prevent the attention of the hearers, she had a little curtain drawn before her. To perpetuate the memory of this daughter, he entitled his Commentary upon the Decretals of Gregory IX. the *Novellæ*. He married her to John Calderinus, a learned canonist. The first work of Andreas was his Gloss upon the sixth Book of the Decretals, which he wrote when he was very young. He wrote also Glosses upon the Clementines; and a Commentary in *regulas Sexti*, which he entitled *Mercuriales*, because he either engaged in it on Wednesdays (*diebus Mercurii*), or because he inserted his Wednesdays' disputes in it. He enlarged the Speculum of Durant, in the year 1347. This is all which Mr. Bayle mentions of his writings, though he produced many more. Andreas died of the plague at Bologna, in 1348, after he had been a professor forty-five years; and was buried in the church of the Dominicans. Many eulogiums have been bestowed upon him. He has been called *archiductor decretorum*: In his epitaph, *Rabbi doctorum; lux, censor, normaque morum*; "Rabbi of the doctors, the light, censor, and rule of manners." And it is said, that Pope Boniface called him *lumen mundi*, "the light of the world."

ANDREAS (John), was born a Mahometan, at Xativa in the kingdom of Valencia, and succeeded his father in the dignity of alfaqui of that city. He was enlightened with the knowledge of the Christian religion by being present at a sermon in the great church of Valencia on the day of Assumption of the blessed Virgin, in the year 1487. Upon this he desired to be baptized; and, in memory of the calling of St. John and St. Andrew, he received the name John Andreas. "Having received holy orders (says he), and, from an alfaqui and a slave of Lucifer, become a priest and minister of Christ; I began, like St. Paul, to preach and publish the contrary of what I had erroneously believed and asserted; and, with the assistance of Almighty God, I converted at first a

great many souls of the Moors, who were in danger of hell, and under the dominion of Lucifer, and conducted them into the way of salvation. After this, I was sent for by the most catholic prince, King Ferdinand, and Queen Isabella, in order to preach in Granada to the Moors of that kingdom, which their majesties had conquered: by God's blessing on my preaching, an infinite number of Moors were brought to abjure Mahomet, and to turn to Christ. A little after this, I was made a canon by their grace; and sent for again by the most Christian Queen Isabella to Arragon, that I might be employed in the conversion of the Moors of those kingdoms, who still persisted in their errors, to the great contempt and dishonour of our crucified Saviour, and the prodigious loss and danger of all Christian princes. But this excellent and pious design of her majesty was rendered ineffectual by her death." At the desire of Martin Garcia, bishop of Barcelona, he undertook to translate from the Arabic, into the language of Arragon, the whole law of the Moors; and after having finished this undertaking, he composed his famous work of *The Confusion of the Sect of Mahomed*: it contains twelve chapters, wherein he has collected the fabulous stories, impostures, forgeries, brutalities, follies, obscenities, absurdities, impossibilities, lies, and contradictions, which Mahomet, in order to deceive the simple people, has dispersed in the writings of that sect, and especially in the Alkoran, which, as he says, was revealed to him in one night by an angel, in the city of Meke; though in another place he contradicts himself, and affirms that he was twenty years in composing it. Andreas tells us, he wrote this work, that not only the learned amongst Christians, but even the common people might know the different belief and doctrine of the Moors; and on the one hand might laugh and ridicule such insolent and brutal notions, and on the other might lament their blindness and dangerous condition. This book, which was published at first in Spanish, has been translated into several languages; and all those who write against the Mahometans quote it very much.

ANDREINI (Isabella), a native of Padua, was an excellent poetess, and one of the best comedians in Italy, towards the beginning of the 17th century. The Intenti of Pavia thought they did their society an honour by admitting her a member of it; and she, in acknowledgement of this honour, never forgot to mention amongst her titles that of *Academica Infanta*: her titles were these, "Isabella Andreini, comica gelosa, academica infanta, detta l'accesa." She was also a woman of extraordinary beauty; which, added to a fine voice, made her charm both the eyes and ears of the audience. She died of a miscarriage at Lyons, the 10th of June, 1604, in the 42d year of her age. Her death being a matter of general concern and lamentation, there were many Latin and Italian elegies printed to her memory: several of these pieces were placed before her poems in the edition of Milan, in 1605. Besides her sonnets, madrigals, songs, and eclogues, there is a pastoral of hers entitled *Myrtilla*, and letters, printed at Venice in 1610. She sung extremely well, played admirably on several instruments, understood the French and Spanish languages, and was not unacquainted with philosophy.

ANDRELINUS (Publius Faustus), born at Forli in Italy. He was a long time professor of poetry and philosophy in the university of Paris. Lewis XII. of France made him his poet laureat; and Erasmus tells us he was likewise poet to the queen. His pen was not wholly employed in making verses; for he wrote also moral and proverbial letters in prose, which were printed several times. His poems, which are chiefly in Latin, are inserted in vol. I. of the *Deliciae Poetarum Italarum*. Mr. De la Monnoy tells us, "that Andrelinus, when he was but twenty-two years old, received the crown of laurel."

rel: that his love verses, divided into four books, entitled *Livia*, from the name of his mistress, were esteemed so fine by the Roman Academy, that they adjudged the prize of the Latin elegy to the author." He died in 1518. This author's manner of life was not very exemplary; yet he was so fortunate, says Erasmus, that though he took the liberty of rallying the divines, he was never brought into trouble about it.

ANDREW (St.), the apostle, born at Bethsaida in Galilee, brother to Simon Peter; he was a zealous preacher of the gospel in several countries; and sealed it with his blood at Patrae, a city of Achaia, suffering martyrdom with great heroism, A.D. 69.

ANDREW (St.), a town of Germany, in the duchy of Carinthia, with a bishop's see; seated on the river Levant, ninety-five miles S. by W. of Vienna. Long. 15. 10. E. Lat. 46. 52. N.

ANDREWS (Lancelot), bishop of Winchester, was born at London, in 1555, and educated at Cambridge. After several preferments, he was made bishop, first of Chichester, then of Ely, and, in 1618, was raised to the see of Winchester. This very learned prelate, who was distinguished by his piety, charity, and integrity, may be justly ranked with the best preachers and completest scholars of his age; he appeared to much greater advantage in the pulpit than he does now in his works, which abound with Latin quotations and trivial witticisms. His sermons, though full of puns, were suited to the taste of the times in which he lived, and were consequently greatly admired. He was a man of polite manners and lively conversation; and could quote Greek and Latin authors, or even pun, with King James. This great prelate was in no less reputation and esteem with King Charles I, than he had been with his predecessors. He died at Winchester-house in Southwark, September 27, 1626, in the twenty-first year of his age; and was buried in the parish-church of St. Saviour's, where his executors erected to him a very fair monument of marble and alabaster, on which is an elegant inscription, in Latin, written by one of his chaplains. Mr. Milton also, at seventeen years of age, wrote a beautiful elegy on his death, in the same language. Bishop Andrews had, 1. A share in the translation of the Pentateuch, and the historical books from Joshua to the first book of Chronicles exclusively. He also wrote, 2. *Tortura Torti*, in answer to a work of Cardinal Bellarmine, in which that cardinal assumes the name of Matthew Tortus. 3. A Manual of Private Devotions; and, 4. A Manual of Directions for the Visitation of the Sick; besides the Sermons and Tracts, in English and Latin, published after his death.

ANDROGEUS, in fabulous history, the son of Minos king of Crete, was murdered by the Athenian youth and those of Megara, who envied his being always victor at the Attic games. Minos, having taken Athens and Megara, obliged the inhabitants to send him an annual tribute of seven young men and as many virgins, to be devoured by the Minotaur; but Theseus delivered them from that tribute.

ANDROMACHUS'S TREACLE, in PHARMACY, an article but lately expunged from the College Pharmacopoeia, as containing above fifty ingredients, some of them opposite in their qualities. The leading articles, however, being *opium* and *spices*, it proved, in many complaints, particularly of the aged, a very useful medicine, and was therefore retained in the Dispensatory long after its composition was a subject of ridicule among the profession.

ANDRONICUS I. emperor of the East, caused Alexis II. who had been put under his care, to be strangled; and then took possession of the throne of Constantinople, in 1183; but the people, becoming exasperated at his cruelties, proclaimed

Isaac Angelus emperor, and put Andronicus in irons: they then thrust out his eyes; and, having led him through the city in an ignominious manner, hanged him.

ANDRONICUS of Cyrrhus, built, at Athens, an octagon tower, with figures carved on each side, representing the eight principal winds. A brais triton at the summit, with a rod in its hand, turned round by the wind, pointed to the quarter from whence it blew. From this model is derived the custom of placing weather-cocks on steeples.

ANEAU (Bartholomew), a native of Bourges in France, a man of eminent learning in the 16th century, educated under Melchior Volmar. He was professor at Lyons, where he propagated the doctrines of the reformation secretly for a long time: but on the festival of the Holy Sacrament, 1565, as the procession was passing on towards the college, there was a large stone thrown from one of the windows upon the host and priest who carried it. The people, enraged at this, broke into the college, and assassinated Mr. Aneau, whom they imagined to have been the occasion, and the college itself was shut up next day by order of the city.

ANEGADA, one of the Caribbee Islands in America. W. long. 63. 5. N. lat. 18. 6. It is only remarkable for its humming birds, and beautifully coloured crabs of a delicate taste.

ANGERBURG, a handsome town in the kingdom of Prussia, defended by a strong castle, and seated on a lake of the same name.

ANGINA PECTORIS, in medicine, a disease extremely dangerous in its nature, and, by Dr. Heberden's account, not very rare. It seizes those who are subject to it, when they are walking, and particularly when they walk soon after eating, with a most disagreeable and painful sensation in the breast, which seems to threaten immediate destruction: but the moment they stand still, all the uneasiness vanishes. In all other respects, the patients, at the beginning of this disorder, are well, and have no shortness of breath; from which the common angina is totally different. After it has continued some months, the fits will not cease instantaneously on standing still; and it will come on not only when the patients are walking, but when they are lying down, and oblige them to rise up out of their beds every night, for many months together. In one or two very inveterate cases, it has been brought on by the motion of a horse, or carriage, and even by swallowing, coughing, going to stool, speaking, or by any disturbance of mind. The persons affected were all men, almost all of whom were above fifty years of age, and most of them with short necks, and inclining to be fat. Something like it, however, was observed in one woman, who was paralytic; and one of two young men complained of it in a very slight degree. Other practitioners have observed it in very young persons.

When a fit of this sort comes on by walking, its duration is very short, as it goes off almost immediately upon stopping. If it comes on in the night, it will last an hour or two. Dr. Heberden met with one in whom it once continued for several days: during all which time the patient seemed to be in imminent danger of death. Most of those attacked with the disease died suddenly: though this rule was not without exception; and Dr. Heberden observed one who sunk under a lingering illness of a different nature.

The *os sterni* is usually pointed to as the seat of this malady; but it seems as if it was under the lower part of that bone, and at other times under the middle or upper part, but always inclining more to the left side; and in many cases there is joined with it a pain about the middle of the left arm, which appears to be seated in the biceps muscle.

The appearance of Dr. Heberden's paper in the Medical

Transactions very soon raised the attention of the faculty, and produced other observations from physicians of eminence; namely, Dr. Fothergill; Dr. Wall, of Worcester; Dr. Haygarth, of Chester; and Dr. Percival, of Manchester. It also induced an unknown sufferer under the disease to write to Dr. Heberden a very sensible letter, describing his feelings in the most natural manner: which, unfortunately, in three weeks after the date of this anonymous epistle, terminated in a sudden death, as the writer himself had apprehended.

The youngest subject that Dr. Fothergill ever saw afflicted with this disorder was about thirty years of age; and this person was cured. The method that succeeded with him was a course of pills, composed of the mass of gum pill, soap, and native cinnabar; with a light chalybeate bitter: this was continued for some months; after which he went to Bath several successive seasons, and acquired his usual health: he was ordered to be very sparing in his diet; to keep the bowels open; and to use moderate exercise on horseback, but not to take long or fatiguing walks.

The only symptom in this patient that is mentioned, was a stricture across the chest, which came on if he was walking up hill, or a little faster than ordinary, or if he was riding a very brisk trot; for moderate exercise of any kind did not affect him; and this uneasy sensation always obliged him to stop, as he felt himself threatened with immediate death if he had been obliged to go forward.

It is the sharp constrictive pain across the chest, that (according to Dr. Fothergill's observation) particularly marks this singular disease; and which is apt to supervene upon a certain degree of muscular motion, or whatever agitates the nervous system.

In such cases as fell under the inspection of Dr. Fothergill, he very seldom met with one that was not attended with an irregular and intermitting pulse; not only during the exacerbations, but often when the patient was free from pain and at rest: but Dr. Heberden observes, that the pulse is, at least sometimes, not disturbed; and mentions his having once had an opportunity of being convinced of this circumstance, by feeling the pulse during the paroxysm.

But no doubt these varieties, as well as many other little circumstances, will occur in this disease as they do in every other, on account of the diversity of the human frame; and if those which in general are found to predominate and give the distinguishing character be present, they will always authorize us in giving the name to the disease: thus when we find the constrictive pain across the chest, accompanied with a sense of strangling or suffocation; and still more if this pain should strike across the breast into one or both arms; we should not hesitate to pronounce the case an *angina pectoris*.

As to the nature of this disease, it appears to be purely *spasmodic*; and this opinion will readily present itself to any one who considers the sudden manner of its coming on and going off; the long intervals of perfect ease; the relief afforded by wine, and spirituous cordials; the influence which passionate affections of the mind have over it; the ease which comes from varying the posture of the head and shoulders, or from remaining quite motionless; the number of years for which it will continue, and other otherwise disordering health; its bearing to well the motion of a horse or carriage, which circumstance often distinguishes spasmodic pains from those which arise from ulcers; and lastly its coming on for the most part after a full meal, and in certain patients at night, just after the first sleep, at which time the incubus, convulsive asthma, and other ills, justly attributed to the disordered functions of the nerves, are peculiarly apt to return, or to be aggravated.

From all these circumstances taken together, there can be

little doubt that this affection is of a spasmodic nature: but though it should be admitted, that the whole distress in these cases arises from spasm, it may not be so easy to ascertain the particular muscles which are thus affected.

The violent sense of strangling or choking, which shews the circulation through the lungs to be interrupted during the height of the paroxysm; and the peculiar constrictive pain under the sternum, always inclining (according to Dr. Heberden's observation) to the left side; together with that most distressing and alarming sensation, which, if it were to increase or continue, threatens an immediate extinction of life, might authorize us to conclude, that the heart itself is the muscle affected: the only objection to this idea, and, if it had been constantly observed, it would be insurmountable, is, that the pulse is not always interrupted during the paroxysms. The appearances in two of the dissections, favour the opinion that the spasm affects the heart; as in one subject the left ventricle (and, though it be not mentioned, we may presume the right one also) was found as empty of blood as if it had been washed; and in another, the substance of the heart appeared whitish, not unlike a ligament; as it should seem, in both cases, from the force of the spasm squeezing the blood out from the vessels and cavities.

If this hypothesis be allowed, we must conclude that the spasm can only take place in an inferior degree, as long as the patient continues to survive the paroxysm; since an affection of this sort, and in this part, of any considerable duration or violence, must inevitably prove fatal: and accordingly, as far as could be traced, the persons who have been known to labour under this disease have in general died suddenly.

The dissections also shew, that whatever may be the true state of the spasm, it is not necessary for the bringing of it on, that the heart, or its immediate appendages, should be in a morbid state; for in three out of the six that have as yet been made public, these parts were found in a sound state.

On opening the body of the poor gentleman who wrote the letter to Dr. Heberden, "upon the most careful examination, no manifest cause of his death could be discovered: the heart, in particular, with its vessels and valves, were all found in a natural condition."

In the case communicated by Dr. Percival to the publishers of the Edinburgh Medical Commentaries, "the heart and aorta defendens were found in a sound state." And in Dr. Haygarth's patient, "on opening the thorax, the lungs, pericardium, and heart, appeared perfectly found." Not to mention Dr. Fothergill's patient (R. M.), in whose body the only morbid appearance about the heart was a small white spot near the apex. So that the cause, whatever its nature might have been, was at too great a distance, or of too subtle a nature, to come under the inspection of the anatomist. But there was a circumstance in two of the subjects that is worthy of remembrance; and which shews that the crasis of the blood, while they were living, must have been greatly injured, namely, its not coagulating, but remaining of a cream-like consistence, without any separation into serum and crassamentum.

From all that we have seen hitherto published, it does not appear that any considerable advances have been made towards the actual cure of this anomalous spasm.

The very judicious and attentive Dr. Heberden (to whom the public are highly indebted for first making the disorder known) confesses, that bleeding, vomits, and other evacuations, have not appeared to do any good: wine and cordials, taken at bed-time, will sometimes prevent or weaken the fits; but nothing does this so effectually as opiates: in

short, the medicines usually called *nervous* or *cordial*, such as relieve and quiet convulsive motions, and invigorate the languishing principle of life, are what he recommends.

Dr. Wall mentions one patient, out of the twelve or thirteen that he had seen, who applied to him early in the disease, and was relieved considerably by the use of antimonial medicines joined with the fetid gums: he was still living at the time the doctor wrote his paper (November, 1772), and going about with tolerable ease. Two were carried off by other disorders; all the rest died suddenly.

Dr. Fothergill's directions are chiefly calculated with the view to prevent the disorder from gaining ground, and to alleviate present distress. Accordingly he enjoins such a kind of diet as may be most likely to prevent irritability: in particular, not to eat voraciously: to be particularly abstemious in respect to every thing heating; spices, spirits, wines, and all fermented liquors: to guard most scrupulously against passion, or any vehement emotions; and to make use of all the usual means of establishing and preserving general health: to mitigate excesses of irritability by anodynes; or pains, if they quicken the circulation: to disperse flatulencies when they distend the stomach, by moderate doses of carminatives; amongst which, perhaps, simple peppermint-water may be reckoned one of the safest. But since obesity is justly considered as a principal predisposing cause, he insists strongly on the necessity of preventing an increase of fat, by a vegetable diet, and using every other practicable method of augmenting the thinner secretions.

These were the only means that occurred to the English physicians of opposing this formidable disease: but Dr. Smyth, of Ireland, has, we are told, discovered that it may certainly be cured by issues, of which Dr. Macbride gives some striking instances. When these are tried in any case, they should be placed inter scapulas, and kept open by horribans, so as to produce a copious discharge.

ANGLUS (Thomas), an English priest, well known for the singularity of his opinions, and several little traits which he wrote, in the 17th century. He went by several names. Mr. Baillet says his true name was *White*; but that he used to disguise it under that of *Candidus*, *Albius*, *Bianchi*, and *Rickworth*; but he was most known in France by the name of *Thomas Anglus*. Des Cartes generally called him Mr. *Vitus*. He passed some time in most countries of Europe; but his longest stay was at Rome and Paris. When he was in England, he lived a considerable time in the family of Sir Kenelm Digby; and seems to have had a great esteem for the opinions of this gentleman, as may be seen in his writings, particularly in the Preface to his Latin work concerning the Institutions of the Peripatetic Philosophy, according to the hypothesis of Sir Kenelm. He was a great advocate for the peripatetic Philosophy. He attempted even to make the principles of Aristotle subservient to the explaining the most impenetrable mysteries of religion; and with this view, he engaged in the discussion of predestination, free-will, and grace. Mr. Baillet says, "What he wrote upon this subject resembles the ancient oracles for obscurity." In such obscure points as we have mentioned, he was much embarrassed; and, by giving too great scope to his own thoughts, he pleased neither the Molinists nor Janenists. He is allowed, however, to have been a man of an extensive and penetrating genius. On the 10th of June, 1658, the congregation of the Index Expurgatorius at Rome condemned some treatises of Thomas Anglus. The doctors of Douay censured also twenty-two propositions extracted from his Sacred Institutions. He published his *Supplicatio populi utraque iustitie*, in opposition to their censure; where-in he complains that they had given him a vague undetermined censure, without taxing any particular proposition. He

died some time after the restoration of Charles II. but in what year is uncertain.

ANGRIVARI (Tacitus), a people of Germany, situated between the Weser and the Ems, and eastward reaching beyond the Weser, as far as the Cherufci, on which side they raised a rampart (Tacitus); to the south, having the Tubantes on the Ems, and on the Weser where it bends to the forest Bacemias; to the west, the Ems and the confines of the Bructeri; and to the north, the territory of the Angrivarii lay between the Chamavi and Ansibarii. Ptolemy places them between the Cauchi and Suevi or Catti. Supposed now to contain a part of the county of Schaumburg, the half of the bishopric or principality of Minden; to the south, the greatest part of the bishopric of Osnaburg, the north part of the county of Teclenburg, and a part of the county of Ravensberg. A trace of the name of the people still remains in the appellation *Engern*; a small town in the county of Ravensberg.

ANGROGNA, a town of Piedmont, belonging to the king of Sardinia. E. long. 7. 2. N. lat. 48. 42.
